CANADIAN MINING JOURNAL

Vol. XL. January—December 1919

Authors PAGE

Ashworth, James 901, 933
Burns, C. H. McL. 823
Burrows, A. G. 83
Cole, L. Heber 8, 346
Cavers, T. W. 82
Cantley, Col., Thomas 332
Cooke, H. C. 519
Carter, Wm. 808, 826
Dowling, D. B. 217
Davis, J. W. 36
Gray, F. W. 4, 73, 606, 986
Geddes, Sir Auckland 618
Gibson, Thomas W. 183
Gwillim, J. C. 198, 291, 453
Galloway, John D. 230
Hopkins, Percy E. 68
Hodge, Edwin T. 258
Hore, Reginald E. 490, 519, 582, 677, 749, 830, 948
Haliburton, E. D. 589, 946
Knight, C. W. 83, 399, 772
Lanza, A. J. 261
Ledoux, A. 603
Lury, Justin S. De. 712
Ladoo, Raymond B. 914
Mc Callum, Dr. A. B. 28
Mc Rae, J. A. 43, 147, 419, 851, 854, 956
Munroe, Jas. P. 159
Moffatt, Jas. W. 207
Morley, Lt. G. H. 341
Mc Lean, F. A. 630, 718, 967
Murray, J. C. 715
Mailhiot, Adhemar 765
Neale, Jas. B. 214
O'Connor, J. J. 831, 858, 952
Piers, Harry 285
Percival, J. Barkley 435
Picard, Hugh K. 542
Probert, Frank K. 656
Pearce, M. C. 673, 693
Parker, D. J. 735
Purves, Jas. 804
Rickard, T. A. 238
Rutledge, J. J. 401
Russel, H. Y. 561
Stansfield, Dr. A. 54
Spence, Hugh S. 62
Spearman, Charles 87, 586
Sanderson, H. H. 539
Swan, A. W. 787
Thomson, F. A. 602
Wotherspoon, W. L. 72
Wilson, Herbert M. 160
Wallace, R. C. 549, 731, 843
Williams, Dr. M. Y. 655
Watts, John S. 886
Wallin, C. E. 970

Editorials

(A)

Are the Programmes of Technical Society Meetings Too Crowded? 879
An Unjustified Assumption 917
Asiatic Coal Supremacy 729
A Revival of Technical Literature 783
Activity in Nova Scotia Coal Trade 784
A Real Minister of Mines 709
A Typical Case 433
A Suggestion 220
A Monopoly to Shell Company 2
Are We Making the Most of Our Opportunity? 17
A Fair Day's Work for a Fair Day's Pay 18
Amendents to Mines Act of Ontario 81
An Opportunity for C. M. I. to Serve the Industry 97

PAGE

A Misleading Prospectus 99
Annual Meeting C. M. I. 131
Aerial Transport in Mining Districts 113

(B)

Bursaries for Mining Students 964
Boom in Pulp & Paper Incorporations 784
Britain's Debts Will be Paid 803
Bad Housing and Anarchy 578
British Trade Fairs 398
Better Roads for Mining Camps 366

(C)

Christmas 1919 945
Canadian Mining Institute Meeting at Vancouver 802
Cobalt Strike—Statement of Mine Managers 635
Cobalt Strike Ended 671
Cobalt Strike 555
Canada's Coal Insufficiency 517, 556
Canadian Mining Institute's Prospecting Plan 577
Cooperative Retail Associations 615
C.N.R. and Purchase of Nova Scotia Coal 616
Canadian Coal & Iron and the Tariff 269
Class Legislation for Engineers 269
Cobalt Silver Mines 299
Canadian Day at the A.I M Meeting 114

(D)

Development of Mineral Deposits 219
Develop Claims or Forfeit Them 311
Does Leasehold System Keep Capital Out of Manitoba? 1
Decentralization in the Coal Mining Industry 469
Damning with Faint Praise 763

(E)

Echoes from C.M.I. Annual 163
Expansion of Gold Mining in N. Ontario 299
Explosion of Black Powder at Baltimore Mine 414
Education of Citizenship 577
Europe's Diminished Coal Production 599

(F)

Federal Embargo on Gold Exports 398
Further Decrease in British Coal Production 431
Forgotten Historical Events 449
Future of British Collieries 636
Free Competition in Coal Mining Undesirable 841

(G)

Granting Monopoly by Order in Council 31
Government Exploration for Minerals 284
Geological Mapping of Mineral Areas 298
Geological Survey Reports 325
Growth, Not Reconstruction 598
Graphical Summary of the Chronology and Progress of Canadian Mining 897

(H &I)

Hoisting Men in B.C. Mines 653
Italy Utilizes Volcanic Power 132
Increased Activity in Gold Mining 311
Insurance Against Mine Inundation 709

CANADIAN MINING INSTITUTE.

The 21st annual meeting of the Canadian Mining Institute will be held in Montreal on March 5th, 6th and 7th, 1919. Arrangements are being made to make the occasion a memorable one. Members will have an opportunity to celebrate fittingly the successful conclusion of the war. It is hoped that many soldier members will be back home in time for the meeting.

MANITOBA BRANCH C. M. I.

A meeting of the Manitoba branch of the Canadian Mining Institute was held in Winnipeg on December 17. Dr. R. C. Wallace, Commissioner of Northern Manitoba was in the chair. There was a dinner, followed by a business meeting and a talk on the resources of Northern Manitoba, by J. A. Campbell, former Commissioner. There was a good representation from The Pas, including H. C. Carlisle, manager of the Mandy mine, and R. Neal, manager of the Rex mine.

DOES LEASEHOLD SYSTEM KEEP CAPITAL OUT OF MANITOBA?

By an Order-in-Council passed in 1917, the Dominion Government adopted the policy of granting leases in place of title to all minerals naturally occurring in quartz. The effect of this Order-in-Council has been well pointed out by Dr. R. C. Wallace, Mining Commissioner of Northern Manitoba. Dr. Wallace writes in part:

"Manitoba is more directly concerned in this change in policy than any other territory to which the federal laws are applicable. In Saskatchewan and Alberta the mining of gold and copper is as yet negligible. In the Yukon territory placer mining—to which other laws apply—is still the most important industry. In Manitoba, however, the future of the mining industry will rest with the success with which quartz claims—for copper, gold, tungsten, and other precious minerals—will be operated. It is consequently of fundamental importance that the legislative control should be of such a nature that the industry in its infant stage should be encouraged and stimulated, and that a fair field should be safeguarded for the employment of capital from outside sources. The United States of America will undoubtedly supply the greater part of the capital on which Manitoba must depend for the development of her resources for many years to come. Under the Federal laws of the United States, as we have seen, the investor in mineral properties may obtain a title, and thus feel himself secure from interference in the development of his domain. It may be, of course, that this situation will not obtain for many years longer. In 1907, a special commissioner was appointed by Congress to investigate the actual working out of the leasehold system of mineral tenure, as practised throughout Australia and New Zealand. His report was an unqualified endorsation of the leasing system. Mining engineers, promoters and capitalists in Australia and New Zealand were practically unanimously of the opinion that their system of government leasehold of minerals, involving bona-fide development, was a practical success. Their verdict was all the more striking in view of the fact that in all the earlier days of mining in Australia the policy of alienation of mineral lands was in vogue; and even to-day in New Zealand the operator has the option of purchase, an option which is very seldom exercised. In view of this report, and official opinion quoted elsewhere, there is at least some foundation for the belief that the Federal laws dealing with natural resources may yet be modified. As the situation now is, however, the American capitalist who is looking for favorable fields for investment abroad is accustomed to the freehold system at home. He finds that in the already established mineral territories of Ontario to the east, and British Columbia to the west, he may obtain possession outright of the properties in which he may desire to invest his capital; while in Manitoba, a field which has undoubtedly great promise, but where the industry has not yet reached a sound footing, he can secure only a long term lease. There is a very strong feeling among practically all classes of mining men throughout the Province that, as the situation stands, it is more difficult to attract capital into mining investments than it would be were it possible to offer the security of freehold tenure. The development of a sound mining industry in the Province is of vital importance for the industrial life of the City of Winnipeg, and for the commercial future of a community which can only in part be dependent on agricultural expansion and all who are concerned that the foundations of our economic structure be truly laid, will be well advised to give thought to the conditions which this growing industry has to face.

"We may perhaps legitimately assume that the force of democratic feeling is behind the system of leasehold tenure whereby a certain measure of control is retained by the people at large. The logical conse-

quences of adoption of a leasing system are not so generally realized. If the people retain the ownership, they must also assume the obligation that development will be assisted by all means in their power. If we rent a house, we expect that the owner will see to it that the business of living in the house is made not merely tolerable, but reasonably pleasant. On a similar basis, the Dominion Government, by adopting a leasehold in place of a freehold system for minerals naturally occurring in quartz, has thereby tacitly assumed the responsibility of assisting mineral development to a much greater extent than heretofore; and if a similar system were to be adopted by the Western Provinces when their resources are handed over, the argument would apply with still greater force. The success which has marked the progress of the mineral industry in Australia and New Zealand under the leasehold system has been in large measure due to the fact that the various Governments have shown the greatest enterprise in providing transportation facilities into new camps, in erecting Government smelters and stamp batteries, and in assisting prospecting. In Manitoba the success of the mining industry rests first and foremost with the prospector. Nothing that will hamper his activities should be permitted to stand. Apart from the question of the system of tenure, the Dominion laws are particularly favorable to him, in comparison with certain laws that obtain in the Provinces. He would be compelled to admit that the erstwhile freehold system promoted a species of real estate gambling in mining prospects, which was not in the interests of the development of a sound mining industry. If, however, he does not receive specific assurance that under the leasehold system the Government will always stand ready to assist—within its own sphere of action—in developing all prospects that show good promise of success, he is justified in view of existing conditions in petitioning for a repeal of the leasing clause."

The experience of a year under the leasehold system has evidently convinced mining men in Manitoba that the Dominion Government does not take proper care of its tenants. They wish, therefore, to purchase title to the mining lands on which they spend money and labor.

SALT IN NOVA SCOTIA.

In a recent number we published a short item from one of our Nova Scotia correspondents, announcing that salt had been discovered near Malagash, Cumberland Co., Nova Scotia. We are fortunately able in this number to give some account of the history of this important discovery. Mr. L. H. Cole, of the Mines Branch, who has written the article, has devoted considerable attention to the salt mining industry. He is the author of the report on salt deposits and the salt industry of Canada, which was published by the Mines Branch in 1915.

There is something peculiarly appropriate in this discovery of salt in Nova Scotia. At present no salt is being produced in the Maritime Provinces, and the fishing industry has to depend on imports from across the Atlantic. We have good salt in Ontario, but the freight rate to the Atlantic is prohibitive. A large tonnage of salt is used in the fishing industry, and it now seems likely that Nova Scotia will produce it.

Another interesting feature of the discovery is the evidence of close co-operation between the prospectors and the Mines Branch. Mr. Cole is to be congratulated on the practical assistance he has given.

While Ontario produces must salt, there is no actual mining of rock salt in Canada. The salt in Ontario is obtained by pumping brines, natural or artificially made from rock salt at depth. The Nova Scotia salt beds are, however, near the surface. Rock salt mining may soon be added to our industries,

A MONOPOLY TO SHELL COMPANY?

According to a despatch from Ottawa, the Government has under consideration a proposal to give to the Shell Transport & Trading Company, Limited, a concession to enter upon and develop all the oil-bearing lands in the Province of Alberta, north of the Athabasca River. The concession is to be in the nature of a monopoly for five years, except that the rights of leaseholders and prospectors already there are to be respected. In return the company is to pipe the oil to Vancouver or to the head of the lakes, and after receiving six per cent. on its investment is to divide the remaining profits equally with the Government.

There will be considerable difference of opinion in this matter. It is generally recognized that Canada and the British Empire produce a lamentably small proportion of the oil consumed. There will therefore be much gratification if a great effort is made to speed up exploration for oil in Western Canada. On the other hand it is inadvisable that any company be given a monopoly. If the company is not willing to take the same chances as others who explore new areas in Canada it will find few friends in this country. We believe that every assistance reasonably possible should be given to exploration companies; but we would not like to see such assistance take the form of special privileges to certain companies.

The proposal as unofficially outlined in the news from Ottawa is one that should receive attention from the orginazation which represents the mining industry, namely the Canadian Mining Institute. If the Shell Company is willing to spend a large sum of money in exploring lands that are now unproductive, it would be folly to ask the Government to turn down the proposal without giving it serious consideration. Possibly a way might be found to meet the wishes of the company without making a foolish bargain.

FREEHOLD OR LEASEHOLD?

At a recent meeting of the Manitoba branch of the Canadian Mining Institute there was an important discussion on the relative merits of the freehold and leasehold system of tenure of mining lands. The opinion of the meeting was that the development of Manitoba's mineral resources would be accomplished much more rapidly if the freehold system were adopted.

Some months ago the law governing tenure of mining lands was discussed at a convention in Port Arthur, and the result of the discussion was similar to that at Winnipeg—a resolution in favor of the freehold system being passed.

Some years ago the Canadian Mining Institute, in framing proposals for a Dominion mining law, favored the leasing system. There is evidently no unanimity in opinion on this point, however, and it would be well to have the matter reconsidered.

Manitoba's mineral lands are administered by the Dominion Government. The men who are showing most interest in developing Manitoba's mineral resources evidently do not like the leasehold system. What do those in other Provinces think about it? We would be pleased to have our readers submit their ideas for publication. Free expression of opinion should help the officers of the Canadian Mining Institute to decide whether the policy adopted some years ago is in the best interests of the industry.

THE METAL MARKETS.

The signing of the Armistice was immediately followed by a great change in conditions in the metal business. One of the first actions of most munitions makers was to cut down purchases of metals. This loss of the munitions market has since been followed by a flood of unused or partly worked metal that has been turned back on the market. Naturally there has been a slump in buying orders, and some fall in prices. While the stocks accumulated for munition manufacture remain on the market, no stability in prices need be expected. Quotations for the present are mostly nominal.

It is not to be expected that metals will fall to prewar prices again, or that the cost of production will soon be as low as it was. On the other hand, it may be anticipated that when price restrictions are removed and an open market again established, it will be shown that present prices are no longer warranted by the demand.

The removal of the price restrictions will be welcomed by most producers. There is little satisfaction in high quoted prices if buyers do not appear.

EDITORIAL NOTES.

A Commissioner for Ontario is to be appointed to succeed the late Mr. Reid. Why should we not have in London someone familiar with Canada's mining industry and the opportunities for development? A Commissioner who could give information that would lead to greater interest in England in our mining industry would be in a positon to render good service to the Province.

Now that Manitoba has begun to figure more largely as a producer of minerals, the administration of the mining lands becomes a very important matter. At present Manitoba's mining lands are administered by the Department of the Interior, Ottawa. Would not greater interest be taken in developing the resources of Manitoba if the Province had control of its mineral resources?

One of the ways in which Governments can assist in the development of our mineral resources is that of preparing maps and reports that will be used by prospectors. During the past summer the Ontario Bureau of Mines has had men in the field mapping an undeveloped area near Lake Abitibi. When prospectors go into this area next summer they will be able to take with them geological maps and reports that will enable them to spend their time to the best advantage.

If the Canadian Mining Institute were merely a scientific society, how many members would have gathered at Winnipeg on Dec. 19th to discuss matters of vital importance to the mining industry of that Province?

The Telkwa Collieries, situated on the line of the Grand Trunk Pacific Ry. Co., northern British Columbia, are finding some difficulty in keeping coal moving from the mine to provide the domestic needs of Prince Rupert city and the adjacent district. Mr. Jabe Ashman, the Superintendent, asserts that there is plenty of coal in the bunkers, but, because of bad roads and for other reasons, there has been delay in arranging for its transportation.

That the British Columbia collieries are exporting coal before fully providing for the domestic needs of the Province is a charge made by the civic authorities of New Westminster, B. C. In a recent discussion of the fuel situation in that city it was stated that the dealers did not have their normal supply of coal and, if exceptional conditions arose, a serious shortage might develop. It was decided that Mr. Nichol Thompson, Fuel Controller, be requested to see that all home demands were filled before the collieries were permitted to fill export orders. Incidentally the action of Mr. Thompson in allowing the dealers to raise their price to the consumer 65 cents a ton following an advance in miner's wages of 75 cents a day was criticized, it being pointed out that the per capita rate of coal production at the mine was 5½ tons a day. One of the aldermen, taking the viewpoint of the dealers, sarcastically observed that "it pays to increase wages."

Problems of Coal Mining Industry of Nova Scotia

Consolidation of Operating Companies is Advisable.

By F. W. GRAY.

As the year draws to a close the declining tendency of coal production is still in evidence, and indications are that the output of 1918 from the Nova Scotian coal mines will be less than the output of 1917 by between 400,000 and 500,000 tons. The reduction from the basis of 1913 has now reached 31 per cent, and no recovery is in sight.

The end of the war has turned men's thoughts to the readjustment which must take place in the change from production for war purposes and production for normal peace time consumption. So far, however, as the coal mines of Nova Scotia are concerned, there need not for a long time to come be any occasion for worry as to disposal of the product. The output of the Nova Scotian collieries in 1913 was 7,250,000 tons. In 1918 it will scarcely exceed 5,000,000 tons. These figures are sufficient in themselves to tell the tale, because in 1913, although from various causes connected with the development of the collieries themselves some recession in production was to be anticipated, no one anticipated that the peak of Nova Scotian coal production had been reached, or that the consumption of coal in Canada was a decreasing factor. It is to be presumed that the Nova Scotian operators intend to re-enter the Montreal market so soon as the rate of production and the availability of means of transportation will permit, and this market alone used to absorb 2,000,000 tons of Nova Scotia coal per year.

As the writer explained in detail in a recent article in the Canadian Mining Journal, there is some reason to expect a tendency among the non-British European nationalities now employed at the collieries to move away, and, as demobilization will necessarily be a protracted process, there is little reason to expect any large number of men to return to the collieries from the army service. It would seem advisable for the authorities in considering the problems of reconstruction to take steps to check any wholesale movement of foreign labor from the collieries, and at the same time to give preference in repatriation to skilled coal miners.

It is intimated that the Amalgamated Mine Workers of Nova Scotia intend at their Convention in Sydney shortly to join the United Mine Workers of America, and to formulate fresh demands for an increase in wages, and for working conditions based on the Pennsylvania schedules. It is not to be hoped that wise counsels will prevail and prevent the occurrence of any crisis at the year end, as it will be remembered that this particular controversy brought about the disastrous strikes of the years 1908 to 1910 in Nova Scotia.

The mine workers state they wish to receive wages equal to any other coal district in North America, but it is quite evident they cannot receive wages that will render mining an unprofitable business. The advances granted in miners' wages in Nova Scotia since 1916 run from 75 per cent to 100 per cent, and this fact, combined with the increase in the costs of materials, and the decrease in the proportion of productive workers compared with the auxiliary workers at the mines, has made the cost of mining high beyond experience or belief. As a matter of fact, if it were not that the larger companies combine the manufacture of steel with their coal-mining operations it would before this have been necessary to abandon the extraction of coal, as the selling price is lower than the cost of production. If the miners do not take these facts into consideration in formulating their demands at the end of this year, it is quite certain that they must be resisted by the coal operators.

The only possibility of reducing the cost of mining coal to reasonable figures that presents itself at this time is a restoration of the balance between producers and non-producers. This can be achieved in two ways, first, by the return of the skilled miners, or secondly, by concentrating the miners in fewer collieries, which will require the closing down of a number of the most expensive collieries, and the discharge from employment of a large number of non-productive laborers. The last-named procedure would without doubt result in larger outputs at lower costs per ton. The operators have been deterred from following this course during the war for obvious reasons, but so soon as the ordinary laws of supply and demand commence to operate, the figures on the balance sheets of the coal companies will leave them no alternative, because it is quite evident that no operator can mine coal and sell it for less than it is costing him, except for a very limited period.

There is scarcely any factor that will so speedily lead to a reduction in the cost of manufacturing and transportation, and therefore to a reduction in the cost of living, as a plentiful supply of cheap coal. A scarcity of coal, accompanied by high prices, must necessarily restrict all industry and transportation, and must bring about high prices everywhere. Coal is such a basic commodity that a disorganization of the labor occupied in coal mining exerts a much greater influence on the community at large than might at first sight be thought could be occasioned by the comparatively small number of men employed in the coal mining industry. A restoration of normal working forces at the collieries is therefore a desideratum of first class importance from the viewpoint of the whole country, and it is a matter that should receive the earnest consideration of the authorities.

It has taken the whole course of the war to educate the public and the authorities to the essential nature of coal in war operations, and it is to be hoped that now peace is here the equally essential nature of coal supply in relation to the problems of reconstruction will not be lost sight of.

There is another feature to this matter. The war must be paid for, and increased home production is one of the ways in which the money can be found. It surely is not to the advantage of Canada to have the coal output of Nova Scotia continuing at an annual reduction of 2½ millions of tons. As the writer has previously pointed out, the decrease must be filled from the outside, and it helps to pile up an adverse trade balance against Canada, altogether unnecessarily.

Further, a large part of the coal production of Nova Scotia is today coming from small collieries commenced during the war. These enterprises are, in the writer's opinion, ephermeral, and must disappear so soon as the

selling price of coal declines ever so slightly. The burden of production will once again fall upon the large and stable companies. The production of these small mines, insignificant when considered individually, amounts in the aggregate to a respectable total, and, because of the practical cessation of extensions and development work at the larger mines during the war period, the big companies will not for some time be able to work up their production to a maximum, or anything like a maximum.

What does all this lead to? Inevitably, the writer believes to consolidations of the existing coal companies. In a Bulletin prepared for the Mines Department three years ago the writer expressed the opinion that "the chief hope of settled prosperity in the Nova Scotian coal trade lies in the further development of strong corporations with adequate financial reserves." The writer further remarked: "Whatever financial stability attaches to the coal companies of Nova Scotia is a testamentary benefit conferred by the General Mining Association; a monopoly that, with all its faults, yet rendered it possible to conceive mining operations on a comprehensive basis, eliminated suicidal competition in selling prices; and enabled mine workings to be laid out with the maximum of economy, with due regard to the conservation of the vast coal reserves which sporadic individual operations have tended to endanger by unco-ordinated effort."

These remarks are more pertinent today than when they were written.

PERSONAL.

Dr. W. G. Miller, Provincial Geologist of Ontario, has returned to Toronto after being in England for several months as Canada's representative on the Committee on Mineral Resources of the Empire.

Capt. W. M. Goodwin has returned to Canada, bringing with him a young lady from Scotland.

Nova Scotia members of the Canadian Mining Institute have nominated Mr. D. H. McDougall for the presidency of the Canadian Mining Institute. Members in the Porcupine gold district have nominated Mr. J. B. Tyrrell.

Mr. B. E. Neilly, of Cobalt, has been nominated for re-election as a vice-president of the Canadian Mining Institute. Among the nominations for council are: Mr. E. T. Corkill of Copper Cliff, Mr. Geo. Gillespie of Madock, Mr. Robt. Bryce and Mr. J. P. MacGregor of Toronto.

Prof. J. S. DeLury, of the University of Manitoba, is in Toronto for the holiday Prof. Debury is secretary of the Manitoba branch of the Canadian Mining Institute.

Mr. J. W. Powell, Mine Manager at Cassidy's Colliery, Granby Consolidated Mining & Smelting Company, has resigned and has been succeeded by Mr. James Hargreaves.

Mr. Hugh Sloan, Shift-Boss at Cassidy's Colliery, Granby Consolidated Mining & Smelting Co., died recently from pneumonia following an attack of Spanish influenza.

Mr. J. A. McRae, editor of the Mining Review, Cobalt, and a regular contributor to the Canadian Mining Journal, is just recovering from a severe attack of Spanish influenza.

Mr. D. C. McArthur, who played an important part in the development of the gypsum industry in Manitoba was present at the meeting of the Manitoba Branch of the Canadian Mining Institute in Winnipeg, Dec. 18th.

MANITOBA MINING MEN WANT FREEHOLD SYSTEM.

The Manitoba Branch of the Canadian Mining Institute held its first meeting of the winter in the St. Charles Hotel, Winnipeg, on the evening of December 19th. After an informal dinner and an interesting business meeting, the members and a number of guests listened to an interesting speech from J. A. Campbell, M.P., former Commissioner for Northern Manitoba, on "The Resources of Northern Manitoba." The talk was chiefly concerned with mineral resources, and the audience were plainly in accord with Mr. Campbell in his plea for provincial control of natural resources.

During the business meeting a resolution was presented by H. N. Baker, asking for a change from the leasehold system to the free-hold system, as applied to Quartz Mining Claims on Dominion Lands in the Province of Manitoba. On motion of T. B. A. Price, seconded by F. de Sieyes, after an interesting discussion, the meeting decided that the resolution be presented to the Canadian Mining Institute.

If the success and enthusiasm of a first meeting be taken as a gauge of the future activities of an organization, it can be safely predicted that the Manitoba Branch will have an important future, and will play an important part in the mineral development which we all know is coming in this misnamed "Prairie Province."

Among the guests present were: G. W. Allan, M.P.; R. L. Richardson, M.P.; Wm. Andrews, M.P.; and Hon. Edward Brown, of Winnipeg; Ferris Bolton, of Lisgar, and H. C. Carlisle, manager of the Mandy Mine on Schist Lake. Members from the districts of Rice Lake, Falcon Lake, Flin Flon and Herb Lake made the meeting representative of the whole Province. Among the members present from The Pas country were R. C. Wallace, President of the Local Branch; Walter Neal, manager of the Rex Gold Mine on Herb Lake, Bancroft; of the Mandy Mining Co., and Gordon, of Herb Lake. The Rice Lake District was represented by such old-timers as Hugh Smith, B. S. MacKenzie, Capt. Pelletier, and E. W. Jackson. From the Falcon Lake District came Capt. G. B. Hall, Frank Thoms, W. G. Chase (chief engineer of the Greater Winnipeg Water District), and L. Hicks. H. M. Paull, who with associates has recently made an important strike in the Knee Lake District, was also present.

Now that the influenza ban has been lifted in Manitoba, it is the intention of the Winnipeg Branch to continue their original program for monthly meetings throughout the winter.

RICH MOLYBDENITE ORE FROM TAYLOR MINE.

Returns just received by Mr. A. M. Taylor, who operates the Taylor molybdenite mine in Renfrew Co., Ont., show that the last car shipped averaged 5.3 per cent molybdenite. This car of ore was shipped some months ago to the Mines Branch laboratory at Ottawa. The ore was concentrated to 86.87 per cent MoS_2, the 68,644 lb. of ore yielding 3,852 lb. concentrates containing 3347.1 lb. MoS_2. The recovery was 92 per cent.

A car of molybdenite was shipped from the Hazelton View mine during the past winter and two tunnels are being driven, this development to continue during the next few months. The property is situated near Hazelton, B. C.

Interior Corrosion of Wire Ropes

Wm. Fleet Robertson's Report on Tests.

The inquest into the death of sixteen miners, which took place on the 10th of last September when the cable snapped in Protection Shaft, Canadian Western Fuel Company, still continues. The inquiry would have been completed had it not been for the delay entailed in sending Mr. Wm. Fleet Robertson, Provincial Mineralogist, to Montreal to make an exhaustive technical examination of the rope that broke and the postponement necessary because of the prevalence until recently of the influenza plague in Nanaimo city.

At the last sitting of the Coroner's Jury, which took place on the 16th of December, Mr. Robertson presented a report of the work he undertook at the laboratories of McGill University. He gave evidence which is of considerable general interest and of special importance to all identified, directly or indirectly, with the operation of mines in which wire ropes are in use. It is not improbable that, as a result, provision will be made for a more rigid inspection of such cables.

Dealing with the cause of the accident, as disclosed by technical researches, Mr. Robertson outlines his conclusions as follows:

"The failure of the cable was, in my opinion, entirely due to the oxidizing of the wires, chiefly internally, caused by apparent lack of any internal lubrication, leaving the wires exposed to the action of a more than normally corrosive water and a humid atmosphere.

"The internal hemp core, which under a sufficiently effective lubrication system, would serve as a reservoir of oil to keep the wires oiled and protected from corrosion, not being supplied with oil, became a reservoir of moisture and so hastened the corrosion of the wires.

"It is a well-known fact that if rust gets started in a steel structure, such rust will continue despite any surface application of anything that may exclude the atmosphere.

"Hence only a thorough soaking of the hemp core with oil before it is installed and a frequent renewal of the oil supply would be necessary to ward off corrosion.

"The fact that the tests showed the cable to be more corroded in certain parts than in others, and these not in any regular procession, may be accounted for by local conditions in the shaft of which I have no knowledge.

"The section of the cable about 4 or 5 ft. from the fracture, broke under a load of a little over 13 tons, and it stands to reason that the rope at the fracture had a lesser strength.

"The weight of the empty cage is given by the company as 4,357 pounds; the rope, 179 feet, weighed about 540 pounds; sixteen men at, an average of say 170 pounds, weigh 2,720 pounds. This makes a known dead load of 7,617 pound, or approximately 4 tons."

Mr. Robertson gives it as his understanding that the rope broke at a point which, at the time, was passing over the sheave and proceeds to say that "when a cable of this description passes over a ten-foot sheave, it is by the bending subjected to an additional 9,360 pounds or say roughly, 5 tons. This, in addition to the dead load as above, would give a strain in cable, if travelling slowly, of approximately 9 tons. This approaches so near to the breaking strain shown in Test 5 (described hereinafter) that it is scarcely necessary to assume extraordinary rough handling by the hoistman to account for the break.

As an indication that this sort of interior corrosion is not confined to the case in hand Mr. Robertson produced "a piece of 1¼ inch cable from a Sudbury mine which was tested at McGill University in my presence. It broke at 58,600 pounds, whereas the new cable had a breaking strength of about 128,000 pounds. I think you will agree with me that this cable shows but little deterioration discernible externally, whereas in the broken end, also exhibited, the internal corrosion is excessive."

Before proceeding to give details of the interesting experiments carried out at Montreal under Mr. Robertson's supervision it should be explained that he was furnished at Nanaimo with all the faulty cable which, for convenience, is divided into three parts, viz.: Exhibit 13: That part which was constantly on the hoisting drum in the engine-room. Exhibit 11: That 100 feet including the upper end of the fracture and extending upward. Exhibit 12: That 100 feet including the lower end of the fracture and extending downward to the cage. He also had the spiral springs designed to bring the safety clutches into action; a jar of water collected as it fell in Protection Shaft; and a bottle of black oil of similar character to that used in lubricating the cable. His directions were to submit these "exhibits" to "the most critical physical, chemical, and microscopic tests practicable in Montreal" with a view, of course, to establishing definitely and beyond cavil the cause of the break.

The results of the tests to which the cable was subjected are described in detail as follows:

Tests on Nanaimo Mine Rope.

Test 1: This piece of cable (that taken from the drum) showed only very slight wear and only on the outer wires, possibly caused by pressure on the drum. The individual wires were bright and free from rust. The cable was practically as good as new, and had been lubricated, grease oozing out as the strain was applied. The test piece taken was very approximately 36 inches between the grips. The load was applied in successive increments of 10,000 lbs. each, the elongation of the specimen being taken for each increment. The elongation for each 5 ton increment was 4/100 inches up to 70,000 lb. increasing gradually until at 120,000 lb. the elongation for the last increment was 8/100 in.—the total elongation under this load being 59/100 inch. At almost 130,000 lb. the elastic limit of cable seemed to be reached and the cable broke under a load of 160,000 lb., after sustaining such load for a minute or so, when 3 strands broke simultaneously a few inches below the upper grip. The pull being continued, the other three strands broke near the lower grip. The breaking strength of cable was 160,000 lb., or 80 short tons. As a check and confirmation of this test a 24" piece of cable adjoining the test piece was unwound—the individual wires somewhat straightened—and 6 of the larger wires and 3 of the smaller wires from each strand were submitted to a tensile breaking strain. These wires showed remarkable similarity in strength.

"The wires of average diameter of 0.1255 inclusive had average strength of 2540 lb.

"The wires of average diameter of 0.085 inclusive had average strength of 1165 lb.

"The aggregate strength of all the wires comprising the cable, if pulled straight, would be 179,100 lb. The strength of the cable, therefore, was about 89.35 per cent of the strength of the aggregate of the wires,

a result considered as indicating a well built cable. The tensile strength of the steel in the wires would be equivalent to about 208,000 lb. to the sq. in. This result taken with the uniformity in strength of wires indicates an excellent quality of steel in the cable.

Test 2: Sections of cable immediately above the fracture. The test piece from this was cut starting about 5 ft. above the tapered end of fractured cable. The exterior showed a certain amount of wear on the outer wires, but this was not at all serious. No broken or torn wire ends were observed on the surface in the whole length of the piece. A serious amount of rust was observable on surface wires. In opening up the end of the test piece in preparing it for the grip the small interior wires were found to be badly rusted and eaten away, so much so that several of them were found to be completely eaten through. None of the larger (0.1255 in diam.) outer wires were eaten through; but they also were badly corroded, a rough estimate being that the steel in these wires had about half the sectional area of similar wires in Exhibit 13 (the good rope). The cable and the core showed no indications of having been lubricated; both were dry and dusty. This test piece (tested similarly to the former) showed very even elongation for each successive increment in 5 tons in load, up to 60,000 lb. about which point the elastic limit seemed to be reached. Under a load of 81,900 lb. four strands of the rope broke, the break extending 12 in. below the grip. In breaking clouds of dust were given off, the doors of the building having to be opened to clear the air, indicating the interior to be very dry, with no indications of having been oiled. The two remaining strands broke under load of 21,000 lb.

Test 3: This and the following two tests are of three separate pieces of the rope from the fracture down towards the cage. The test under consideration was of a piece cut 11 feet from the end nearest to the cage. It was seemingly uninjured by its fall with the cage. It was not untwisted at all and there were no projecting or loose wires on the surface. The surface was somewhat worn and was corroted to at least half section of the externally visible wires. In the portion opened for the grip several of the small wires were found to be corroded completely through, as were a few of the larger wires. The load was applied as in previous tests. With each 10,000 lb. increment of load the elongation was practically constant up to 40,000 lbs., being about .07 in. for each increment. At about 40,000 lbs. certain of the interior wires were heard to break. At 49,400 lbs. the cable broke at about three inches below the upper grip. The centre core was absolutely dry and dusty, and large quantities of rust dust were given off on breaking.

Test 4: This test piece was cut 21 feet 6 inches below the fracture. The cable showed but slight wear but was much corroded both on surface and inter or wires, but as far as could be seen few if any of the wires were actually eaten through. No evidence of lubrication was visible in the interior of the cable. This piece was tested as were the former. The elongation for each 10,000 lb. increment was constant at about 5/100 inch up to 80,000 lb. which was about the elastic limit. Under a load of 106,000 lb. some of the interior wires were heard to break. At 109,800 lb. the cable broke, two strands parting about 6 inches below the upper grip. Subsequently the remaining strands were broken by re-application of the load. The third strand broke under load of 55,000 lb.; the fourth under load of 55,400 lb. and the fifth and sixth under load of 43,700 lb. Three strands broke near each end of the test piece.

Test 5: This piece was cut at 3 ft. below the point of break. It did not appear to be damaged by the fall. The rope was still tightly twisted and but slightly bent, not enough to materially affect it. This piece was badly corroded, so much so that even on the surface a number of the wires were seen to be completely eaten through and could be picked out with the fingers, but none of the ends projected. In the interior of the cable one of the sub-strands was completely cut through by erosion. There was no indication that the rope had ever seen oil. In opening up the two ends for the grip 32 wires were found completely erroded through and loose. The condition of the test piece was evidently so bad that the load was applied in smaller increments than in other tests. At 2,600 lb. load wires were heard to break in interior. The successive loads applied were 3,000 lb., 5,000, 7,000, and 10,000 (when elastic limit was reached) 20,000 and 25,000 lb. At 19,500 a number of wires were heard to break and at 22,000 more wires broke. At 26,700 lb. load three strands parted 12 in. below grip. The there remaining strands broke at 8,800 lb.

The cable in question had been in use for three years. It is described as being originally a first-class cable in every particular, well made and of excellent material, of Lang Lay's build and apparently up to specifications.

It is in the following paragraphs that Mr. Robertson deals with the very important point of the difficulties of adequate and satisfactory inspection under such circumstances as those under review:

"The amount of rust visible on the surface was serious and showed when the cable was dry; but, if the cable as it hung in the shaft was dirty, an inspection by passing the rope through the hand or against a stick, would fail to reveal the defect in the rope, and was useless in this case.

"In a shaft where the cable was subjected to heavy and constant work, the wear on the external wires would probably be so great as to wear certain strands through, thus producing projecting ends and these would be the first indications of deterioration of such a cable. The hand test might then be of value. But in the Protection Island Shaft the mechanical wear on the cable was slight, the failure being internal, hence not discernable by the method of inspection in vogue.

The spiral springs designed to bring the safety clutches into operation were of excellent quality, capable of a safe extension of about 30 per cent of their length and having a pulling power when so extended of about 1,250 pounds. It may be observed here that tests since made at the Canadian Western Fuel Company's yards, Nanaimo, have demonstrated that such springs and clutches do not give satisfaction on a descending cage, although brought into successful operation on an ascending cage suddenly released.

The oil used in lubrication is declared to have been of a character non-injurious to the steel. Of the water Mr. Robertson says: "There was no free acid in the water that would dissolve the steel, but the water was of such composition as to rust the steel more rapidly than pure water would, and would also be apt to wash off any external lubrication of cable faster than would pure water."

No verdict has as yet been rendered the Inquest having been adjourned until January 19th, 1919.

Notes of a Discovery of Rock Salt in Nova Scotia*

By L. HEBER COLE, Mines Branch, Ottawa.

A deposit of rock salt of considerable thickness is being opened up in the neighbourhood of Malagash, Cumberland Co., N.S. This is the first known discovery of rock salt in the Maritime Provinces, and the first in Canada to be discovered at a depth sufficiently shallow to enable it to be won economically by actual mining.

Discovery and History of Deposit.

In the fall and winter of 1916-17, a number of wells were drilled for water, by Mr. Peter Murray, on his farm on the Malagash road, about 7 miles northeast of Malagash Station. In each case salt water was encountered, at depths varying from 70 to 90 feet, and a sample of this brine was forwarded by Mr. Allan McKenzie, to the writer at the Mines Branch, Ottawa. It was found to be a saturated brine, its analysis being given in the following table, together with four analyses of brines from the Western Ontario salt district for comparison.

The overlying beds penetrated by the shaft are in a nearly horizontal position. They consist of clays, soft shales and gypsiferous muds.

The underlying saline beds dip to the west of south at an angle of about 25°, and have a strike of south 70° east.

The saline beds, as encountered in the shaft, show, in the upper 12 feet, considerable impurities in the form of mud, but whiter rock salt is now being excavated at the bottom of the shaft. The indications from a drill hole located on the site of the shaft are that the salt beds have a thickness, at this point, of nearly 50 feet.

The saline beds are found associated with beds of gypsum mapped by Fletcher as of lower Carboniferous age. These gypsum beds are seen exposed on the shore to the north of the shaft. To the south of the shaft there is a small unmapped outcrop of what ap-

TABLE I.
Analysis of Canadian Brines.

1,000 parts by weight contain:

	Malagash Brine, N.S.	Western Ontario Brine			
Sodium (Na)	99.50	96.270	101.728	96.368	100.997

Ferric Oxide (Fe_2O_3)	0.10	n.d.	n.d.	n.d.	n.d.
	259.54	250.819	265.001	252.983	262.336
Sp. Gravity at 15.5° C.	1.200	1.197	1.2045	1.178	1.198

In the summer of 1917, Mr. A. R. Chambers and Mr. Geo. McKay, of New Glasgow, took an interest in the operations, and drilled a series of holes, including a diamond drill hole, with the hope of proving the presence of a bed of rock salt, and, if successful, to obtain some idea of its extent. The results of the drillings proved rather unsatisfactory, no cores having been obtained. A prospect shaft was then commenced—June, 1918. In this shaft rock salt was encountered at a depth of 85 feet from the surface, and, when visited by the writer on October 10, 1918, it had penetrated to a depth of 17½ feetin in the salt formation.

Headframe at Magalash Salt Mine

pears to be New Glasgow conglomerate. The salt beds are on the south slope of an anticline, and little is so far known as to their lateral extent. To the west, about one mile from the shaft, there is a pronounced fault shown in the shore section, and this may cut off the western extension of the beds. To the east, about the same distance, the occurrence of a marsh, caused by the sea eroding the northerly lying and protecting sandstone barrier, may determine the eastern extension of the deposit. The evidence at hand, however, indicates the presence of a salt formation of considerable extent. On the basis of data obtained from the shaft, from surface indications, and from the drill holes, it is possible that the saline formation, measured at right angles to the dip, may have a thickness of 175 feet.

A general sample of the whiter rock salt was taken for analysis, with the following results: (Analyst, Mr. T. W. Hardy).

Dried at 110° C.

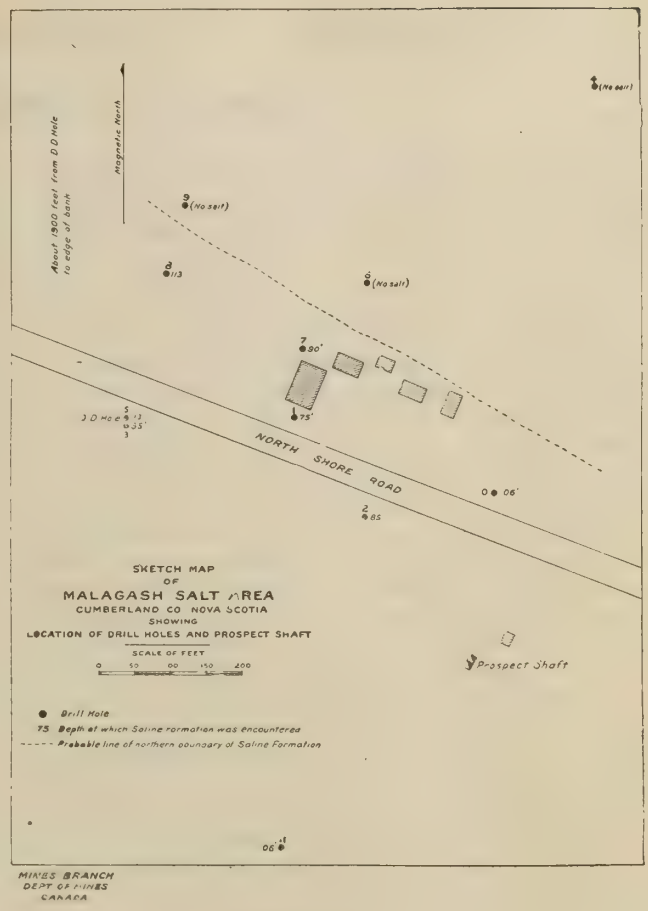
Sodium (Na)	38.45
Potassium (K)	0.20
Iron and aluminum (Fe and Al)	none
Calcium (Ca)	0.25
Magnesium (Mg)	trace
Sulphuric acid (SO_4)	0.61
Chlorine (Cl)	59.35
Insol. in water	1.05
Total	99.91

Conventional Combination.

Sodium chloride (NaCl)	97.60
Potassium chloride (KCl)	0.40
Magnesium chloride ($MgCl_2$)	trace
Calcium chloride ($CaCl_2$)	none
Calcium sulphate ($CaSO_4$)	0.86
Ferric oxide (Fe_2O_3)	none
Insol. in water	1.05
Total	99.91

Although the quantities of potash salts present in the two samples examined from this locality are small, it does not of necessity mean that they are absent in commercial quantities in this area. The drillings and prospecting so far carried out have only in the most superficial way indicated the presence of a large bed at one horizon, and the probability of encountering potash salts, interbedded with the sodium chloride at other horizons than the one penetrated by the prospect shaft and drill holes, is quite within the bounds of possibility.

First Blocks of Salt Mined at Malagash, N.S.



Malagash Salt Area

The importance of this discovery to the Maritime Provinces can readily be seen. The only salt producing district in Canada at present is the Western Ontario district. The Maritime Provinces consume about 50,000 tons of salt in the fishing industry each year. Owing to the prohibitive freight rates from western Canada, this salt has to be procured either from England, Spain or the West Indies. On the Atlantic seaboard of the United States, as well as in Newfoundland, a considerable tonnage of salt is imported for the curing of fish, etc.

It is evident, therefore, that the establishment in Nova Scotia of a modern salt manufacturing industry producing suitable grades of salt, would undoubtedly prove to be a profitable commercial enterprise.

Fire in the workings of the Princeton Colliery interfered with operations towards the end of November. It is now well under control, however, and work is proceeding.

One of the smaller powder houses of the plant of the Canadian Western Fuel Company, Nanaimo, B. C., was completely obliterated recently by an explosion, the cause of which is a mystery. Fortunately the accident happened when there were only a few men in the vicinity and no one was seriously injured. It is thought that some detonators were left in the building by mistake and that the explosion was the result of some of these falling to the cement floor.

German Methods of Destruction in the Mining Districts of France*

(Some very interesting articles have been lately published in the "Echo des Mines et de la Métallurgie" of Paris, on visits made by engineers to the liberated regions of France, where the British troops, and particularly the Canadians, have so distinguished themselves. —A short abstract of these articles, may be of interest to the readers of the Canadian Mining Journal.—It is to be noted that both Mr. Weiss and Mr. Defline, members of the Commission mentioned below, were official representatives of the French Department of Mines at the Geological Congress in 1913, and that both took active part in the discussions on the Coal Resources of the World, at the Toronto sessions of the Congress.)

"The town is a mass of ruins; the bricks themselves are reduced to dust. Mr. Basly, the mayor, was unable to identify with certainty the remains of the City Hall."

The Committee first of all visted Colliery No. 12 of the Société des Mines de Lens. The head-frame has collapsed, the mine is flooded, and the lining has been destroyed by blasting. Colliery No. 1, to the north-east of Lens is in the same state, the enormous tumbled down superstructure alone revealing the location of the shaft.—Approach to Colliery No. 13 is difficult and the shaft can only be reached by crawling through. the tangle of metal beams which represents the remains of the head-frame. The tubbing of this shaft is not destroyed. Neither is the lining of shaft No. 5, which is 300 metres deep, and in this colliery there is no more water than in any mine which has not been operated for some time. Of Colliery No. 15, at Lens, of which the head-frame was known as the "Tower Bridge" among the British troops, not a vestige remains.

"Under the most favourable conditions," says the official preliminary note of the Commission, "the hoisting of coal in small quantities from the pits, may be resumed in from 8 months to two years, but normal pre-war production cannot possibly be hoped for in less than five years."

At Courrières, where the "Compagnie des Mines de Houille de Courrières" had twenty shafts and 12,000 men, every single surface plant has been systematically destroyed with fiendish thoroughness. In both Lens and Courrières there is nothing that can be repaired; it is a case of clearing away the ruins and reconstructing entirely.—At Wingles, the iron and steel plant of the "Société Métallurgique de Pont-à-Vendin," comprising three blast furnaces, open-hearth steel plant, coke ovens, has been razed to the ground, the machinery having long previously been removed. These plants had just been completed at the cost of over forty million francs when war was declared, and operations were just starting.—From the testimony of liberated inhabitants most of these wanton destructions were effected at the time of evacuation of the German troops, when they were pushed back by the British army.

In the Anzin and Aniche districts the mines were working until the end of September, 1918, under German rule.—Owing to the hasty retreat there was less time available to destroy the shafts and underground workings, but all the machinery has been rendered useless, the favorite method having been to set off dynamite charges in steam chests, and cylinders, of hoisting engines, compressors, motors, and in general in all essential parts of machines and apparatus.

A few weeks ago a special commission, among the members of which were Mr. Basly, Mayor of Lens, Mr. Perrier, chairman of the Mines Committee of the French Chamber of Deputies, Mr. Weiss, Inspector -General of Mines, Mr. Defline, Director of the Service des Mines, and several mining engineers from Lens and Courrières, made a preliminary investigation of the state in which the German hordes left the French coal mines of the Lens-Courrières district on their retreat towards the Rhine.—Everywhere, scenes of desolation met their eyes. with a methodical ruthlessness the Huns, on withdrawing from this rich industrial and mining region had proceeded to systematically sack and thoroughly destroy all the plants. At Lens, of the 10,000 houses which constituted the town *not a single* one is now standing. In many of the cellars time-bombs had been placed, and during the first period of occupation of the town by the British troops, every ten minutes or so a violent detonation would take place, sending up heavy clouds of smoke and gas. The Royal Engineers, unfortunately at the cost of numerous comrades, have become experts at detecting the presence of these engines of destruction. They search for them diligently, and on discovering them, a warning signal to take cover is given, and a charge of high explosive is then set off to explode them prematurely.

"A large share of our thanks," says "L'Echo des Mines," must go to the members of the British Labor Corps, who do heroic work with characteristic imperturbability, frequently under enemy fire. After 24 hours of continuous work in Lens they had cleared the main streets sufficiently to render circulation possible."

*Abstracted from "L'Echo des Mines et de la Metallurgie," by Theo. C. Denis, Quebec.

OBITUARY.

William Lewis Phillips.

William Lewis Phillips, ex-President of District 18, U. M. W. of A., which includes the Eastern British Columbia and Alberta Coal Mining Camps, who left Fernie, B. C., with the 225th Overseas Battalion, C. E. F., has been reported killed in action on September 28th last. Thomas, a brother, was officially reported killed on September 29th, the day following. W. L. Phillips first came to Fernie from Wales seven years ago and was employed on the engineering staff at the Crowsnest Pass Collieries. After holding minor offices in the Fernie Union he was elected to the post of President of District No. 18 in 1914. After the expiration of that term he was re-elected, but resigned before the end of the year in order to take up arms with the Canadian forces. Two brothers, David E. and Richard S. are residents of Fernie.

The Voigt Claims, situated on Copper Mountain, near Princeton, B.C., are being closely inspected by representatives of the Consolidated Mining & Smelting Company of Canada, which recently acquired control of this property. Extensive development of this deposit of low grade copper is expected to commence early in the new year.

Special Correspondence

BRITISH COLUMBIA.

Loper Pardoned.

Mr. G. Weaver Loper, a mining broker who was charged with over-issuance of the stock of the Lucky Jim Zinc Mines, Ltd., and sentenced to ten years in the Washington State Penitentiary, has been granted a pardon by Governor Lister. Loper has suffered a stroke of paralysis, and his condition is said to be grave.

Labor Conditions at Anyox.

Mr. E. E. Campbell, Superintendent of the Anyox, B.C. Mine of the Granby Consolidated Mining & Smelting Co., and O. B. Smith, general superintendent of the company's mining operations, have returned to Anyox after visiting the Ketchikan district of Northern British Columbia. Mr. Campbell states that normal conditions have been attained again at Anyox after the set-back caused by the influenza. Labor now is comparatively plentiful, many loggers and other workmen, who had been employed in logging camps busy on war production, being available.

Predicts Great Future for Portland Canal District.

Mr. G. A. Clothier, British Columbia Provincial Resident Mining Engineer for the Northwestern District, recently reported to the Board of Trade of Prince Rupert that "taking everything into consideration I think the district at the head of Portland Canal is destined to become one of the most active and permanent mining areas in British Columbia." He urged that immediate steps be taken towards the construction of a dock and approach thereto.

Alaska Gatineau Now Working Two Shifts.

More men being available since the signing of the Armistice, the Thane mill of the Alaska Gatineau company has another shift at work, and shortly will have a third shift, running night and day. Both Manager George T. Jackson, of the Alaska Gatineau, and P. R. Bradley, of the Treadwell Properties, states that difficulty is being experienced in obtaining practical miners.

300,000 Tons and Concentrates Shipped to Trail Smelter.

Conditions relative to the operation of the Trail Smeltery of the Consolidated Mining and Smelting Co. of Canada, Trail, B.C., which were serious during November and for about a week in December, owing to the Spanish influenza epidemic, are improving. When the plague was at its heighth it was impossible to get ore cars unloaded, a large part of this work being done by contract. The immediate result was that for a time the company placed an embargo on ore shipments, having some 150 unloaded cars in the yards. The cost on demurrage alone was $500 a day, and it is estimated that the epidemic cost the smelter from $50,000 to $75,000.

Up to and including the first week in December over 300,000 tons of ore and concentrates have been shipped to the smelter of the Canadian Consolidated Co. at Trail, B.C. Three new shippers have appeared on the list this month (December) namely: Silver Hoard Mine, Ainsworth District, 21 tons; Grant Mine, Woodbury Creek, 4 tons; and Spokane Mine, Salmo, 20 tons. In the last weekly ore report of the Consolidated it is shown that the East Kootenay District has gone over the 100,000 ton mark in the year's shipments; that the Boundary District is over the 20,000 ton mark; that the Slocan District exceeds 30,000 tons; and that American mines have sent not quite 11,000 tons of ore to the Trail Smelter in 11 months.

More Activity in Placer Mining.

It is interesting to trace, by means of the records of applications for leases on the different placer grounds of British Columbia, the effect of the market demand and general conditions during the last several years. In 1915 values had not mounted to dizzy heights, and the labor problem was not very serious, with the result that the mining of the placer areas of the Province for their gold contents proceeded much as usual, about 160 leases being issued during the twelve months. The following year, however, found the quotations on metals of all kinds ascending, but gold remained stationary. This fact, together with the dearth of labor and the high costs, had its effect on the miners' interest in the placers of the Canadian West. The applications for leases dropped to 87. In 1917, although the same conditions obtained in regard to the price of gold and the problems of labor and of cost of operation continued, the insistent demand for platinum, which is found in many of the placer grounds of the Province with gold, and the high value at which it was quoted, namely $105 an ounce, once more fired the enthusiasm of prospectors and of operators. This is conclusively indicated by the issuance by the Provincial Department of Mines of 139 leases. The total for 1918, although the year is not quite at an end at the time of writing, will show that the interest was maintained as it will reach approximately 137 leases. Of the latter 35 bench leases and 9 dredging leases were granted during the months of October and November, which would seem to indicate that the predicted revival of gold production following the declaration of peace is being anticipated.

Ward-Hopp Litigation.

The latest phase of the long-drawn-out Ward-Hopp litigation was the Sheriff's sale in November at Prince George, B.C., of Mining Leases Nos. 1488 and 1494 under order of a writ of the Supreme Court of British Columbia. The said leases were those staked by John Hopp in 1913 and comprise the hydraulic mine at Bullion, B.C., formerly operated under the management of the late John B. Hobson.

The original company expended a large sum of money in development and working and washed out $1,300,000, which was a long way under the expenditure. The property was then sold to the Guggenheims, who began an elaborate development scheme, which came to an abrupt end in the panic of 1907. In May, 1913, Hopp staked the ground, which was granted to him finally under Leases 1488 to 1494. In October, 1913, R. T. Ward bought the Guggenheim rights, his contention being that the terms of the special act of the British Columbia legislature granted to the original company and acquired by the Guggenheims made the acquiring of a Free Miner's Certificate in order to hold the ground necessary.

In the resultant legislation Hopp was sustained by the Supreme Court of British Columbia but Ward, appealing to the Supreme Court, won. Hopp since has appealed to the Privy Council, where the case rests.

The purpose of the sale in question was to force court costs on Hopp and resulted in the bidding in of the leases to Mr. John A. Whittier, of Vancouver, for $325.

South Eastern Mines Co.

A. S. Holmes, manager of the South Eastern Mines Co., of Skidegate, Queen Charlotte Islands, B.C., states that preparations are being made for the further development of this gold bearing property and that it is expected that work will have made sufficient progress to make possible regular shipments at an early date. The ore carries free gold and some silver, lead and copper values. A shaft has been sunk to a depth of 100 ft., and about 600 ft., of drifting and cross-cutting has been marked by encouraging developments. It is proposed to instal a cyanide mill to treat the mine product.

B. C. Fluorspar Deposits Will be Developed.

Although it is not many months since the Canadian Consolidated Mining & Smelting Co. acquired a promising British Columbia fluorspar property, it has made such progress in development, and has made practical tests in the manufacture of hydrofluosilicic acid with such satisfactory results, that it is proceeding to open up the mine on an extensive scale. By the beginning of January the company, which already has forwarded several carloads to New York and Philadelphia, hopes to be able to begin regular shipments at the rate of from 1,200 to 2,000 tons a month. To facilitate this, an aerial tramway is being constructed for a distance of several miles from the mine to the railway. Thus the local requirements, which before had to be provided for by shipments from Kentucky, will be cared for, and there will be sufficient surplus to permit the export of considerable quantities.

Was Poor Coal Supplied Str. War Charger?

A short time ago the ss. "War Charger," after taking on coal in British Columbia for a voyage to the Orient, had to put back to port for the reason, according to statements given publicity, that she was unable to proceed on this fuel. On returning she loaded with Welsh coal. This reflection on the steaming quality of British Columbia coal is resented, it being maintained that it has been subjected to every test, practical and otherwise, with the best results and that it is so satisfactory that one of the Vancouver Island Collieries was able to enter into a contract to supply the Pacific Fleet of the United States Naval Forces. If the Str. "War Charger" was in trouble of the kind, which there is no disposition to deny, it is asserted that she must have been given an exceedingly poor quality of fuel and that the responsibility should be placed where it belongs and should be generally understood in the interests of the industry. The Board of Trade of Vancouver City has taken the matter up, its members pointing out that absence of a full explanation of the Charger's return is likely to leave the impression in England and elsewhere that a boat cannot be coaled in British Columbia to the satisfaction of the naval authorities. Some declare that the matter is of sufficient importance to warrant the fullest possible investigation by a civic commission.

The Greenwood Smelter May Be Operated By City.

That the Phoenix mines should be prospected by diamond drill with a view to demonstrating ore values in order to obtain the necessary supplies for the operation of the now idle Greenwood (B.C.) Smelter is a suggestion made by residents of the district. It is said that the Provincial Government is to be asked to extend financial aid to permit the starting of this work. Hon. J. D. MacLean, Provincial Secretary and the member for Greenwood, and Mr. J. E. Thompson, Member of Parliament for Grand Forks, B.C., are said to be in sympathy with the proposal and to be ready to render their support to any representations made along this line. Through Mr. Oscar Lachmund, former general manager of the Canada Copper Company, commercial interests of Greenwood City, determined that the smelter shall not remain inactive, have asked the last named company to lease the plant for $10,000 a year in order that the citizens' company may operate it. The Canada Copper Company directors at New York City are said to have these and other suggestions under consideration.

Ore Shipped From Blue Grouse Mine.

Two carloads of ore have been shipped from the Blue Grouse Mines, Cowichan District, Vancouver Island, to the Trail Smelter, and it is stated that shipments will be made regularly from now on. During the last few months considerable exploratory work, including drilling, has been in progress with satisfactory results, according to report.

Prince Rupert Wants a Smelter.

With the recrudescence of mining activity in the Portland Canal District, the City of Prince Rupert has commenced an agitation for the establishment of a smelter at that point. Commenting on this a mining man of Northern British Columbia says: "The one thing needed just now is a smelter near enough to the mines to enable the owners to ship at a profit. It is the one thing that will stimulate the mining industry. There are plenty of mines that could ship if it were not so expensive. Take as an instance, the American Boy mine. It was unable to ship on account of the cost, but when the Silver Standard put in a concentrating mill it was able to handle 25 tons a day from the American Boy, and the property at once changed from an idle prospect to a producing mine, which is paying well. Many other mine owners wanted to ship to the mill, but there was not sufficient capacity to enable it to take any custom work except from the one mine. There is no doubt about the desirability of establishing a smelter in the neighborhood, and Prince Rupert certainly is the logical point to enable shippers to avoid double handling. If it is built on tidewater and on the railway the mines from the interior can ship direct to it and the mines up and down the coast will have the benefit of cheap transportation. At Stewart, B.C., there will be important developments in the Spring. It is possible that Sir Donald Mann will build a smelter to handle the ore from his mines as well as that from others in the district."

Important development is in progress on the Galena Farm Mine near Silverton, B.C., an ore body 11 feet wide, having been reported to have been struck which contains two feet of galena.

Granby Finds More Good Ore.

A large deposit of a good grade of copper is reported to have been struck by the Granby Consolidated Mining & Smelting Company during the past season on the Ecstall River, which is a tributary of the Skeena River, into which it flows at the town of Port Essington, Northern British Columbia. Diamond drilling operations were carried out on the property which is an immense body of iron pyrites. It has been held for some twenty years by Victoria, B. C., interests and during that period some development was carried out, several tons of the pyrites being shipped to Victoria for the manufacture of sulphuric acid by the chemical works. The deposit consists of a mass of pyrite lying in schist formation, the belt being about a mile wide. The old work consisted of a crosscut tunnel a hundred feet in length and drifts twenty feet from it each way on the ore. While local officials of the company do not deny or confirm the report it is accepted by mining men as accurate and it is stated that the prospects are that the Ecstall Property may prove to be as big a thing as the Hidden Creek Mine which supplies the smelter at Anyox, B. C.

Grand Forks Smelter Again in Operation.

The Granby Consolidated Mining & Smelting Company's smelter at Grand Forks, B. C., which was closed down for a period because of lack of ore and coke, the result of the illness of many of the miners while the Spanish influenza epidemic was at its heighth in the West, has resumed operations. Three furnaces now are in blast and it is expected that there will be no further interruption, supplies being assured.

Developing Portland Canal Properties.

Following the report that the Big Missouri Claims, Portland Canal, B. C., have been acquired by Sir Donald Mann, who proposes their extensive and systematic development, comes information of other promising prospects in the same locality.

The Georgia Mining Co., the property of which is 18 miles from Stewart, B. C., has been worked all summer with good results. It is a free gold proposition and a mill is necessary to get the best results. It is near the coast and transportation facilities are provided by a good trail. Mr. C. H. Dickie, of Duncan, B. C., is the owner.

A new shoot of ore is reported to have been opened up at the Brown-Alaska Mine, also in the same district. Several thousand tons of ore were shipped from here some years ago. Work has been underway during the past few months and the new showing is said to consist of a couple of hundred feet of log grade copper. The possibility of installing a concentrator is being discussed. Mr. Martin Woldson, of Spokane, Wn., is the owner and Andrew Solstad has been in charge of development. The mine has closed for the winter but work is expected to be resumed early in the spring. Limestone has been obtained at Swamp Point, near Stewart, this summer by the Granby Consolidated Smelting Company for fluxing use at its Anyox Smelter.

Larger Output From Rossland Mines Expected.

Rossland (B. C.), one of the chief mining centres of the Province, which has been hard hit by the practical closing down of its larger mines controlled by the Consolidated Mining & Smelting Co. of Canada, is looking forward to better times. It is stated that the purely development work, which has been in progress during the past year, will lead to more than has been generally anticipated. Experiments are reported to have disclosed a new method of successfully treating, at a lower cost, the low grade ores of the camp at the Trail smelter. The output of the Rossland Mines is expected, as a result, to be increased from several hundred tons a day to between 1,000 and 1,500 tons per day.

B. C. Coal Output for November.

The coal output for British Columbia for November, 1918, shows a material decrease in comparison with the previous month, the difference being approximately 49,476 tons. This is explained by the fact that the Vancouver Island Collieries, in almost every instance, failed to do as well owing to the time lost by their employees, many of whom were off for periods of varying length owing to the epidemic of Spanish influenza. The production is placed at about 168,006 tons while that for October was 217,482.

Following are the detailed figures for the Vancouver Island Collieries:

	November.	October.
Western Fuel Co.	$ 49,121	$ 59,219
Canadian Collieries (D) Ltd. (Comox)	27,065	47,604
Canadian Collieries (D) Ltd. (Wellington-Extension)	17,216	26,762
Pacific Coast Coal Mines	2,914	5,773
B. C. Coal Mng. Co. (Jingle Pot)	3,257	3,025
Nanoose Collieries	1,112	1,990
Granby Consolidated Mng. & Smelting Co. (Cassidy's)	2,010	2,560
Totals	$102,695	$146,933

Nicola Valley.

	November.	October.
Middlesboro Collieries	$ 6,000	$ 8,202
Fleming Coal Mng. Co.	2,695	3,280
Coalmont Collieries	616	490
Princeton Collieries (Estimated	2,000	3,327
Totals	$11,311	$15,299

Crow's Nest Pass Field.
(Estimated.)

November, 54,000 tons; October, 55,250 tons.

The total output for the year 1918 up to the end of November, therefore, is about 2,372,161 tons, or an increase over 1917 of 222,186 tons.

Diamond drilling of coal property situated near the Sable River, Vancouver Island, is to be undertaken at an early date. A road now is being constructed up the river to permit the shipment of machinery to the prospect.

The annual convention of the Northwest Mining Association will be held in Spokane, Wn., from February 10th to the 16th, 1919. Special interest will attach to the discussions because of the return to peace conditions, and it is expected that, because of the importance of the problems, the Convention will attract a large and representative attendance of mining men from both the United States and Canada.

ELECTRIC HOISTS FOR MINES—Built the way you want them

The Electric Hoist in this illustration has the drum keyed fast to the shaft. It cannot turn in any direction except it is driven by the motor. There is no possibility of accidents through worn or loose frictions. The Hoist is under absolute control of the operator at all times.

This is only one of the many styles of Mine Hoists we make. Our Catalog shows many others. Have you a copy?

We make any of our Mine Hoists for either Steam, Electric, or Belt Drive, as desired. We make them with either one or two drums, and supply any diameter of drum up to 48 inches.

In any style Hoists we give you a choice of seven sizes, 10 H.P., 15 H.P., 20 H.P., 25 H.P., 32 H.P., 40 H.P., and 50 H.P.

MARSH ENGINEERING WORKS, LIMITED, Belleville, Ontario

Established 1846

Sales Agents, Mussens Limited, Montreal, Winnipeg, and Vancouver.

Drilling For Oil in Burnaby District.

A depth of 625 feet has been reached by the drill which is being sunk for oil in the Burnaby District near Vancouver, B. C., by the Spartan Oil company. The indications are said to be very promising and oil is expected to be struck at 1,000 feet. If the company is not successful in this instance it is the intenton to sink several more holes. The engineers advising the company remain confident that oil in commercial quantities exists in this section and, development having been undertaken, it is intended to carry it through until the belief of those who are interested in the enterprise is shown to be justified or demonstrated clearly to be without foundation.

Canada Copper.

After an inspection of the Copper Mountain plant of the Canada Copper company, George O. Bradley, of Messrs. Bradley, Bruff & Lebarthe, construction engineers of San Francisco, Cal., has returned to California. He reports that satisfactory progress is being made in the installation of the plant which will have a capacity of 2,000 tons and that the 100 miles power line of the West Kootenay Pawer & Light Company probably will be completed to the camp sometime in the summer.

Le Roi No. 2.

Mr. Ernest Levy, general manager of the Le Roi No. 2 Limited (Josie), Rossland, B. C., states that that mine produced, in the fiscal year ending September 30th last, 19,000 tons of ore. "Ore has been found in the old No. 1 Mine after many years of exploration," Mr. Levy said. "The body is 200 ft. long, two and a half to three feet wide, and has been followed up for 50 ft. The grade is of the average in gold, but below the average in copper. We are breaking and shipping ore from this body.

"Sinking has been resumed in a 200 ft. winze from the 1,650 ft. level. Ore extracted below the collar of the winze compares favorably with that extracted elsewhere in the mine, especially in copper, but in both copper and gold. Conditions in the winze are encouraging.

"Operations were resumed recently after an interruption of two weeks because of influenza and are proceeding with two shifts. As health conditions improve the force will be increased and development and production engaged in continuously.

"Considerable hardship has attended mining in the last year or so. It resulted from sickness, labor troubles, and high price of materials among other things. Powder is 100 per cent higher and steel 60 per cent. We use much powder and of a high grade, as the ground is hard. Steel has been hard to get."

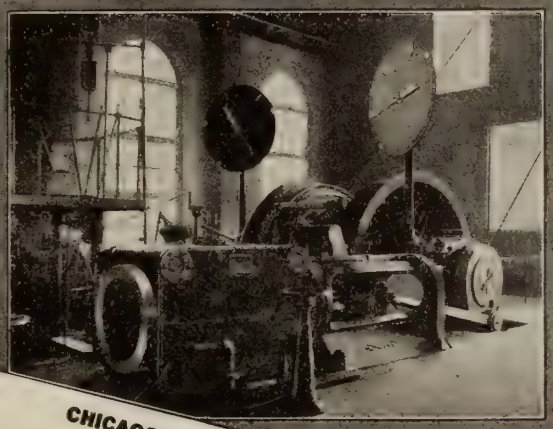
Trail Smelter.

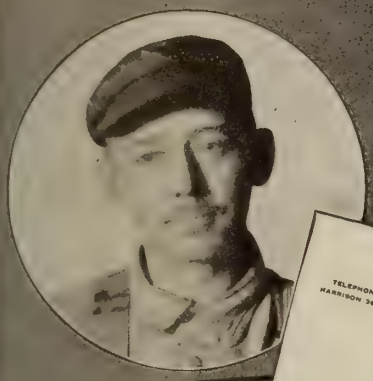
During the last week of November and the early part of December operations at the Consolidated Mining & Smelting Co's Smelter, Trail, B.C., were handicapped by scarcity of labor, many of the regular employees being laid up with influenza. Because of the epidemic the management asked shippers to cut down shipments of ore as far as possible temporarily.

New Hazelton Gold Cobalt Co.

Dalby B. Morkill, mine superintendent of the New Hazelton Gold Cobalt Company, a Vancouver corporation owning a group of claims on the Rocher de Boule Mountain, near Hazelton, B.C., expresses himself as satisfied with the results of development up to the present. Two tunnels are being driven and these will be continued. One of these is on the Victoria gold-cobalt molybdenum lead at a point 1,100 vertically below the apex of the vein, and 350 ft. below the main tunnel. This lower tunnel has now been driven 240 ft., 75 ft. being a crosscut to tap the vein and the remainder a drift along the vein. In this drift a shoot of ore 100 ft. long has been passed through, varying from two to three inches in width, which assayed, at the widest part, $109 in gold and 7 per cent cobalt. The face of the drift is now into a second shoot of ore. It was from the upper tunnel on the same lead, 750 ft. below the apex, that three carloads of ore were taken and shipped to Ottawa for treatment, the ore containing gold, cobalt and molybdenite. A 30-ton carload of ore from the same workings is now being loaded for shipment to the Granby company's smelter at Anyox. The purpose of the lower tunnel is to develop and block out the shoots of ore shown in the upper workings and to provide a lower and permanent entry to the mine. Driving on the vein will be continued during the winter and definite plans of operation made in the spring in accordance with the results of development. The other tunnel upon which work is being carried out is on one of the copper veins on the company's Moose claim, adjoining the Rocher de Boule mine. The vein is the extension, it is claimed, of that property's upper or main vein. The surface outcrop is not favorably situated for drifting upon, so a tunnel was started below the showing. It has been driven in loose ground a distance of 140 ft. and has just reached the solid formation

NORDBERG HOIST Breaks Worlds Record





HARRY EDGAR DURHAM
CHIEF ENGINEER

GEORGE W. SCHUMM
FIRST ENGINEER

TELEPHONE HARRISON 3650

CHICAGO, WILMINGTON & FRANKLIN COAL CO.
McCORMICK BUILDING
CHICAGO

November 14, 1918.

Mr. H. W. Dow, Sales Manager,
Nordberg Manufacturing Company,
Milwaukee, Wisconsin.

My dear Mr. Dow:-

Last December I wrote you regarding the performance of the 28" and 28" by 48" Nordberg hoisting engine at our Orient #1 Mine after the new cylindro-conical drum had been installed. From your interest at that time I think you would like to hear that our prediction of even better results has been realized.

Last week this Mine established a brand new hoisting record, Thursday recording the largest single day's output we have heard of for any coal mine and the week's average being higher than any single day's output for any other mine in the Southern Illinois field. The coal hoisted, prepared and loaded for shipment was -

Monday,	October 7th,	4928 tons
Tuesday,	" 8th,	5237 "
Wednesday,	" 9th,	5482 "
Thursday,	" 10th,	6008 "
Friday,	" 11th,	5355 "
Saturday,	" 12th,	5504 "
Total for week,		32,514 tons
Average per day		5,419 tons

The coal lies 520 feet below the surface, the hoisting distance from bottom of shaft to dumping point being about 600 feet. To raise the 6008 tons on Thursday it was necessary to make 1452 hoists or an average of 18½ hoists per hour, or better than 3 per minute - the pit cars averaging a little better than 4 tons of coal each. Single car, self-dumping cages.

This was remarkable hoisting, the output being very largely due to the fine action of the hoist itself which has greatly increased the capacity of this shaft.

With best regards,

Yours very truly,

President.

DIVIDENDS PAID BY NORTHERN ONTARIO SILVER AND GOLD MINES.

(The following tabulation is contributed by the "Northern Miner")

Dividends paid by gold and silver mining companies operating in the District of Temiskaming, Ont., in 1918, to December 31st, are as follows:

Cobalt	$3,623,513
Porcupine	1,771,544
Kirkland Lake	100,000
Total	$5,495,058

Total dividends paid from beginning of operations to December 31, 1918:

Cobalt	$76,398,171
Porcupine	12,819,089
Kirkland Lake	491,125
	$89,708,385

Dividends declared in 1918, payable in 1919:

Cobalt	$717,430

This will bring the total for Cobalt silver mining companies to $77,115,602, and the total for the District of Temiskaming to $90,425,816.

In comparison the dividend record in 1917 was:

Cobalt	$5,454,694
Porcupine	1,759,544
Kirkland Lake	65,187
	$8,279,426

Dividends Paid by Cobalt Silver Mining Companies to December 1, 1918.

Mining Company.	P.c. paid 1918.	Amount paid, 1918.	T'l P.c. Dec. 31, 1918.	Total Amount to Dec. 31, 1918.

Lake Shore	5	100,000	5	100,000
		$100,000		$491,125

That an embargo will be put on lead ore and concentrates shipments to the Trail Smeltery is the effect of a report now in circulation. The explanation given is that there must be a hiatus until settled peace conditions are established. It is suggested that such embargo likely will remain in effect all winter.

Ore Receipts at Trail Smelter.

There is now no doubt that the receipts of ore at the smelter of the Consolidated Mining & Smelting Co., at Trail, B.C., will be less than for either of the two previous years. For the first ten months of 1916 a total of 456,692 tons of ore was received. In 1917 the total was 327,639 tons and in 1918 it amounts to 292,454 tons. For the last six months or more of 1918 the gross ore receipts at the smelter have been around 20,000 tons per month, which is about half of what they were in the month of March, 1918.

The following table of gross ore receipts at the Trail Smelter for the first ten months of the three past years is interesting for comparative purposes:

	1916.	1917.	1918.
February	37,863	40,967	33,989
March	43,810	42,949	41,735
April	41,771	25,909	37,039
May	43,031	15,969	21,162
June	42,252	17,129	17,965
July	40,268	20,744	20,871
August	46,814	38,134	23,465
September	42,863	39,293	21,765
October	40,350	49,975	26,042
November	40,709	(strike)	21,027
Totals	456,692	327,639	292,454

EDITORIAL

$220,000,000 IN 1918.

The total value of the mineral production in Canada during 1918 was probably not less than $220,000,000. The total value of the production in 1917 was $189,646,821.

The Department of Mines estimates the production of coal during 1918 at about 15,180,000 short tons, as compared with a production of 14,046,759 short tons during 1917.

The production of the more important metals during 1918 is estimated as follows, viz.: Gold, $14,750,000 in value; silver, 20,800,000 ounces; copper, 117,000,000 pounds; nickel, 91,500,000 pounds; zinc, 36,000,000 pounds; pig iron, 1,182,000 short tons; steel ingots and costings, 1,010,000 short tons.

The production of these metals in 1917 was: Gold, $15,272,992 in value; silver 22,221,276 ounces; copper, 109,227,332 pounds; nickel, 82,330,280 pounds; zinc, 29,568,764 pounds; lead, 32,576,281 pounds; pig iron, 1,170,480 short tons; steel ingots and castings, 1,745,734 short tons.

NICKEL-COPPER MINING IN CANADA.
About 45,000 Tons Nickel and 13,000 Tons Copper, Valued in Matte at $36,000,000, from Sudbury District in 1918.

The year 1918 is one of unusual interest in the nickel-copper industry of Canada. The large production of nickel-copper matte was of itself a notable accomplishment, when the shortage of labor is considered. More remarkable than this, however, was the big advance towards making Canada the world's chief source of refined nickel, as well as of matte. The Port Colborne, Ontario, refinery began operations in July, 1918, and is now producing large quantities of nickel. Another refinery is in course of construction at Descrenes, Quebec.

During the first nine months of the year 1918, the smelters at Copper Cliff and Coniston treated 1,141,089 tons of ore, producing therefrom 64,926 tons of nickel-copper matte valued at $26,925,872 containing 33,688 tons of nickel and 17,232 tons of copper. Production for the year will be about 45,000 tons nickel and 13,000 tons copper. The value of the matte produced during the year will be about $36,000,000. As a considerable amount of this matte is now being treated at the refinery of the International Nickel Co. of Canada at Port Colborne, and added value will be given that will swell this total. During 1919 a much larger portion of the matte will be refined in Canada.

The new refinery, started in July, had produced at the end of September 358,205 lb. of nickel and 359,713 lb. of copper. This is much more nickel than had previously been produced, and is the first large production of refined copper. Until July, 1918, the refined nickel produced in Ontario was a by-product from the treatment of Cobalt silver ores, which contain silver, cobalt, nickel and arsenic. All the nickel-matte from the Sudbury district formerly went abroad, most of it to the United States and the remainder to Wales. It is hoped that from now on an ever-increasing proportion of the matte will be refined in Canada.

During the war we were handicapped by the lack of refining facilities. Fortunately it was found possible to prevent nickel from going to our enemies during the war; but we were not in a very strong position, owing to the necessity of exporting our matte in order to have it refined. We will not likely ever be in that position again.

At the mines and smelters the shortage of men has naturally necessitated that attention be specially given to maintaining output at as near capacity as possible. Nevertheless, improvements have been made during the war that will make more efficient operations in the years ahead. The Sudbury nickel-copper industry continues to grow and the operating companies can look forward to a long and prosperous life. Nickel and copper have, of course, been recently chiefly in demand for war purposes; but nickel and copper have a variety of uses that insure a big demand in peace times also. The cessation of war orders will necessitate more attention being given to markets; but we have no doubt that markets will be found.

ARE WE MAKING THE MOST OF OUR OPPORTUNITY?

Next to agriculture, mining is Canada's greatest basic industry. It is from the mines that we obtain our fuels, much of the material used in manufactures, and for building materials. Next to food, the mine products were the most necessary things used by our valiant soldiers in winning the war. Like food, mine products will be very necessary during the period of reconstruction. The Canadians who interest themselves in mining have good reason to believe that our mining industry will expand enormously if carefully handled during the coming years. They believe that rapid development of our mineral resources will help to make the Dominion prosperous. They know that Canada has natural resources

which place her in a very advantageous position now. They appreciate also that the mere having of these resources will not avail us much unless we proceed with development more rapidly than ever. Ore in the ground on undeveloped property is of comparatively little value. The benefits it can give come only with the expenditure of capital and labor. The sooner we can find the necessary money and men to develop our mineral resources the greater will be their value as a source of wealth to the country.

The Right Honourable Lloyd George, in proposing peace terms before the Trades and Labour Council of Great Britain, said: "Economical conditions at the end of the war will be in the highest degree difficult, owing to the diversion of human effort to warlike pursuits. There must follow a shortage of raw materials, which will increase the longer the war lasts, and it is inevitable that those countries which have control of raw materials will desire to help themselves and their friends first. Apart from this, whatever settlement is made, will be suitable only to the circumstances under which it is made, and as those circumstances change, changes in the settlement will be called for."

Alfred Ballin, organizer and administrator of the German shipping trust in a recent letter to Dr. Ratheman, of Berlin, remarked as follows: "You do not believe in the silly assertion that after the war these British markets for raw materials will be open to us? What a prospect! Out of the British Empire are produced countless articles on which we have hitherto relied and which will be indispensable in the future if we are to swim and not to sink."

We have the raw materials. We have the opinion of well informed men that the possession of these raw materials puts us in a peculiarly fortunate position. To derive the advantage which this position gives us it is essential that we proceed at once to use these materials. We do not conserve by neglect to use. We do not help to pay the interest on Government bonds when we leave potentially valuable ores in the ground. We should speed up development. We should recover more gold from the ground and put that gold to work; it yields no interest in the form of undeveloped ore.

Much progress has been made in developing our mineral resources in recent years. The value of our production of minerals for the year 1918 was about twenty times that of the year 1886. The value per capita last year was about ten times that of 1886. Nearly every year since 1886 there has been both an increase in value and per capita. Our production at the present is at the rate of about $200,000,000 annually. Much of this product of the mines is manufactured in Canada into a countless variety of useful things, thereby increasing in value by many millions of dollars.

We should, however, not be content with this record. We should awaken to the fact that we are proceeding too slowly. There is much good work being done by operators and by Government departments; but we need more workers and more encouragement for them.

A FAIR DAYS WORK FOR A FAIR DAYS PAY

Steps have been taken by the management of the Consolidated Mining & Smelting Co. to secure the cooperation of its officials and men at Trail, B.C., in meeting and tiding over the period of slackness which it is foreseen must be expected if the present unsatisfactory condition of the metal market continues. Two employees from each of the nine departments of the smelting and refining works were called into conference recently by the assistant manager, Mr. S. G. Blaylock. At this conference the future was frankly discussed, and it was pointed out by the management that it would be necessary for all identified with the industry to work together in the determination to maintain the highest degree of efficiency if the conditions likely to be encountered in the immediate future were to be satisfactorily overcome. Mr. Blaylock explained to the men that the company wished to continue in operation as long as the metal situation would permit. Parts of the plant might at times be temporarily idle but, with the maintenance of efficiency, other work would be found for the men, possibly along the line of construction. All he asked for was a fair day's work for a fair day's pay, and he would leave it to the conscience of each one to decide whether such was being rendered. Questions were asked by the men's representatives relative to the prospects, and answered as fully as the information available permitted. The discussion concluded with a complete understanding between management and the men, and it is confidently believed that the two will work together amicably and enthusiastically to the end that the difficulties expected may be tided over without recourse to any drastic measures.

PORT ARTHUR WANTS IRON AND STEEL WORKS.

The granting by the Dominion Government of 50 cents a ton bounty on all iron mined and smelted in Canada and the establishment, by authority and with the support of the Federal Administration, of a large blast furnace and steel plant at or near the city of Port Arthur, Lake Superior, are two important petitions to be laid before Premier Borden and his colleagues at an early date by the people of the district of Port Arthur.

Arguments for the granting of a bounty are enumerated as follows:

That during the last decade over 90 per cent of the product of the Canadian furnaces was from im-

ported ore, of which 58 per cent came from the United States Lake Superior mines and 41.9 per cent from the Newfoundland mines.

That the proportion of domestion iron ore smelted in Canada has gradually declined until in 1917 it was only 4.23 per cent.

That the iron ores of Canada are sufficiently known to warrant the statement that there is a large tonnage that could be made available for use by some preliminary treatment, if the increased cost of such treatment were compensated for by a bounty, as the ores of the Atikokam Range require roasting, Loon Lake ores hand sorting, Magpie siderite ores calcining, and Moose Mountain and Bathurst ores concentrating.

That extensive areas of promising iron formations have been located in many parts of Canada and it is reasonable to expect that the concentrations of merchantable ore will be found in these ranges when systematically exploited, especially on the Steep Rock, Mattewan, Kaministiquia, Nipigon, Little Long Lake and Michipicoten district.

That the granting of a bounty on iron ore would stimulate the prospecting of these areas, and probably secure the active operation of several mines already developed and equipped at a heavy expenditure in Northern Ontario and provide remunerative freight traffic to several sections of the Canadian Government railways that are at present apparently unproductive.

That the increased employment of mine operators, explorers and transportation employees, together with the general development of the iron mining districts, would so materially increase the customs receipts of Canada that the proposed bounty would be a very small tax (if any) on the finances of the Dominion.

Some of the points made in support of the plea for a Dominion Blast Furnace and Steel Plant are:

That practically all the steel plants in the Dominion are in Eastern Canada and have received $16,000,000 in bounties.

That between 1905 and 1915 Canada imported iron and steel products to the value of about $632,000,000.

That the population of Western Canada is now over 2,000,000 and in ten years has increased 174 per cent, whereas that of Eastern Canada has increased only 17 per cent.

That there are about 19,000 miles of railway in Western Canada radiating westward from the City of Port Arthur and manufacturing plants representing over $308,000,000.

That the United States Steel Company some years ago erected a large steel plant at Duluth at a cost of over $25,000,000 to supply the requirements of the Western States and is about to proceed with the erection of additional mills at a cost of approximately $15,000,000.

The policy recommended to the Dominion Government in the launching of the proposed industry is that the cost be placed at about $15,000,000 and that the interest for thirty years on eighty per cent of the actual capital invested be guaranteed or that the same guarantees be allowed as have been given to Canadian dry docks and shipbuilding plants to the extent of about $13,000,000.

VANCOUVER BOARD OF TRADE ASKS FOR ORE TESTING PLANT.

A petition that an ore testing plant be established in British Columbia, and that the drilling of the placer ground of the Tulameen River be continued will be presented to the Dominion Government by the mining Bureau of the Vancouver Board of Trade. The same organization proposes asking the Provincial Government for an explanation of its failure to diamond drill iron properties of the Province in order to arrive at an estimate of the available tonnage of magnetite and hematite ores.

With respect to the ore testing plant it is asserted that British Columbia operators are handicapped because they have to send sample shipments to Ottawa for treatment, a procedure which is both costly and slow. The type of plant required would cost only about $75,000, it is stated, and such an expenditure would be amply repaid in benefit to the mining men and the industry.

As to the Tulameen platinum operations it will be pointed out that during the past three months fourteen holes have been drilled and that the showings obtained fully warrant further prospecting. To discontinue the work now, it is argued, would be wasteful and unjustified. It has been demonstrated that this valuable mineral exists in the placer ground and the commercial possibilities of the resource should be determined before the work is abandoned.

It also was felt that no further time should be lost by the Provincial Government in taking action towards obtaining exact and authoritative information on the iron ore deposits of the Province.

P. B. Freeland, Resident Mining Engineer for the British Columbia Government, with headquarters at Grand Forks, B.C., who formerly was with the Granby Consolidated Mining & Smelting Co., was married recently at Vancouver, his bride being Miss Mary Bagley, of that city.

Mining Convention in Vancouver in March.

An International Mining Convention will be held in Vancouver (B.C.), sometime during the month of March, 1919. It had been proposed that this gathering should be called for January, but a postponement to the latter date has been agreed upon by the members of the Vancouver Chamber of Mines. The Convention has the endorsation of Hon. Wm. Sloan, Minister of Mines, and the Resident Mining Engineers of the various mining districts of the Province are expected to take an active part. The proceedings are likely to be of special importance, because of the problems which will come up for consideration.

Imperial Mineral Resources Bureau, London, Eng.

When the war came on the British Empire found that the enemy had more or less complete control of certain mineral industries of vital importance. Germany had been importing minerals and ores from various parts of the British Empire, refining them, and, in some cases, selling a part of the refined materials to the British. Early in the war it was found that while certain minerals and ores could be produced in quantity, facilities for refining them were either entirely lacking or were inadequate. It was decided that this state of things should not be allowed to continue, and great advances in metallurgy and the mineral industry generally, have been made in Britain during the war. The Scientific Products Exhibition held in King's College, Strand, August 12th to September 7th, 1918, and that of the Key Industries in Central Hall, Westminster, some weeks later, were illuminating as to the independence Britain now occupies.

Imperial Mineral Resources Bureau.

On the subject of the Empire's Mineral Resources, the Imperial War Conference, at its sittings in June and July, 1918, dealt with the following Memorandum prepared by the Minister of Reconstruction:—

1. In accordance with Resolution No. XIII of the Imperial War Conference, 1917, and following the report of a Special Committee presided over by Sir James Stevenson, steps have now been taken to establish the Imperial Mineral Resources Bureau.

2. In accordance with the recommendations for the constitution of the Governing Body contained in Sir James Stevenson's Report, the following representatives have been nominated on behalf of the Governments concerned:—

Chairman of the Governing Body (and Representative of the United Kingdom): Sir Richard Redmayne, K.C.B..
Canada: Dr. Willet G. Miller.
Commonwealth of Australia: Mr. W. S. Robinson.
New Zealand: Mr. Thomas Hutchinson Hamer.
Union of South Africa: The Right Hon. W. P. Schreiner, C.M.G.
Newfoundland: The Right Hon. Lord Morris, K.C.M.G.
India: Mr. R. D. Oldham, F.R.S.
Colonies and Protectorates: Mr. J. W. Evans, D.Sc., LL.B.

3. As regards the proposed representatives of mineral, mining, and metal industries, owing to the magnitude and complexity of the interests involved and the obvious desirability of having at the disposal of the Governing Body the best expert knowledge available, it is desired to increase the number of these representatives to six instead of the four originally recommended in Sir J. Stevenson's Report, to which the Dominion Governments have agreed. If this is accepted by the participating Governments it is proposed to nominate the following:—

Westgarth Forster Brown, Esq. (A leading consulting mining engineer, especially in regard to coal and coal mining; Mineral Adviser to His Majesty's Woods and Forests; Deputy Gaveller of the Forest of Dean, with experience in many Colonies.)

Professor H. C. H. Carpenter. (President of the Institute of Metals; Professor of Metallurgy in the Royal School of Mines.)

Dr. F. H. Hatch. (Ex-President of the Institution of Mining and Metallurgy; now advising the Ministry of Munitions on iron ore supplies. Has world-wide experience in metalliferous mining, and is a member of the Mineral Resources Advisory Committee of the Imperial Institute.)

Sir Lionel Phillips, Bart. (The well-known authority on South African mining; formerly President of the Chamber of Mines, now Comptroller of the Mineral Resources Development Department, Ministry of Munitions.)

Edgar Taylor, Esq. (Of Messrs. John Taylor and Sons; retiring President of the Institute of Mining and Metallurgy; an authority on gold mining.)

Wallace Thorneycroft, Esq. (President of the Institution of Mining Engineers; an authority on questions of iron mining and working.)

4. It is desirable to submit to the present Imperial War Conference proposals as to the position of the Bureau and its status in the machinery of Government.

The duties of the Bureau are thus defined in Resolution XIII, passed by the Imperial War Conference on the 23rd April, 1917:—

> "The Bureau should be charged with the duties of collection of information from the appropriate departments of the Governments concerned, and other sources, regarding the mineral resources and the metal requirements of the Empire, and of advising from time to time what action, if any, may appear desirable to enable such resources to be developed and made available to meet the metal requirements of the Empire."

This definition is expanded, as follows, by Sir James Stevenson's Committee:—

> "(a) To collect, co-ordinate, and disseminate information as to resources, production, treatment, consumption, and requirements of every mineral and metal of economic value.
> "(b) To ascertain the scope of the existing agencies, with a view ultimately to avoid any necessary overlapping that may prevail.
> "(c) To devise means whereby the existing agencies can, if necessary, be assisted and improved in the accomplishment of their respective tasks.
> "(d) To supplement those agencies, if necessary, in order to obtain any information not now collected which may be required for the purposes of the Bureau.
> "(e) To advise on the development of the mineral resources of the Empire or of particular parts thereof, in order that such resources may be made available for the purposes of Imperial defence or industry."

5. The constitution, as suggested by Sir James Stevenson's Committee, is as follows:

> "The administration of the Bureau should be controlled by a Governing Body representing the various parts of the Empire, as well as the mineral, mining, and metal industries. This body should be responsible for the appointment of a Director, or such other official or officials as may

be considered desirable, and the necessary subordinate staff, within the limits of the funds available for administrative expenses."

The Committee further suggested that the expenses of maintenance of the Bureau (being a sum not exceeding, for the first year of existence, £10,000 per annum) should, for the time being, be voted by the Imperial Parliament, on the advice of the Minister of Reconstruction, although the view was held by some of the Committee that from the outset direct contributions to the maintenance of the Bureau should be borne by all the Governments concerned.

6. It is proposed that the Bureau should be granted Incorporation by Royal Charter, which should define the constitution and the duties of the Bureau. The Governing Body will be established on the lines laid down by Sir J. Stevenson's Committee, with such alterations as may be approved by the Imperial War Conference.

7. As to expenditure, each Government would, of course, pay the expenses of its own representative. The normal expenditure of the Bureau would be met out of funds contributed by the Imperial Government, as suggested in the Report of Sir James Stevenson's Committee, together with such contributions from the Oversea Governments as they may, by agreement, be prepared to make.

This arrangement shall continue for three years, before the end of which time the question as to the contribution to be made by the Oversea Governments shall be brought up for discussion at an Imperial Conference.

8. Power should be given in the Charter to hold and deal with moneys which would be placed at the disposal of the Bureau by way of grants in aid contributed by the Imperial and Oversea Governments. Annual reports on the work of the Bureau shall be made to each of the Governments concerned.

Resolution XVI.

The resolution made was in the following terms:—

The Imperial War Conference, having considered the memorandum by the Minister of Reconstruction on the Imperial Mineral Resources Bureau, as amended, agrees that the number of representatives of the mineral, mining, and metal industries on the Governing Body of the Bureau should be increased from four (as originally agreed) to six. The Conference further approves the proposal for a Charter of Incorporation as set out in paragraph 6 of the memorandum and the proposals in paragraphs 7 and 8 as to the allocation of expenditure.

In accordance with the recommendation of the Conference the organization of the Bureau has been proceeded with and a charter applied for. Meetings of the Board of Governors, whose names are given above, have been held periodically, and committees on organization, finance, etc., have been at work. Thus far the meetings have been held in the Ministry of Reconstruction, but it is hoped that the Bureau will soon have a home of its own, probably in the vicinity of the Strand or Kingsway. It is already evident that there is much important work waiting to be undertaken by the Bureau which can be of great service to the Empire.

Mr. A. L. Larsen, until recently draftsman for the Consolidated Mining & Smelting Co., at Trail, B. C., is leaving for San Francisco, where he has been appointed to a position with a metallurgical concern.

COAL MINERS DID THEIR SHARE OF WAR WORK.

In discussing the contributions made by the different coal mining centres of British Columbia towards winning the war the labor paper of British Columbia, in a recent issue, gives figures and mentions many individual instances which indicate that the records of all these communities has been all that could be desired.

Introducing the article in question the editor says: "At the commencement of the war it will be remembered that the conditions in the mining industry, in common with many others, were somewhat parlous. Hundreds of long resident miners had already departed for other fields and many to other countries. In addition to these facts the call from Britain for industrial workers was readily responded to, and the commissioners enrolled men freely from the mining camps for this purpose. Many aliens have been introduced into British Columbia, and, particularly on the Island (Vancouver Island), the Asiatic miners have replaced the white by hundreds. Therefore any comparisons of number of enlistments to miners employed would be completely misleading unless these facts are also considered in connection with the very incomplete returns from the whole of the province."

Officials of District 18, U.M.W. of A., which includes Eastern British Columbia and Alberta coal fields, are mentioned as follows:

John Larson, of Lethbridge, a member of the district executive board when he enlisted, who was killed in action.

Jack Price, an active member of the local union of the district, and a candidate at one time for the office of President, who went to the front and made the supreme sacrifice for his country.

Clement Stubbs, a former president of District 18, who was granted a commission and served as a lieutenant. He was twice wounded, but has come through some of the most severe actions with his life. He is a brilliant orator, and his return is looked forward to by fellow workmen, it being anticipated that he will resume a leading place in the counsels and the activities of the labor movement of western Canada.

Then there was W. L. Phillips, another ex-president of District 18, who was killed while on service.

After mentioning specially many of the residents of the City of Fernie, who gave their lives, and printing a long list of the members of Gladstone Local Union No. 2314 who enlisted, some of whose names are numbered among casualties who never will be seen again and others of whom are expected back shortly, Tom Blairmore and "Old" Bill Archer are referred to. They went away with a Tunnelling Corps. Both were well-known and popular, besides being prominent in labor circles; "Bill" returned with rheumatism, only to be killed in one of the Blairmore Mines two days after he went back to work.

The coal miners of Michel, B.C., are credited with having sent one-third of their numbers to the war, the total being 98 men, while from South Wellington, Vancouver Island, there went over forty of the union members. No roll was kept of the number of enlistments from the Cumberland District, Canadian Collieries, Ltd., but it is estimated that at least 300 went overseas. The Nanaimo Mines contributed proportionately.

OPPORTUNITIES FOR PROSPECTORS IN THE COUNTRY TRAVERSED BY THE PACIFIC GREAT EASTERN RY.

In a report just issued by the Geological Survey Branch of the Department of Mines, Ottawa, Mr. Charles Camsell, director of the British Columbia Station, gives an interesting and instructive account of a reconnaisance of the country in British Columbia, through which the Pacific Great Eastern Ry. passes.

After pointing out that the principal mineral deposits of the province are associated with Jura-Triassic rocks he states that the most important occurrences of these rocks along the route of the railway are: The Birken Bank, extending from north of Anderson Lake to Birkenhead River; Pemberton Band, lying between Spetch and Pemberton; the Mons Band, extending from Green Lake to Cheakamus River; while smaller bands are found at Watson, Brew and Bethel. These localities, therefore, are of special interest to prospectors.

"These conditions," Mr. Camsell continues "are most favorable for the occurrence of metallic deposits of copper, lead, zinc, gold and silver, and the whole interior of the coast mountains of British Columbia, therefore, becomes an excellent field for prospecting, and not only the eastern and western borders as was formerly believed to be the case. Fortunately the magnificent system of deep fiords that cut deeply into the heart of the ranges makes it possible to prospect for these bands of stratified rocks and to easily develop any ore deposits that may be found in them. Prospectors, therefore, are urged to pay more attention to the coast mountains than they formerly did."

Referring to the deposit of limonite at Alta Lake, which is now being developed for the purpose of supplying a fluxing material for the Irondale Wn. Smelter, Mr. Camsell states that it covers an area of 60,000 sq. ft., with a length of 450 ft. and a width of 250 ft. Analysis is given of 40.98 to 48 per cent metallic iron; 0.2 per cent to 1.80 per cent sulphur; 0.1 to 1.88 per cent phosphorous; and 1.24 to 2.2 per cent silica. Other small deposits of similar ore occur in the neighbourhood, originating from the decomposition of pyrite bearing rocks.

An examination also was made by Mr. Camsell of the district adjacent to the headwaters of the Indian River, where several claims have been located east of the Britannia Mine ore zone. He considers most of the deposits of a character different from that of the Britannia. A band of stratified rocks a mile or more in width extends along the valleys of the Indian and Stamish Rivers. These rocks are surrounded by the granite batholith and intersected by numerous dykes.

On the Belle group are four outcrops of ore which are respectively four feet, seven feet, ten feet, and thirty feet in width, and from which samples are said to average 3 per cent copper. The Bullfondale group is located on an extension of the same ore zone as the Belle. The London group has a large iron-stained outcrop in granodiorite, through which the pyrite is abundantly disseminated with a little chalcopyrite and some molygdenite. The Roy group was purchased last spring by the Britannia Mining & Smelting Co. for $25,000 cash, and Mr. Camsell found on this group copper ore of high grade covering a surface area of 2,300 square feet. Bunches of pure chalcopyrite are common. Development consists of stripping and diamond drilling.

Mr. F. M. Bancroft, of the Geological Survey, makes a summary report on the Slocan District in which connection he refers to the Manganese Deposits near Kaslo, B.C., and points out that the primary silicate, rhodonite, occurs in Ainsworth, Yale and Kamloops mining divisions. A close search, it is suggested, should be made for ores of zinc and superficial ores of manganese in the vicinity of these deposits. The mineral occurs near Kaslo in a vein three feet to four feet wide, between graphic schist and chlorite schist and is due to hydrothermal solutions occurring along a contact fissure.

The secondary deposits of manganese near Kaslo are declared to be the most notable yet discovered in British Columbia, the grade being good and averaging 48.14 per cent manganese and 1.65 metallic iron.

With reference to the Lardeau Mining Division, Mr. Bancroft states that the surface indications in the Lardeau Valley and through the whole central mineral belt are good and merit more intelligent investigation for gold, while the mineralization compares favorably with that of Sheep Creek, Ymir, Nelson and Bridge River. There are silver-lead deposits at the head of Cascade, Poplar, Tenderfoot and Mobbs Creeks. Manganese, tin, platinum and nickel are to be regarded as minerals of possible importance in this district and it is pointed out that pyrrhotite from the Queen Victoria mine at Beasley, west of Nelson, carried 0.41 per cent nickel.

Lorne Mine, Cadwallader Creek.

One of the promising gold properties of the Cadwallader Creek District, Kamloops Mining Division, is the Lorne Mine. During the past year, owing to labor scarcity and the comparatively low value of gold, the work has been confined largely to development. From development there were milled about 380 tons of rock yielding 192 oz. gold and 37 oz. silver.

Pioneer Mine.

The Pioneer Mine is another gold property of Cadwallader Creek which has been operated steadily during the greater part of the past year. Milling was started on the 10th March last and ceased on the 21st of July following. The sinking of a shaft was continued from the latter date, and now is down 280 feet from the collar. Drifting has been carried on at the 280 foot level for 120 feet and good values are shown. Headgear, hoist house and blacksmith shop were destroyed by fire on November 17th, but milling is expected to recommence in a short time. Gold produced during the year up to the 16th November totals 1,925 ozs., and it is estimated that the output to the end of the year will aggregate 2,500 ozs.

Plant Installed at Ida May Mine.

At the Ida May Mine, also situated in the Cadwallader Creek District, a reduction plant consisting of a small jaw crusher, a Huntington Mill, with a capacity of 10 tons every 24 hours, and an amalgamating table were installed during the past year. Power is supplied by a 10 h.p. gasoline engine. In a trial run 30 oz. of gold was secured. The property now is closed down, but it is expected that it will be again operated in the spring.

Mr. F. H. Hawkins, who for several years past has held the position of Chief Assayer for the Standard-Silver Lead Mining Co. of Silverton, B.C., has gone to Anyox, B.C., to accept a situation with the Granby Consolidated Mining & Smelting Co. Mr. Thomas Brown will succeed Mr. Hawkins at the Silverton Assay Office.

Shell Company Would Explore Northern Alberta for Oil

A story comes from Ottawa, by way of Winnipeg, which has aroused considerable comment and even excitement in the Canadian west. It is to the effect that a British corporation, the Shell Transport and Trading Company, Limited, is to be given a blanket concession to enter upon and develop all the oil-bearing lands of Canada lying in the Province of Alberta and north of the Athabasca River. The company is to have a free swing for five years to investigate the geological conditions of this vast territory and develop the same. The concession is to be in the nature of a vast monopoly, except that the rights of prospectors and lease-holders already on the ground are to be respected. The company is to do the exploration and development work at its own expense. The oil thus produced is to be handled by the company, which agrees to pipe it to the head of the lakes or to Vancouver. The company is to have a return of six per cent upon its investment, and the remaining profits are to be divided on a fifty-fifty basis between the oil company and the Dominion Government.

The story is substantially set forth in a despatch from Ottawa to The Manitoba Free Press, the leading newspaper of western Canada and a staunch supporter of the Union government. The Free Press correspondent says that the initial negotiations were conducted last summer in England between the directors of the Shell Transport and Trading Company, Limited, on the one hand, and on the other hand by Sir Robert Borden, Hon. N. W. Rowell, Hon. Arthur Meighen and Hon. J. A. Calder, representing the Dominion Government. No conclusion was thus arrived at, but the proposal is not said to be under consideration by the cabinet at Ottawa, and a devision is expected at an early date.

In justification of the proposed concession, it is stated that the vast oil-bearing lands of Alberta, are not being developed as they should be, and that the only oil company in Canada of sufficient financial strength to undertake their development is the Imperial Oil Company, a subsidiary of the Standard Oil Company of the United States. It is felt that the vast deposits of oil north of the Athabasca should be kept under British control and that if not developed by the Dominion Government as a national undertaking its development should be entrusted to a British corporation. The Shell Transport and Trading Company, Limited, has a capital of fifty million dollars and has large holdings in oil and concessions for the development of the same in Rumania, Egypt, Borneo, Sarawak and the United States.

The Ottawa correspondent of The Free Press evidently considers the proposed bargain to be a good thing, and in the course of his despatch says: "Under the present system of oil exploration in the Dominion private individuals may secure a lease on 1,900 acres. They have little in the nature of expert geological recommendations to go upon. Moreover, if they do strike oil the problem of refining it and bringing it to market is still to be faced. There would appear to be only one company in the Dominion capable of meeting that problem at the present time, namely, The Imperial Oil. But there are no indications that that company desires to embark upon Canadian oil exploitation in the west. The Shell Company undertakes, if oil is found, to establish refineries and to undertake the piping of the oil to the head of the lakes or to Vancouver. The proposal has but recently come before the cabinet. It is under consideration now and a decision one way or another may be expected at an early date."—Toronto World.

H. H. STEVENS URGES GOVERNMENT OWNERSHIP OF SMELTERS AND REFINERIES IN BRITISH COLUMBIA.

Government ownership of smelters and refineries is advocated by Mr. H. H. Stevens, member of the Canadian House of Commons for Vancouver, B.C. Discussing the possibility of the development of a large metal manufacture trade in the Pacific Northwest, Mr. Stevens said that it was a matter which he had taken up with the Dominion Government, and with experts retained by the government. "In my opinion," he said, "we must begin, in British Columbia, with copper, zinc and lead. The first two are essential to the manufacture of brass. There is not only the home market in Canada, but a huge trade to be developed in the Orient in all kinds of metal manufacture." The raw materials were to be obtained by the establishment by the Dominion Government from its own smelters and refineries on this coast. Concerning the ore supplies necessary, he stated:

"As the mineral resources and their administration are under control of the Province, the co-operation of the Provincial Government would be necessary. As a carollary to the establishment of a Dominion smelter and refinery it would be necessary for the Provincial Government to impose such restrictions on the export of ore as would tend to direct these supplies to the Dominion smelter and refinery. It goes without saying that the smelter would have to give terms equal to those of the present smelters on the coast.

"As everyone knows, all the big mines and smelters except those of Trail, B.C., are owned by the American 'Copper Ring.' And even Trail is in the hands of the 'Ring' when it comes to marketing its product.

"The effect of a smelter operated in Vancouver would be to break the monopoly of the American 'Ring' as far as the metals of this Province are concerned. The Government could carry its product until market conditions were favorable, which might not be possible with a privately owned concern.

"No doubt, too, the establishment of such a smelter would result in the development of many new mines up the coast, and the extension of those now opened up as a constant market for their ores would be provided.

"Australia, Japan, China and all the other trans-Pacific countries use large quantities of manufactured metals, purchased largely in the United States. Our own raw metals go into those manufactures and American manufacturers derive the trade and the profit.

"The question of a smelter is now before the Government, backed by all the members from British Columbia and it will likely be brought up in the House of Commons during the coming session."

The Mining Convention, which was to have been held in Vancouver, B.C., under the auspices of the Vancouver Chamber of Mines during the first week in January, 1919, has been postponed indefinitely.

Rossiter W. Raymond

Secretary Emeritus, American Institute of Mining Engineers.

Dr. Raymond, to whom the term dean of mining engineers was fitly applied, passed away at his home in Brooklyn, N.Y., on Tuesday, December 31st. While the American Institute of Mining Engineers, with its world-wide membership, will always remain a monument to his genius, he was no narrow specialist. He was not only a great mining engineer, especially in the services rendered by him to the jurisprudence of mining, but was one of the greatest authors and one of the most eloquent speakers of his or any other generation in the technical world. At the dinner given by his friends in commemoration of his seventieth birthday, in New York, in 1910, Dr. Raymond's activities were epitomized by his pastor, the Rev. Dr. Lyman Abbott, of Plymouth Church, the successor of the great Beecher, as those of "sailor, soldier, engineer, writer, author, teacher, biblical critic."

Dr. Raymond was born in 1840, and when 18 years of age he set sail for Europe as a student. He became a recognized mariner before landing . . . .

"The good old Black Ball liner 'Great Western,' on which I embarked as a passenger in 1858, and became the third mate before the long, disastrous voyage was over, and the crippled vessel, with half a rig and half a crew, and on half allowance of water, crawled down the Irish Channel to reach Liverpool, and surprise the underwriters.

"After that initial unforeseen experience, I was brought by sea and land into contact with many peoples and many literatures, in scenes of peace and scenes of war; and I can now see that I unconsciously obeyed the maxim of Browning,

'Get thy tools ready,
God will find thee work.'

So that, when my work came to me, I was, without my own prevision or predecision, prepared to understand it, to love it, and, up to the measure of my strength, to do it."

From 1861 to 1864, Dr. Raymond served in the Union army in the great civil conflict.

A well known poem by Dr. Raymond is entitled The Grand Canyon, "the first line of which declares the great truth that the thoughts of God are on earth expressed."

As an author and critic, outside the domain of mining, it has been said, "Dr. Raymond has written excellent stories and his commentary on the Book of Job is a fine piece of biblical criticism."

Many writers, with more facile pens than ours, will describe Dr. Raymond's accomplishments and his achievements. We cannot do better for Canadian readers than to give quotations from speeches made by him in this country. They are messages to us which apply as well to-day as when they were delivered. Furthermore they illustrate Dr. Raymond's style as a speaker and a writer and his breadth of view.

During the last twenty-five years, under direction of Dr. Raymond as secretary, the American Institute of Mining Engineers has honored Canada by holding four meetings in this country. The term American, in so far as the Institute is concerned, as Dr. Raymond was fond of emphasizing, means North American, and does not apply merely to the territory south of the Great Lakes. The Institute has always had an active membership in Canada and this country has almost always been represented on its Council or Board of Directors.

In 1893, the Institute met in Montreal, with excursions in the adjacent parts of Quebec. In 1900 Quebec and Nova Scotia were visited. The British Columbia meeting of 1905 included an excursion to the Yukon. The mining men of Ontario had the pleasure of acting as hosts in 1907, the sessions being held in Toronto, with excursions to Northern Ontario.

At the meeting in 1900 the reverend Dr. James Douglas was President of the Institute. The following is from a speech at Sydney during that meeting by Dr. Raymond, with which most of us will agree as to the great benefits, other than technical, that are derived from membership in such societies as the A.I.M.E.

"I have been connected with the American Institute since 1871; it then had thirteen members, but it now has three thousand. If you come to any meeting of that Society and think that by sitting down in a hall and hearing some papers read you have struck the heart of that society you make a huge mistake. It is on the train, in the wagon, at the hotel over the evening pipe—I am afraid sometimes it is over the evening hot Scotch—that you will find the real work of that Institute going on. We learn more in our interchange of reciprocal feelings, we teach more in our talks, in our clasping of hands, in our social intercourse, than we do on the printed page . . . . It is not a question of piling up statistics as a permanent record, but it is a question of welding these people who do things into a social, harmonious and organized institution. Our institution was the first on this continent to do that on a large scale, and these societies of ours have welded together a great profession and made it a great factor for happiness and prosperity and knowledge among men. That is why I like to hold meetings anywhere."

At the Toronto meeting a reception was given by the Government in the parliament buildings to the members of the Institute and their guests. Adjournment was made to the legislative chamber, where several addresses were delivered. A part of Dr. Raymond's speech on that occasion may be quoted:

"I have spoken a good many times on Canadian soil. Some of you remember that in Vancouver, two years ago, I paid a hearty tribute to the achievements of Canadian engineers; and some may recall my address on the same subject, made in 1889, at Ottawa, in the presence of that great man—great man, I say, whatever party judges him!—Sir John Macdonald. I could only repeat to-night what I have said before, but with added emphasis. Years ago, I supposed that the conquest of this continent had been completed. I remember being very eloquent, somewhere or other, about the way in which the American mining engineer went on into the wilderness; and how Nature, which had lain for thousands of years in sleep and solitude and silence, like the Beauty in the fairy tale, woke at his coming, and rose, and smiled and gave herself to him, with all the glory of her beauty, and all the bounty of her treasure. Oh, I was very eloquent about that! I thought it had all been done; and that we had done it—we Americans; and I told the

young men of my generation that they might yet achieve great things, but not so great as the achievement of their fathers; that they might live to see wonderful epochs in human history, but there would be no future age like that, because there were no more worlds to conquer. The 'winning of the West' I thought we had completed. But lo! here was another empire in the North; and that world, too, our fair Canadian brethren are conquering. All hail to them! May they do better than we have done! But let them never forget that we and they follow a common purpose and share a common glory!

Among the numerous biographical notices of departed members of the Institute that Dr. Raymond wrote, quotations from one are especially appropriate at the present time. Many young men are now returning to Canada from the Great War, as did Dr. Raymond, and the subject of his sketch from the great strife nearly 55 years ago. Many of our young men have had their school and college courses interrupted, and will now find it hard to take up their work again. Will there not be encouragement for them in the life of one who, in the long ago, like them faced similar difficult conditions and triumphantly overcame them!

"Upon his discharge in 1865, he returned at once to his rural home and took up his life again, just where he had laid it aside. I had almost written 'laid it down'—and if I had done so, I could have defied the critic, and the proofreader, for he had as truly laid it down as if the sacrifice had been accepted and ratified by death. That the life thus freely offered was returned to him, did not impair the completeness of the sacrifice. His escape from the death he had dared was only a Voice which said, 'I have further use for thee!' So, at least, I understand it; and so, at least, did he! And I must add here, as a part of my picture of the man, that he never 'traveled' on his military record. He did not run for office on the strength of his army service, or urge it as a claim to civil distinction or preference. I think he regarded it as an episode, such as every good citizen should meet like a man—without bragging about it afterwards. I think he would as soon have paraded his honesty as his patriotism. Such things, in his view, 'go without saying,'

"So the crippled veteran of 23 went back to the Oxford Academy to prepare for college, with nothing to show in that line for the three years he had lost except when he had managed, in camp, to get out of his Latin grammar and reader, and, possibly, also a certain amount of fidelity, patience, and indomitable perseverence and courage, which had been both revealed and trained in the service of his country. And in 1867, as a man of 25 years, he modestly entered the Freshman class at Yale, along with a host of youngsters, who had not wasted any time in soldiering. Moreover, he did not cut short his college course on the ground that so much time had been lost, but went through the whole of it, shirking nothing, just as if it had been simply another campaign, and finally, in 1871, he took his degree as A.B. with his class."

. . . .

"At this point, I would pause again to call attention to the exceptional character of this example. Here is a man who has become 32 years old before entering upon his professional work. The delay has been due to intervals of three years and one year, sacrificed by the man himself, at the call of what he deemed higher duty—the first to patriotism, the second to presonal honor. But the original plan of the youth has been carried out, irrespective of these interruptions, without one iota of abridgement or change; and the man stands at 32 where he might have stood at 28, or even (if he had decided to ship his classical college-course, and plunge at once into his technical course) at 24.

"Yet, does he really stand only where he would have stood four or eight years earlier, if no time had been 'lost'? Is it nothing that a man, having been a soldier, knows how to be a comrade—to meet and understand and win to hearty co-operation other men? Is it nothing that, having gained through a classical education the ability to comprehend the lessons of history and the inherited associations which actuate, even unconsciously, the men of to-day, he is able to communicate convincingly to others what he knows himself? Is it nothing that he has shown himself to be a lover of his vocation, yet capable of sacrificing even his vocation to duty and honor? Finally, is his certified professional ability less likely to win professional employment and success, when backed by that other certificate, furnished by a wide experience with men and their enterprises? These, and other like questions are answered by the subsequent career."

The American Institute of Mining Engineers was founded in 1871. At the organization meeting at Wilkes-Barre, Dr. Raymond was elected temporary secretary. He was President in the period 1872-1874. In 1884 he was elected Secretary, a position he occupied till 1911, when he became Secretary Emeritus. During this period he saw the membership grow to over 6,500, at the end of 1917, with a corresponding increase in usefulness and influence.

Many honors were bestowed on Dr. Raymond by universities and technical institutions. Of these it will suffice to mention that he was an Honorary Member of the Iron and Steel Institute of Great Britain, of the Institute of Mining and Metallurgy and of the Societe des Ingenieurs Civils de France. — W. G. M.

DECLINE IN U. S. GOLD AND SILVER OUTPUT.

Washington, January 2.

Gold production in the United States in 1918 fell to 3,313,000 fine ounces, worth $68,493,000, the lowest in twenty years, and silver production dropped to 67,879,000 fine ounces, worth $67,879,000 at the standard Government price of $1 an ounce, the smallest record since 1913, according to the joint preliminary estimate of December of the Mint Baker and the Geological Survey, issued recently.

Return of normal conditions and falling of prices are expected to stimulate gold production in the United States this year, according to views of members of the Treasury's Committee appointed to suggest a remedy for the falling production of last year. Consequently it appears unlikely that the committee will recommend any unusual measures to stimulate production when it makes its report in a week or two.

Rapid mounting of the cost of mining is assigned as the cause of the decline, which is shown by comparison with the 1917 production of $83,750,000 worth of gold and 71,740,000 ounces of silver.

Metal Producers Expect Temporary Lull In Business

Victoria, B.C.

With the announcement, made a few days ago, that British Columbia copper ore shippers to the Tacoma Smelter will have to content themselves with a settlement hereafter on a basis of 11 cents a lb., mining men are speculating as to what is ahead of the industry. Producers here must receive at least 10 cents for blister copper on a 15 cent. market, or discontinue, as there must be allowance for transportation and treatment charges. That the Government price in the United States of 26 cents a lb. is purely nominal and that it is not likely to continue for long in any event, in view of the very large excess supply which the end of the war found on hand, is thoroughly appreciated by those interested. Consequently they are asking themselves what is to be done to right conditions. It is felt that the outlook is not very bright, as far as the immediate future is concerned, at any rate, but there is general confidence that, with the end of peace negotiations and the inauguration of a period of re-construction the demand for copper will become so brisk that the industry of the Province will find itself again with plenty of orders and continued activity assured. By the time this occurs British Columbia will be, or should be, in a position to very materially increase her output, which for 1918 will approximate 60,000,000 lb. The Canada Copper Company will be producing from the Copper Mountain property, and both the Consolidated Mining & Smelting Co., and the Granby Consolidated Mining & Smelting Company will have developed mainland and island properties to the point where they will take places among the large shippers of the copper properties of the Canadian west.

The position with respect to lead is another matter which is giving some concern, inasmuch as the price has fallen, according to information at the time of writing to 6¾ cents a lb. It will be recalled that the Consolidated Mining Company's management at the Trail Smeltery recently issued an order in which it was stated that, owing to the fact that a serious condition had arisen in the Canadian lead market, interest would be charged on money advanced to lead producers. In the course of the announcement reference was made to a large quantity of lead which is in the hands of the Imperial Munitions Board, and is "hanging over the market." This lead is in Canada, and it has been learned that the Imperial Munitions Board has arranged for its exportation, with the idea of relieving the embarrassment which its presence causes to the Canadian market. Mr. F. A. Starkey, of the Associated Boards of Trade of Eastern British Columbia, expresses himself as highly gratified with the latter development, saying: "The sum and substance of the whole thing is that we will now have a clean sheet to start off with. The action of the Board is timely. On December 9th, while in Spokane, I sent a wire to the Board pointing out that the dumping of the lead bought for munitions on the commercial market at this time would mean a glutting of the market. and that would be disastrous to the lead mining districts. But the difficulty is now settled." Mr. Starkey's wire to Sir Thomas White, Acting Premier, read: "During war shippers did not have benefit of Canadian duty, but sold Imperial Munitions Board at practically U. S. prices. Now that the war is over shippers expect that Canada will not be made a dumping ground for Mexican and U. S. surplus and scrap metal." Whether the action taken by the Board with reference to the stock referred to will have the effect which Mr. Starkey looks for is doubted by some who point out that Canada's biggest market is not local, and that the placing of munition lead elsewhere will have the result of reducing the demand for the Canadian production at least for a time, and that, at the best, the prospect is that there are a few dull months to meet.

Zinc at 7¾ cents a lb., with a comparatively inactive market as far as the output of British Columbia is concerned, is not very promising to the industry, but the Consolidated Mining & Smelting Company, it is felt, will be able to keep its refinery in operation by virtue of the bounty provided by the Dominion Government.

The future, however, looks much brighter for gold and silver properties. Gold producing mines are preparing to increase production, and it is confidently expected that in the coming months British Columbia resources in this respect will be largely developed, and those which are past that stage will be exploited to capacity.

The platinum placers of the Tulameen River are likely to receive attention at the hands of private companies, the operations of the Dominion Government in this locality having demonstrated the possibilities. The cessation of the war having affected the demand for molybdenite, chromite and manganese, it is not probable that there will be the active prospecting for these ores that has marked the past year or more. What will be done with the properties of this character located, and to some extent developed, remains to be seen.

The whole situation, to the minds of western operators, appears very complicated. To use their own words "the whole thing at present is mixed up, unsettled and unsatisfactory. We are in for a period of slack times evidently; but it is not likely to last more than for the period of peace negotiations. With an European settlement and the actual commencement of reconstruction there is no doubt that the demand for copper, lead, zinc and other ores will be revived and the industry will jump back as far and beyond the position which it gained during the war. Meanwhile, it is hard to say what is going to happen. We believe, however, that the smelters will be able to continue operations, possibly not on as large a scale, but sufficiently to tide over the hiatus."

RESTRICTIONS ON EXPORT OF BRITISH MANUFACTURES REMOVED.

Important cable dispatches have been received by Mr. G. T. Milne and Mr. F. W. Field, the British Trade Commissioners at Montreal and Toronto, respectively, from the Imperial Department of Overseas Trade in London pointing out that since the armistice was signed many restrictions on commerce have been withdrawn, while in the case of those which remain, licenses are being granted much more freely than previously. Particulars regarding these relaxations will be published weekly in the "Board of Trade Journal," the official organ of the Imperial Government for notices regarding trade.

Orders placed during the war period now have good prospects of being executed, and arrangements for

new business should be made without delay.

The following relaxations in particular should be noted:—

1. Permits to manufacture and Priority Certificates in connection therewith are no longer necessary.
2. Firms are at liberty to accept civil or commercial orders for immediate execution, thus freeing the engineering industry among others, for commercial work.
3. All the principal kinds of raw materials may now be used for the commercial manufacture of goods for export, but these raw materials themselves may not be exported in certain cases without licenses. Among those to which this condition applies are the following: Aluminum, antimony, brass, copper, iron, lead, nickel, spelter or zinc, steel and tin.

In general, restrictions on the export of manufactured goods have been removed, while they have been retained in the case of raw materials.

CONSOLIDATED MINING & SMELTING CO. OF CANADA.

An Active Year, but a Decrease in Profits.

An active and in some respects an expanding business, but one showing less profit than during the previous year, is revealed by the annual statement of the Consolidated Mining & Smelting Co. of Canada, which carries on large operations in British Columbia. The net profit for the year ending September 30 last was $867,259, compared with $1,076,828 in the previous year. This was after providing for $81,986 in taxes, writing off $408,557 for depreciation, and charging profit and loss account with $219,202 in development of properties during the past year. In 1917 $648,058 was written off for depreciation and $380,071 charged for development.

"Taking into consideration the recent improvements in metallurgical processes," says President W. D. Matthews, "and the enhanced value of the company's mining properties on that account, your directors decided to continue payment of dividends at the rate of 10 per cent per annum, charging to profit and loss account the deficit of $180,485. The balance at credit of profit and loss account now stands at $2,148,122." The balance at credit of profit and loss a year ago was $2,360,274. The season's metal product exceeded $10,500,000 compared with $13,000,000 in 1917.

"The continuous increase of the scale upon which the company has been operating for the purpose of meeting the copper, zinc and lead requirements of the Imperial Munitions Board," says Mr. Matthews, "and the development of new processes, especially those involved in the electrolytic treatment of complex zinc ores, have involved the expenditure of a large amount of money for new plant, but your directors hope that the result will be that the company will thereby be able to produce metals profitably at prices which may be expected to prevail under peace conditions. The cost of the new construction which was found necessary from time to time greatly exceeded the estimates by reason of the excessive and continually increasing costs of labor, materials and supplies of all kinds. Your directors, owing to these increased expenditures and to the interruption of operations during the first part of the year, have not been able to reduce the bank overdrafts as had been hoped and expected."

An issue of $3,000,000 in 7 per cent debenture bonds is planned. The power development of the West Kootenay Power & Light Co. will be extended and the copper refinery capacity increased from 20 tons to at least 50 tons per day. These capital expenditures will amount to at least $1,500,000. The company's assets are now placed at $17,099,923, compared with $16,994,568 last year.

Reports of company officials speak of the high cost of materials, delicate labor situation, and decision of the Imperial Munitions Board to pay but little if any more for lead requirements than these could be secured for from foreigners, though costs are higher in Canada. "At the same time," says Mr. James J. Warren, the Managing Director, "it must be realized that war activities have resulted in the establishment on a firm footing in Canada of industries engaged in the production of high-grade zinc and refined copper. The fabrication of these metals is bound to follow in due course."

FOUR ROPE HOISTING SYSTEM FOR NANAIMO COLLIERIES.

Experiments have been at progress at the collieries of the Canadian Western Fuel Company, Nanaimo, B. C., for the last two months in the effort to arrive at a solution of the problem of rendering impossible, or reduring the possibility to a minimum, a repetition of such an accident as that of last September when the rope used in Protection Island Shaft broke, causing considerable loss of life.

The ingenuity of Mr. Thomas Price, master mechanic for the company, has resulted in an arrangement which seems to come very close to meeting requirements. He has devised, and demonstrated its practicability in actual operation, a working model of a four rope hoisting system.

Mr. George Wilkinson, Chief Inspector of Mines, describes the arrangement as follows:

"There are four complete hoisting ropes, an overwind rope and an underwind rope on each compartment of the drum. Four pulley wheels are used, two of them being set some distance above the other two to avoid fouling of the ropes.

"The ropes on the two upper pulleys cross. A drum of the usual dimensions is used. Having an overwind and underwind rope on each compartment, the one rope is being unwound while the other is being wound.

"As the under rope is being wound on the drum and hoisting the cage, an overwound rope is being unwound and descending with the cage in the opposite compartment. The operation is the same on the other side of the drum. The whole operation is made feasible by simply crossing the two ropes that lead to the two upper pulleys."

Mr. Wilkinson asserts that this is one of the simplest and most practical arrangements he has seen on using safety ropes. He points out that everything is under control of the engineer, the same hoisting speeds being used on all ropes. Any possibility of slipping is avoided because all ropes are fastened to the drum.

Preparations are being made by the Western Fuel Company for the installation of this double rope system at their new mine, the Wakesiah, near Nanaimo, B. C.

The Canadian Honorary Advisory Council for Scientific and Industrial Research*

By DR. A. B. MACALLUM.

"Reconstruction and Development" in Canada in the new era of international girding for supremacy in the arts of peace means to the Canadian Honorary Advisory Council for Scientific and Industrial Research much in so far as "development" is concerned, but little in regard to "re-construction." Re-construction postulates the building up again of what existed before; and up to the outbreak of War there was constructed in Canada no national organization for research work. The glowing path of Canada's opportunity for industrial development runs wide and far, but the Council's research path has to be blazed through a comparatively unexplored forest. It is almost entirely new ground to be covered.

Where Germany and, though perhaps in lesser degree, the United States had builded before the war great organizations for industrial research founded on wide-visioned realization of the commercial value and necessity of applying science to industry, in Canada, as in Great Britain, state encouragement and individual enterprise had, until the war started, been content in the main with a laisser-faire policy. Germany had her trained technologists and research workers by the thousands in every field of industry, and, through the organized application of science to industry, was winning her trade victories in every foreign mart.

In the United States, which early took a leaf from Germany's book, the great Universities like Harvard, Yale, Chicago, Columbia and Cornell had staffs and equipments in pure and applied science, which kept pace or almost kept pace with the demand from great American industrial establishments for trained scientific investigators, chemists, electrical engineers, metallurgsts, etc. to solve industrial research problems. The annual budget of the Massachusetts' Institute of Technology, for instance, exceeded before the War, and still exceeds, the total of the annual expenditures of all the Faculties of Applied Science in Canada. There are some two thousand research laboratories in connection with large industrial concerns in the United States, and each of more than fifty individual firms expend annually sums ranging from $25,000 to $500,000 for research.

In Canada in a score of years less than twenty students have received the advanced (Ph.D.) degree in science from the University of Toronto and fewer still from McGill. Not two per cent. of Canadian firms have research laboratories and only about ten per cent. have routine laboratories, chiefly for the testing of materials. If Canadian industries were to seek for a supply of trained technical men capable of applying the most advanced scientific knowledge to industrial processes sufficient to meet even their most ordinary needs, the number of adequately trained men available would not be sufficient to satisfy five per cent. of the demand.

That, briefly put, is the situation with regard to the needs in Canada for equipment and men for research work. That is the situation that has confronted the Research Council since its creation in December, 1916. And that has been, and is, the crux of all problems of scientific and industrial research in Canada, handicapping the carrying out of the large research programme planned for the past year and for the coming year, jeopardizing Canada's position in the international rivalry for export trade and demanding prompt remedy if the full measure of our opportunity is to be grasped. In resources of capital and materials, in all the natural advantages for industrial supremacy we are in an enviable position as compared with our trade competitors. But in regard to the vital question of scientific organization of our industrial processes of finding new uses, hence new markets for the raw materials and the by-products of manufacture, and of keeping pace with the advances made in other countries through research, we have as yet hardly touched the fringe of opportunity.

Confronted with this situation and with a slowly awakening public and individual realization of its portent, the main task of the Council this past year has been, while carrying on the immediate needs of research work with the means at hand, to pave the way for meeting adequately the urgent needs of the future. The goal has been a supply of trained men for research work, adequate equipment and facilities for research and the enlistment of industrial organizations in co-operative effort to solve common problems, the solution of which lies in the application of science to industry.

A Central Research Institute.

The great forward step taken has been to promote the establishment of a Central Research Institute at Ottawa, combining the functions of the Bureau of Standards at Washington and of the Mellon Institute at Pittsburgh.

The proposal for such an Institute, submitted to the Government in November last, was the result of many months' careful investigation by the Council.

In view of the situation above outlined, the argument advanced in support of it is so obvious as to need no re-statement here. There has been a prompt and appreciative response to the proposal by the Government and by all the public interests concerned. There is good reason to believe that the Institute will be established without any unnecessary delay. It will involve an expenditure of $500,000 for a four-storey building, having initial provision for fifty laboratory rooms and with plans so drawn as to provide for expansion as the needs develop. The cost of the scientific equipment is estimated at $100,000, and the cost of maintenance, salaries, etc. at about $100,000 per annum for the first few years.

Trade Guilds.

The establishment of the Institute is the necessary first step towards placing industrial research work in Canada upon an adequate and permanent basis and towards enabling the Dominion to keep abreast of similar progressive methods in the United States, Great Britain, Japan, France, Australia and our other trade competitors. It will, doubtless, be followed by the or-

*Written for the Toronto Globe's annual financial survey issued on Jan. 2, 1919.

ganization of trade guilds or associations for research in each branch of industry, formed to pool resources in solving common problems and to take advantage of the laboratory equipment and opportunity offered, under the Council's proposals, by the Government-maintained Institute.

Training of Scientific Workers.

A further necessary step will be the working out of the Council's plans for more adequate provision by the Universities for the training of qualified scientific workers. In the more generous investment of state funds for this purpose, starting, say, with Toronto, McGill, and L'Ecole Polytechnique, lies the hope of securing for the ensuing years of the world's strenuous and pitiless trade warfare the nation's leaders in scientific and industrial research.

Research Problems Undertaken by Council.

Apart from these crucial phases of the work and aims of the Research Council, space permits only passing reference to some of the many research problems already undertaken.

$400,000 for demonstration plant.

As a result of the Council's initiative, Governmental action was taken in June last to secure federal cooperation with the governments of Saskatchewan and Manitoba in establishing a demonstration plant in the Souris coal areas of Southern Saskatchewan, to prove the commercial feasibility of carbonizing and briquetting the Western lignites for heating, in domestic furnaces. This year will see a plant established with an outlay of $400,000 and an annual output of 30,000 tons of coal equal to the Pennsylvania anthracite and marketed in Regina or Moosejaw at, at least, two dollars per ton less than the imported anthracite is now costing. The success of the initial plant, about which there can be little doubt, will lead eventually to the development of the immense and little realized latent lignite resources of Saskatchewan and Alberta, relieve for for Ontario and Quebec the present coal famine through limited American supply and save to Canada the five or six millions of dollars now annually going to the United States for coal for the prairie provinces.

Study of growth of trees.

A systematic study of the rate of reproduction and growth of Canadian forest trees of the commercial species has been undertaken through scientific survey of some eighty square miles of an old cut-over lumber district on the Petawawa Military Reserve. The data being secured will in the course of a few years give, for the first time, the essential definite information enabling the Dominion and Provincial Governments to inaugurate on a scientific and practical basis a scheme of re-forestation paralleling the best results obtained in the past in Europe. Our forest wealth, now in danger of exhaustion through reckless waste and disregard of adequate conservative systems, can only thus be preserved as a great and permanent national resource.

Tar fog research.

The tar fog research, initiated in 1917, has been continued with satisfactory practical results which will doubtless lead in the near future to the application to various plants in Canada of a new electrical process for the recovery of valuable by-products now lost in the destructive distillation of coal, wood, etc.

The research on sound measurements and fog signalling conducted in 1917 by Dr. Louis King of McGill has made further progress this year and forecasts a new type of sirens for use on the St. Lawrence River and Gulf.

Research work connected with the recovery of industrial alcohol from the enormous sulphite liquor waste of our Canadian pulp mills points to the installation of recovery plants and the production in Canada, at decreased costs to consumers, of the alcohol increasingly needed for industrial purposes and as a substitute for motor fuel.

There has been a score or more of other phases of industrial research initiated or continued during the year, each having a practical bearing on some branch of national production. More should and could be done, were trained men and money available. The Council's budget for the year has been under $100,000. In Great Britain, Parliament has recognized the need and the opportunity by creating a separate Department of Scientific and Industrial Research and has voted one million dollars per annum for five years to be expended by the Research Council. In Canada we, too, are learning the obvious lesson taught by Germany and already adopted by British industry. The path has been blazed for replacing rule of thumb methods in Canada by scientific investigation.

Special Correspondence

BRITISH COLUMBIA.

Will Install Plant at Meteor Mine.

The Meteor mine near Slocan City, B.C., has been bonded by Messrs. J. C. and W. A. Buchanan, the consideration given being about $45,000. It is a silver mine, but the ore carries also gold values. Twenty-two tons of the high grade ore was shipped to the Trail Smeltery recently. It is the intention to install a compressor in order to facilitate the carrying on of development work on a large scale. Mr. W. A. Buchanan will manage the mine

Aerial Tramway for Mountain Chief Mine.

Another gold-silver property of British Columbia to change hands recently is the Mountain Chief at Renata, which was bonded by J. W. Evans, of Revelstoke, B.C., the figure involved being understood to be $100,000. Mr. Evans plans to carry on operations in a more extensive manner than the previous owners, one of the first pieces of work to be undertaken being an aerial tramway from the mine to Arrow Lake. With this facility for transportation he figures on materially increasing the present output of 200 tons a month.

Cassiar Crown Strikes Good Ore.

The strike of a considerable body of copper ore of good grade is reported from the north of British Columbia, Hazelton District. The property on which this promising development has taken place is owned by the Cassiar Crown Copper Company. Although work has been maintained for several years past, nothing of special note was discovered, though there was sufficient ore of good quality shown to encourage the owners. Early in the past summer the company awarded a contract to run a short tunnel on the Ruby Claim, one of the group. A short time before the contract was completed the crew began breaking into ore, which widened with every round until, with the completion of the tunnel contract, they had exposed a vein fourteen feet in width with ten feet of clean ore.

Constructing Tipple at Diamond Vale Mine.

At the Diamond Vale Mine, Merritt, B.C., a tipple is being constructed in order to permit an early resumption of operations. The mine has been idle for some time.

We Make Any Type of Mine Car To Suit You and Your Work

We illustrate herewith one variety of our Rotary Steel Body Cars, to dump any direction. Very simple to operate and perfectly safe. The door is positively locked, and cannot discharge the contents of the car until unlocked and in dumping position.

Our catalogue shows many other types of Cars. Have you a copy?
Let us tender on your Cars, Cages, Buckets, and Hoists. We know we can please you as we have pleased so many others.

Marsh Engineering Works, Limited, Belleville, Ontario
Established 1846
Sales Agents: Mussens Limited, Montreal, Winnipeg, Vancouver

Powdered Fuel More Economical Than Oil?

It is reported that the use of powdered fuel by the B. C. Sugar Refinery, Vancouver, B.C., has proved satisfactory and that, as a result, the Powell River Pulp and Paper Company, and the Ocean Falls Plant of the Pacific Mills, Limited, are likely to adopt the same system. It is said that powdered fuel has been shown to be more economical than oil in this Province, and if the development suggested takes place, there will be established an important additional market for the output of the coal mines of Vancouver Island, Merritt and Princeton.

Delayed Settlements Cause Closing Down of Mine.

Supt. W. G. Norrie-Loewenthal, of the Silver-Standard Mine, in announcing the temporary closing down of his mine, says:

"Our reason for closing down the mine and the mill at this time is purely one of freight rates and the value of Silver Standard ore and concentrates. The railways, chiefly on the American side, where the zinc is shipped, have been altering their rates to such an extent that the smelter people are unable to make a settlement until the rates are adjusted. The matter has been up for two or three months, the Silver Standard people hoping all the time that the rates would be satisfactorily adjusted, and operations continued at the mine. As yet nothing has been accomplished, and it may take another two or three months.

"The position of the Silver Standard is very simple. They have not yet received a dollar for all the zinc concentrates sent to the smelter on the other side, and no chance of getting any until the rates are adjusted, either for what has been shipped or for what is on hand. To continue operations under the circumstances is out of the question.

"As for the mine itself it never was in better shape. There are several shoots of very fine high grade ore recently opened up. Work at both the mine and the mill has been running very satisfactorily. There are on hand a hundred tons of zinc concentrates and 72 tons of lead concentrates."

Mr. R. H. Stewart Will Adjust Taxes.

R. H. Stewart, M.E., of Vancouver, has been appointed by the Provincial Government for the purpose of adjusting the income tax to which the mining companies operating in British Columbia are subjected. He will review the companies' balance sheets from a technical point of view and it is expected that, with his mature experience of operating, he will be able to arrive at equitable settlements in every instance.

"ORTHACLASE" FELDSPAR—I have the finest grade of "Orthaclase" Feldspar and lots of it. Close to railway. Open for orders in any quantities. Car lots preferred.—P. J. DWYER, Wilberforce, Ont.

Mines Shipping Ore to Trail.

The two mines shipping the largest quantities of ore to the Consolidated Mining & Smelting Co's plant at Trail, B. C., during the past year up to the end of November were the War Eagle-Centre Star-Le Roi group at Rossland and the Sullivan mine, owned by the company. The former's total was 88,934 tons, the values being mainly in gold, and the latter's 88,836 tons, of which 82,742 tons supplied the zinc plant of the smelter. Other large shippers were the Emma Mine at Eholt, also owned by the company; the Josie Mine at Rossland with 17,114 tons, No. 1 Mine at Ainsworth, the largest shipper of silver-lead ore outside of the Sullivan with 5,782 tons, the Standard Silver Lead Mining Company at Silverton with 5,658 tons and the Bluebell at Ainsworth with 5,319 tons. There were some shippers from outside the Province among them being the Mandy Mine of Manitoba, which shipped 5,711 tons of high grade copper ore, the Electric Point in Washington which sent 4,563 tons of silver-lead ore, the San Poil at Republic which sent 2,615 tons of siliceous gold ore and the United Copper at Chewelah, which shipped 2,615 tons. Ore receipts at Trail from the various districts of British Columbia are as follows: Rossland, 107,457 tons; East Kootenay, 93,563 tons; Slocan and Ainsworth, 29,303 tons; Boundaty, 19,787 tons; Nelson, 4,246 tons; and American mines, 12,962 tons.

Conditions in Rossland.

Conditions are materially improving in Rossland, one of the most important of the mining centres of British Columbia. This is due to the resumption of operations on a large scale of the mines of the Consolidated Mining & Smelting Company. These are the largest gold producers of the province, their output under normal conditions being three-fifths of the gold produced by British Columbia.

EDITORIAL

$220,000,000 IN 1918.

The total value of the mineral production in Canada during 1918 was probably not less than $220,000,000. The total value of the production in 1917 was $189,646,821.

The Department of Mines estimates the production of coal during 1918 at about 15,180,000 short tons, as compared with a production of 14,046,759 short tons during 1917.

The production of the more important metals during 1918 is estimated as follows, viz.: Gold, $14,750,000 in value; silver, 20,800,000 ounces; copper, 117,000,000 pounds; nickel, 91,500,000 pounds; zinc, 36,000,000 pounds; pig iron, 1,182,000 short tons; steel ingots and costings, 1,010,000 short tons.

The production of these metals in 1917 was: Gold, $15,272,992 in value; silver 22,221,276 ounces; copper, 109,227,332 pounds; nickel, 82,330,280 pounds; zinc, 29,568,764 pounds; lead, 32,576,281 pounds; pig iron, 1,170,480 short tons; steel ingots and castings, 1,745,734 short tons.

NICKEL-COPPER MINING IN CANADA.
About 45,000 Tons Nickel and 13,000 Tons Copper, Valued in Matte at $36,000,000, from Sudbury District in 1918.

The year 1918 is one of unusual interest in the nickel-copper industry of Canada. The large production of nickel-copper matte was of itself a notable accomplishment, when the shortage of labor is considered. More remarkable than this, however, was the big advance towards making Canada the world's chief source of refined nickel, as well as of matte. The Port Colborne, Ontario, refinery began operations in July, 1918, and is now producing large quantities of nickel. Another refinery is in course of construction at Descrenes, Quebec.

During the first nine months of the year 1918, the smelters at Copper Cliff and Coniston treated 1,141,089 tons of ore, producing therefrom 64,926 tons of nickel-copper matte valued at $26,925,872 containing 33,688 tons of nickel and 17,232 tons of copper. Production for the year will be about 45,000 tons nickel and 13,000 tons copper. The value of the matte produced during the year will be about $36,000,000. As a considerable amount of this matte is now being treated at the refinery of the International Nickel Co. of Canada at Port Colborne, and added value will be given that will swell this total. During 1919 a much larger portion of the matte will be refined in Canada.

The new refinery, started in July, had produced at the end of September 358,205 lb. of nickel and 359,713 lb. of copper. This is much more nickel than had previously been produced, and is the first large production of refined copper. Until July, 1918, the refined nickel produced in Ontario was a by-product from the treatment of Cobalt silver ores, which contain silver, cobalt, nickel and arsenic. All the nickel-matte from the Sudbury district formerly went abroad, most of it to the United States and the remainder to Wales. It is hoped that from now on an ever-increasing proportion of the matte will be refined in Canada.

During the war we were handicapped by the lack of refining facilities. Fortunately it was found possible to prevent nickel from going to our enemies during the war; but we were not in a very strong position, owing to the necessity of exporting our matte in order to have it refined. We will not likely ever be in that position again.

At the mines and smelters the shortage of men has naturally necessitated that attention be specially given to maintaining output at as near capacity as possible. Nevertheless, improvements have been made during the war that will make more efficient operations in the years ahead. The Sudbury nickel-copper industry continues to grow and the operating companies can look forward to a long and prosperous life. Nickel and copper have, of course, been recently chiefly in demand for war purposes; but nickel and copper have a variety of uses that insure a big demand in peace times also. The cessation of war orders will necessitate more attention being given to markets; but we have no doubt that markets will be found.

ARE WE MAKING THE MOST OF OUR OPPORTUNITY?

Next to agriculture, mining is Canada's greatest basic industry. It is from the mines that we obtain our fuels, much of the material used in manufactures, and for building materials. Next to food, the mine products were the most necessary things used by our valiant soldiers in winning the war. Like food, mine products will be very necessary during the period of reconstruction. The Canadians who interest themselves in mining have good reason to believe that our mining industry will expand enormously if carefully handled during the coming years. They believe that rapid development of our mineral resources will help to make the Dominion prosperous. They know that Canada has natural resources

which place her in a very advantageous position now. They appreciate also that the mere having of these resources will not avail us much unless we proceed with development more rapidly than ever. Ore in the ground on undeveloped property is of comparatively little value. The benefits it can give come only with the expenditure of capital and labor. The sooner we can find the necessary money and men to develop our mineral resources the greater will be their value as a source of wealth to the country.

The Right Honourable Lloyd George, in proposing peace terms before the Trades and Labour Council of Great Britain, said: "Economical conditions at the end of the war will be in the highest degree difficult, owing to the diversion of human effort to warlike pursuits. There must follow a shortage of raw materials, which will increase the longer the war lasts, and it is inevitable that those countries which have control of raw materials will desire to help themselves and their friends first. Apart from this, whatever settlement is made, will be suitable only to the circumstances under which it is made, and as those circumstances change, changes in the settlement will be called for."

Alfred Ballin, organizer and administrator of the German shipping trust in a recent letter to Dr. Ratheman, of Berlin, remarked as follows: "You do not believe in the silly assertion that after the war these British markets for raw materials will be open to us? What a prospect! Out of the British Empire are produced countless articles on which we have hitherto relied and which will be indispensable in the future if we are to swim and not to sink."

We have the raw materials. We have the opinion of well informed men that the possession of these raw materials puts us in a peculiarly fortunate position. To derive the advantage which this position gives us it is essential that we proceed at once to use these materials. We do not conserve by neglect to use. We do not help to pay the interest on Government bonds when we leave potentially valuable ores in the ground. We should speed up development. We should recover more gold from the ground and put that gold to work; it yields no interest in the form of undeveloped ore.

Much progress has been made in developing our mineral resources in recent years. The value of our production of minerals for the year 1918 was about twenty times that of the year 1886. The value per capita last year was about ten times that of 1886. Nearly every year since 1886 there has been both an increase in value and per capita. Our production at the present is at the rate of about $200,000,000 annually. Much of this product of the mines is manufactured in Canada into a countless variety of useful things, thereby increasing in value by many millions of dollars.

We should, however, not be content with this record. We should awaken to the fact that we are proceeding too slowly. There is much good work being done by operators and by Government departments; but we need more workers and more encouragement for them.

A FAIR DAYS WORK FOR A FAIR DAYS PAY

Steps have been taken by the management of the Consolidated Mining & Smelting Co. to secure the cooperation of its officials and men at Trail, B.C., in meeting and tiding over the period of slackness which it is foreseen must be expected if the present unsatisfactory condition of the metal market continues. Two employees from each of the nine departments of the smelting and refining works were called into conference recently by the assistant manager, Mr. S. G. Blaylock. At this conference the future was frankly discussed, and it was pointed out by the management that it would be necessary for all identified with the industry to work together in the determination to maintain the highest degree of efficiency if the conditions likely to be encountered in the immediate future were to be satisfactorily overcome. Mr. Blaylock explained to the men that the company wished to continue in operation as long as the metal situation would permit. Parts of the plant might at times be temporarily idle but, with the maintenance of efficiency, other work would be found for the men, possibly along the line of construction. All he asked for was a fair day's work for a fair day's pay, and he would leave it to the conscience of each one to decide whether such was being rendered. Questions were asked by the men's representatives relative to the prospects, and answered as fully as the information available permitted. The discussion concluded with a complete understanding between management and the men, and it is confidently believed that the two will work together amicably and enthusiastically to the end that the difficulties expected may be tided over without recourse to any drastic measures.

PORT ARTHUR WANTS IRON AND STEEL WORKS.

The granting by the Dominion Government of 50 cents a ton bounty on all iron mined and smelted in Canada and the establishment, by authority and with the support of the Federal Administration, of a large blast furnace and steel plant at or near the city of Port Arthur, Lake Superior, are two important petitions to be laid before Premier Borden and his colleagues at an early date by the people of the district of Port Arthur.

Arguments for the granting of a bounty are enumerated as follows:

That during the last decade over 90 per cent of the product of the Canadian furnaces was from im-

ported ore, of which 58 per cent came from the United States Lake Superior mines and 41.9 per cent from the Newfoundland mines.

That the proportion of domestion iron ore smelted in Canada has gradually declined until in 1917 it was only 4.23 per cent.

That the iron ores of Canada are sufficiently known to warrant the statement that there is a large tonnage that could be made available for use by some preliminary treatment, if the increased cost of such treatment were compensated for by a bounty, as the ores of the Atikokam Range require roasting, Loon Lake ores hand sorting, Magpie siderite ores calcining, and Moose Mountain and Bathurst ores concentrating.

That extensive areas of promising iron formations have been located in many parts of Canada and it is reasonable to expect that the concentrations of merchantable ore will be found in these ranges when systematically exploited, especially on the Steep Rock, Mattewan, Kaministiquia, Nipigon, Little Long Lake and Michipicoten district.

That the granting of a bounty on iron ore would stimulate the prospecting of these areas, and probably secure the active operation of several mines already developed and equipped at a heavy expenditure in Northern Ontario and provide remunerative freight traffic to several sections of the Canadian Government railways that are at present apparently unproductive.

That the increased employment of mine operators, explorers and transportation employees, together with the general development of the iron mining districts, would so materially increase the customs receipts of Canada that the proposed bounty would be a very small tax (if any) on the finances of the Dominion.

Some of the points made in support of the plea for a Dominion Blast Furnace and Steel Plant are:

That practically all the steel plants in the Dominion are in Eastern Canada and have received $16,000,000 in bounties.

That between 1905 and 1915 Canada imported iron and steel products to the value of about $632,000,000.

That the population of Western Canada is now over 2,000,000 and in ten years has increased 174 per cent, whereas that of Eastern Canada has increased only 17 per cent.

That there are about 19,000 miles of railway in Western Canada radiating westward from the City of Port Arthur and manufacturing plants representing over $308,000,000.

That the United States Steel Company some years ago erected a large steel plant at Duluth at a cost of over $25,000,000 to supply the requirements of the Western States and is about to proceed with the erection of additional mills at a cost of approximately $15,000,000.

The policy recommended to the Dominion Government in the launching of the proposed industry is that the cost be placed at about $15,000,000 and that the interest for thirty years on eighty per cent of the actual capital invested be guaranteed or that the same guarantees be allowed as have been given to Canadian dry docks and shipbuilding plants to the extent of about $13,000,000.

VANCOUVER BOARD OF TRADE ASKS FOR ORE TESTING PLANT.

A petition that an ore testing plant be established in British Columbia, and that the drilling of the placer ground of the Tulameen River be continued will be presented to the Dominion Government by the mining Bureau of the Vancouver Board of Trade. The same organization proposes asking the Provincial Government for an explanation of its failure to diamond drill iron properties of the Province in order to arrive at an estimate of the available tonnage of magnetite and hematite ores.

With respect to the ore testing plant it is asserted that British Columbia operators are handicapped because they have to send sample shipments to Ottawa for treatment, a procedure which is both costly and slow. The type of plant required would cost only about $75,000, it is stated, and such an expenditure would be amply repaid in benefit to the mining men and the industry.

As to the Tulameen platinum operations it will be pointed out that during the past three months fourteen holes have been drilled and that the showings obtained fully warrant further prospecting. To discontinue the work now, it is argued, would be wasteful and unjustified. It has been demonstrated that this valuable mineral exists in the placer ground and the commercial possibilities of the resource should be determined before the work is abandoned.

It also was felt that no further time should be lost by the Provincial Government in taking action towards obtaining exact and authoritative information on the iron ore deposits of the Province.

P. B. Freeland, Resident Mining Engineer for the British Columbia Government, with headquarters at Grand Forks, B.C., who formerly was with the Granby Consolidated Mining & Smelting Co., was married recently at Vancouver, his bride being Miss Mary Bagley, of that city.

Mining Convention in Vancouver in March.

An International Mining Convention will be held in Vancouver (B.C.), sometime during the month of March, 1919. It had been proposed that this gathering should be called for January, but a postponement to the latter date has been agreed upon by the members of the Vancouver Chamber of Mines. The Convention has the endorsation of Hon. Wm. Sloan, Minister of Mines, and the Resident Mining Engineers of the various mining districts of the Province are expected to take an active part. The proceedings are likely to be of special importance, because of the problems which will come up for consideration.

Imperial Mineral Resources Bureau, London, Eng.

When the war came on the British Empire found that the enemy had more or less complete control of certain mineral industries of vital importance. Germany had been importing minerals and ores from various parts of the British Empire, refining them, and, in some cases, selling a part of the refined materials to the British. Early in the war it was found that while certain minerals and ores could be produced in quantity, facilities for refining them were either entirely lacking or were inadequate. It was decided that this state of things should not be allowed to continue, and great advances in metallurgy and the mineral industry generally, have been made in Britain during the war. The Scientific Products Exhibition held in King's College, Strand, August 12th to September 7th, 1918, and that of the Key Industries in Central Hall, Westminster, some weeks later, were illuminating as to the independence Britain now occupies.

Imperial Mineral Resources Bureau.

On the subject of the Empire's Mineral Resources, the Imperial War Conference, at its sittings in June and July, 1918, dealt with the following Memorandum prepared by the Minister of Reconstruction:—

1. In accordance with Resolution No. XIII of the Imperial War Conference, 1917, and following the report of a Special Committee presided over by Sir James Stevenson, steps have now been taken to establish the Imperial Mineral Resources Bureau.

2. In accordance with the recommendations for the constitution of the Governing Body contained in Sir James Stevenson's Report, the following representatives have been nominated on behalf of the Governments concerned:—

Chairman of the Governing Body (and Representative of the United Kingdom): Sir Richard Redmayne, K.C.B..
Canada: Dr. Willet G. Miller.
Commonwealth of Australia: Mr. W. S. Robinson.
New Zealand: Mr. Thomas Hutchinson Hamer.
Union of South Africa: The Right Hon. W. P. Schreiner, C.M.G.
Newfoundland: The Right Hon. Lord Morris, K.C.M.G.
India: Mr. R. D. Oldham, F.R.S.
Colonies and Protectorates: Mr. J. W. Evans, D.Sc., LL.B.

3. As regards the proposed representatives of mineral, mining, and metal industries, owing to the magnitude and complexity of the interests involved and the obvious desirability of having at the disposal of the Governing Body the best expert knowledge available, it is desired to increase the number of these representatives to six instead of the four originally recommended in Sir J. Stevenson's Report, to which the Dominion Governments have agreed. If this is accepted by the participating Governments it is proposed to nominate the following:—

Westgarth Forster Brown, Esq. (A leading consulting mining engineer, especially in regard to coal and coal mining; Mineral Adviser to His Majesty's Woods and Forests; Deputy Gaveller of the Forest of Dean, with experience in many Colonies.)

Professor H. C. H. Carpenter. (President of the Institute of Metals; Professor of Metallurgy in the Royal School of Mines.)

Dr. F. H. Hatch. (Ex-President of the Institution of Mining and Metallurgy; now advising the Ministry of Munitions on iron ore supplies. Has world-wide experience in metalliferous mining, and is a member of the Mineral Resources Advisory Committee of the Imperial Institute.)

Sir Lionel Phillips, Bart. (The well-known authority on South African mining; formerly President of the Chamber of Mines, now Comptroller of the Mineral Resources Development Department, Ministry of Munitions.)

Edgar Taylor, Esq. (Of Messrs. John Taylor and Sons; retiring President of the Institute of Mining and Metallurgy; an authority on gold mining.)

Wallace Thorneycroft, Esq. (President of the Institution of Mining Engineers; an authority on questions of iron mining and working.)

4. It is desirable to submit to the present Imperial War Conference proposals as to the position of the Bureau and its status in the machinery of Government.

The duties of the Bureau are thus defined in Resolution XIII, passed by the Imperial War Conference on the 23rd April, 1917:—

> "The Bureau should be charged with the duties of collection of information from the appropriate departments of the Governments concerned, and other sources, regarding the mineral resources and the metal requirements of the Empire, and of advising from time to time what action, if any, may appear desirable to enable such resources to be developed and made available to meet the metal requirements of the Empire."

This definition is expanded, as follows, by Sir James Stevenson's Committee:—

> "(a) To collect, co-ordinate, and disseminate information as to resources, production, treatment, consumption, and requirements of every mineral and metal of economic value.
>
> "(b) To ascertain the scope of the existing agencies, with a view ultimately to avoid any necessary overlapping that may prevail.
>
> "(c) To devise means whereby the existing agencies can, if necessary, be assisted and improved in the accomplishment of their respective tasks.
>
> "(d) To supplement those agencies, if necessary, in order to obtain any information not now collected which may be required for the purposes of the Bureau.
>
> "(e) To advise on the development of the mineral resources of the Empire or of particular parts thereof, in order that such resources may be made available for the purposes of Imperial defence or industry."

5. The constitution, as suggested by Sir James Stevenson's Committee, is as follows:

> "The administration of the Bureau should be controlled by a Governing Body representing the various parts of the Empire, as well as the mineral, mining, and metal industries. This body should be responsible for the appointment of a Director, or such other official or officials as may

be considered desirable, and the necessary subordinate staff, within the limits of the funds available for administrative expenses."

The Committee further suggested that the expenses of maintenance of the Bureau (being a sum not exceeding, for the first year of existence, £10,000 per annum) should, for the time being, be voted by the Imperial Parliament, on the advice of the Minister of Reconstruction, although the view was held by some of the Committee that from the outset direct contributions to the maintenance of the Bureau should be borne by all the Governments concerned.

6. It is proposed that the Bureau should be granted Incorporation by Royal Charter, which should define the constitution and the duties of the Bureau. The Governing Body will be established on the lines laid down by Sir J. Stevenson's Committee, with such alterations as may be approved by the Imperial War Conference.

7. As to expenditure, each Government would, of course, pay the expenses of its own representative. The normal expenditure of the Bureau would be met out of funds contributed by the Imperial Government, as suggested in the Report of Sir James Stevenson's Committee, together with such contributions from the Oversea Governments as they may, by agreement, be prepared to make.

This arrangement shall continue for three years, before the end of which time the question as to the contribution to be made by the Oversea Governments shall be brought up for discussion at an Imperial Conference.

8. Power should be given in the Charter to hold and deal with moneys which would be placed at the disposal of the Bureau by way of grants in aid contributed by the Imperial and Oversea Governments. Annual reports on the work of the Bureau shall be made to each of the Governments concerned.

Resolution XVI.

The resolution made was in the following terms:—

The Imperial War Conference, having considered the memorandum by the Minister of Reconstruction on the Imperial Mineral Resources Bureau, as amended, agrees that the number of representatives of the mineral, mining, and metal industries on the Governing Body of the Bureau should be increased from four (as originally agreed) to six. The Conference further approves the proposal for a Charter of Incorporation as set out in paragraph 6 of the memorandum and the proposals in paragraphs 7 and 8 as to the allocation of expenditure.

In accordance with the recommendation of the Conference the organization of the Bureau has been proceeded with and a charter applied for. Meetings of the Board of Governors, whose names are given above, have been held periodically, and committees on organization, finance, etc., have been at work. Thus far the meetings have been held in the Ministry of Reconstruction, but it is hoped that the Bureau will soon have a home of its own, probably in the vicinity of the Strand or Kingsway. It is already evident that there is much important work waiting to be undertaken by the Bureau which can be of great service to the Empire.

Mr. A. L. Larsen, until recently draftsman for the Consolidated Mining & Smelting Co., at Trail, B. C., is leaving for San Francisco, where he has been appointed to a position with a metallurgical concern.

COAL MINERS DID THEIR SHARE OF WAR WORK.

In discussing the contributions made by the different coal mining centres of British Columbia towards winning the war the labor paper of British Columbia, in a recent issue, gives figures and mentions many individual instances which indicate that the records of all these communities has been all that could be desired.

Introducing the article in question the editor says: "At the commencement of the war it will be remembered that the conditions in the mining industry, in common with many others, were somewhat parlous. Hundreds of long resident miners had already departed for other fields and many to other countries. In addition to these facts the call from Britain for industrial workers was readily responded to, and the commissioners enrolled men freely from the mining camps for this purpose. Many aliens have been introduced into British Columbia, and, particularly on the Island (Vancouver Island), the Asiatic miners have replaced the white by hundreds. Therefore any comparisons of number of enlistments to miners employed would be completely misleading unless these facts are also considered in connection with the very incomplete returns from the whole of the province."

Officials of District 18, U.M.W. of A., which includes Eastern British Columbia and Alberta coal fields, are mentioned as follows:

John Larson, of Lethbridge, a member of the district executive board when he enlisted, who was killed in action.

Jack Price, an active member of the local union of the district, and a candidate at one time for the office of President, who went to the front and made the supreme sacrifice for his country.

Clement Stubbs, a former president of District 18, who was granted a commission and served as a lieutenant. He was twice wounded, but has come through some of the most severe actions with his life. He is a brilliant orator, and his return is looked forward to by fellow workmen, it being anticipated that he will resume a leading place in the counsels and the activities of the labor movement of western Canada.

Then there was W. L. Phillips, another ex-president of District 18, who was killed while on service.

After mentioning specially many of the residents of the City of Fernie, who gave their lives, and printing a long list of the members of Gladstone Local Union No. 2314 who enlisted, some of whose names are numbered among casualties who never will be seen again and others of whom are expected back shortly, Tom Blairmore and "Old" Bill Archer are referred to. They went away with a Tunnelling Corps. Both were well-known and popular, besides being prominent in labor circles. "Bill" returned with rheumatism, only to be killed in one of the Blairmore Mines two days after he went back to work.

The coal miners of Michel, B.C., are credited with having sent one-third of their numbers to the war, the total being 98 men, while from South Wellington, Vancouver Island, there went over forty of the union members. No roll was kept of the number of enlistments from the Cumberland District, Canadian Collieries, Ltd., but it is estimated that at least 300 went overseas. The Nanaimo Mines contributed proportionately.

OPPORTUNITIES FOR PROSPECTORS IN THE COUNTRY TRAVERSED BY THE PACIFIC GREAT EASTERN RY.

In a report just issued by the Geological Survey Branch of the Department of Mines, Ottawa, Mr. Charles Camsell, director of the British Columbia Station, gives an interesting and instructive account of a reconnaisance of the country in British Columbia, through which the Pacific Great Eastern Ry. passes.

After pointing out that the principal mineral deposits of the province are associated with Jura-Triassic rocks he states that the most important occurrences of these rocks along the route of the railway are: The Birken Bank, extending from north of Anderson Lake to Birkenhead River; Pemberton Band, lying between Spetch and Pemberton; the Mons Band, extending from Green Lake to Cheakamus River; while smaller bands are found at Watson, Brew and Bethel. These localities, therefore, are of special interest to prospectors.

"These conditions," Mr. Camsell continues "are most favorable for the occurrence of metallic deposits of copper, lead, zinc, gold and silver, and the whole interior of the coast mountains of British Columbia, therefore, becomes an excellent field for prospecting, and not only the eastern and western borders as was formerly believed to be the case. Fortunately the magnificent system of deep fiords that cut deeply into the heart of the ranges makes it possible to prospect for these bands of stratified rocks and to easily develop any ore deposits that may be found in them. Prospectors, therefore, are urged to pay more attention to the coast mountains than they formerly did."

Referring to the deposit of limonite at Alta Lake, which is now being developed for the purpose of supplying a fluxing material for the Irondale Wn. Smelter, Mr. Camsell states that it covers an area of 60,000 sq. ft., with a length of 450 ft. and a width of 250 ft. Analysis is given of 40.98 to 48 per cent metallic iron; 0.2 per cent to 1.80 per cent sulphur; 0.1 to 1.88 per cent phosphorous; and 1.24 to 2.2 per cent silica. Other small deposits of similar ore occur in the neighbourhood, originating from the decomposition of pyrite bearing rocks.

An examination also was made by Mr. Camsell of the district adjacent to the headwaters of the Indian River, where several claims have been located east of the Britannia Mine ore zone. He considers most of the deposits of a character different from that of the Britannia. A band of stratified rocks a mile or more in width extends along the valleys of the Indian and Stamish Rivers. These rocks are surrounded by the granite batholith and intersected by numerous dykes.

On the Belle group are four outcrops of ore which are respectively four feet, seven feet, ten feet, and thirty feet in width, and from which samples are said to average 3 per cent copper. The Bulliondale group is located on an extension of the same ore zone as the Belle. The London group has a large iron-stained outcrop in granodiorite, through which the pyrite is abundantly disseminated with a little chalcopyrite and some molygdenite. The Roy group was purchased last spring by the Britannia Mining & Smelting Co. for $25,000 cash, and Mr. Camsell found on this group copper ore of high grade covering a surface area of 2,300 square feet. Bunches of pure chalcopyrite are common. Development consists of stripping and diamond drilling.

Mr. F. M. Bancroft, of the Geological Survey, makes a summary report on the Slocan District in which connection he refers to the Manganese Deposits near Kaslo, B.C., and points out that the primary silicate, rhodonite, occurs in Ainsworth, Yale and Kamloops mining divisions. A close search, it is suggested, should be made for ores of zinc and superficial ores of manganese in the vicinity of these deposits. The mineral occurs near Kaslo in a vein three feet to four feet wide, between graphic schist and chlorite schist and is due to hydrothermal solutions occurring along a contact fissure.

The secondary deposits of manganese near Kaslo are declared to be the most notable yet discovered in British Columbia, the grade being good and averaging 48.14 per cent manganese and 1.65 metallic iron.

With reference to the Lardeau Mining Division, Mr. Bancroft states that the surface indications in the Lardeau Valley and through the whole central mineral belt are good and merit more intelligent investigation for gold, while the mineralization compares favorably with that of Sheep Creek, Ymir, Nelson and Bridge River. There are silver-lead deposits at the head of Cascade, Poplar, Tenderfoot and Mobbs Creeks. Manganese, tin, platinum and nickel are to be regarded as minerals of possible importance in this district and it is pointed out that pyrrhotite from the Queen Victoria mine at Beasley, west of Nelson, carried 0.41 per cent nickel.

Lorne Mine, Cadwallader Creek.

One of the promising gold properties of the Cadwallader Creek District, Kamloops Mining Division, is the Lorne Mine. During the past year, owing to labor scarcity and the comparatively low value of gold, the work has been confined largely to development. From development there were milled about 380 tons of rock yielding 192 oz. gold and 37 oz. silver.

Pioneer Mine.

The Pioneer Mine is another gold property of Cadwallader Creek which has been operated steadily during the greater part of the past year. Milling was started on the 10th March last and ceased on the 21st of July following. The sinking of a shaft was continued from the latter date, and now is down 280 feet from the collar. Drifting has been carried on at the 280 foot level for 120 feet and good values are shown. Headgear, hoist house and blacksmith shop were destroyed by fire on November 17th, but milling is expected to recommence in a short time. Gold produced during the year up to the 16th November totals 1,925 ozs., and it is estimated that the output to the end of the year will aggregate 2,500 ozs.

Plant Installed at Ida May Mine.

At the Ida May Mine, also situated in the Cadwallader Creek District, a reduction plant consisting of a small jaw crusher, a Huntington Mill, with a capacity of 10 tons every 24 hours, and an amalgamating table were installed during the past year. Power is supplied by a 10 h.p. gasoline engine. In a trial run 30 oz. of gold was secured. The property now is closed down, but it is expected that it will be again operated in the spring.

Mr. F. H. Hawkins, who for several years past has held the position of Chief Assayer for the Standard-Silver Lead Mining Co. of Silverton, B.C., has gone to Anyox, B.C., to accept a situation with the Granby Consolidated Mining & Smelting Co. Mr. Thomas Brown will succeed Mr. Hawkins at the Silverton Assay Office.

Shell Company Would Explore Northern Alberta for Oil

A story comes from Ottawa, by way of Winnipeg, which has aroused considerable comment and even excitement in the Canadian west. It is to the effect that a British corporation, the Shell Transport and Trading Company, Limited, is to be given a blanket concession to enter upon and develop all the oil-bearing lands of Canada lying in the Province of Alberta and north of the Athabasca River. The company is to have a free swing for five years to investigate the geological conditions of this vast territory and develop the same. The concession is to be in the nature of a vast monopoly, except that the rights of prospectors and lease-holders already on the ground are to be respected. The company is to do the exploration and development work at its own expense. The oil thus produced is to be handled by the company, which agrees to pipe it to the head of the lakes or to Vancouver. The company is to have a return of six per cent upon its investment, and the remaining profits are to be divided on a fifty-fifty basis between the oil company and the Dominion Government.

The story is substantially set forth in a despatch from Ottawa to The Manitoba Free Press, the leading newspaper of western Canada and a staunch supporter of the Union government. The Free Press correspondent says that the initial negotiations were conducted last summer in England between the directors of the Shell Transport and Trading Company, Limited, on the one hand, and on the other hand by Sir Robert Borden, Hon. N. W. Rowell, Hon. Arthur Meighen and Hon. J. A. Calder, representing the Dominion Government. No conclusion was thus arrived at, but the proposal is not said to be under consideration by the cabinet at Ottawa, and a devision is expected at an early date.

In justification of the proposed concession, it is stated that the vast oil-bearing lands of Alberta, are not being developed as they should be, and that the only oil company in Canada of sufficient financial strength to undertake their development is the Imperial Oil Company, a subsidiary of the Standard Oil Company of the United States. It is felt that the vast deposits of oil north of the Athabasca should be kept under British control and that if not developed by the Dominion Government as a national undertaking its development should be entrusted to a British corporation. The Shell Transport and Trading Company, Limited, has a capital of fifty million dollars and has large holdings in oil and concessions for the development of the same in Rumania, Egypt, Borneo, Sarawak and the United States.

The Ottawa correspondent of The Free Press evidently considers the proposed bargain to be a good thing, and in the course of his despatch says: "Under the present system of oil exploration in the Dominion private individuals may secure a lease on 1,900 acres. They have little in the nature of expert geological recommendations to go upon. Moreover, if they do strike oil the problem of refining it and bringing it to market is still to be faced. There would appear to be only one company in the Dominion capable of meeting that problem at the present time, namely, The Imperial Oil. But there are no indications that that company desires to embark upon Canadian oil exploitation in the west. The Shell Company undertakes, if oil is found, to establish refineries and to undertake the piping of the oil to the head of the lakes or to Vancouver. The proposal has but recently come before the cabinet. It is under consideration now and a decision one way or another may be expected at an early date."—Toronto World.

H. H. STEVENS URGES GOVERNMENT OWNERSHIP OF SMELTERS AND REFINERIES IN BRITISH COLUMBIA.

Government ownership of smelters and refineries is advocated by Mr. H. H. Stevens, member of the Canadian House of Commons for Vancouver, B.C. Discussing the possibility of the development of a large metal manufacture trade in the Pacific Northwest, Mr. Stevens said that it was a matter which he had taken up with the Dominion Government, and with experts retained by the government. "In my opinion," he said, "we must begin, in British Columbia, with copper, zinc and lead. The first two are essential to the manufacture of brass. There is not only the home market in Canada, but a huge trade to be developed in the Orient in all kinds of metal manufacture." The raw materials were to be obtained by the establishment by the Dominion Government from its own smelters and refineries on this coast. Concerning the ore supplies necessary, he stated:

"As the mineral resources and their administration are under control of the Province, the co-operation of the Provincial Government would be necessary. As a carollary to the establishment of a Dominion smelter and refinery it would be necessary for the Provincial Government to impose such restrictions on the export of ore as would tend to direct these supplies to the Dominion smelter and refinery. It goes without saying that the smelter would have to give terms equal to those of the present smelters on the coast.

"As everyone knows, all the big mines and smelters except those of Trail, B.C., are owned by the American 'Copper Ring.' And even Trail is in the hands of the 'Ring' when it comes to marketing its product.

"The effect of a smelter operated in Vancouver would be to break the monopoly of the American 'Ring' as far as the metals of this Province are concerned. The Government could carry its product until market conditions were favorable, which might not be possible with a privately owned concern.

"No doubt, too, the establishment of such a smelter would result in the development of many new mines up the coast, and the extension of those now opened up as a constant market for their ores would be provided.

"Australia, Japan, China and all the other trans-Pacific countries use large quantities of manufactured metals, purchased largely in the United States. Our own raw metals go into those manufactures and American manufacturers derive the trade and the profit.

"The question of a smelter is now before the Government, backed by all the members from British Columbia and it will likely be brought up in the House of Commons during the coming session."

The Mining Convention, which was to have been held in Vancouver, B.C., under the auspices of the Vancouver Chamber of Mines during the first week in January, 1919, has been postponed indefinitely.

Rossiter W. Raymond

Secretary Emeritus, American Institute of Mining Engineers.

Dr. Raymond, to whom the term dean of mining engineers was fitly applied, passed away at his home in Brooklyn, N.Y., on Tuesday, December 31st. While the American Institute of Mining Engineers, with its world-wide membership, will always remain a monument to his genius, he was no narrow specialist. He was not only a great mining engineer, especially in the services rendered by him to the jurisprudence of mining, but was one of the greatest authors and one of the most eloquent speakers of his or any other generation in the technical world. At the dinner given by his friends in commemoration of his seventieth birthday, in New York, in 1910, Dr. Raymond's activities were epitomized by his pastor, the Rev. Dr. Lyman Abbott, of Plymouth Church, the successor of the great Beecher, as those of "sailor, soldier, engineer, writer, author, teacher, biblical critic."

Dr. Raymond was born in 1840, and when 18 years of age he set sail for Europe as a student. He became a recognized mariner before landing . . . . .

"The good old Black Ball liner 'Great Western,' on which I embarked as a passenger in 1858, and became the third mate before the long, disastrous voyage was over, and the crippled vessel, with half a rig and half a crew, and on half allowance of water, crawled down the Irish Channel to reach Liverpool, and surprise the underwriters.

"After that initial unforeseen experience, I was brought by sea and land into contact with many peoples and many literatures, in scenes of peace and scenes of war; and I can now see that I unconsciously obeyed the maxim of Browning,

'Get thy tools ready,
God will find thee work.'

So that, when my work came to me, I was, without my own prevision or predecision, prepared to understand it, to love it, and, up to the measure of my strength, to do it."

From 1861 to 1864, Dr. Raymond served in the Union army in the great civil conflict.

A well known poem by Dr. Raymond is entitled The Grand Canyon, "the first line of which declares the great truth that the thoughts of God are on earth expressed."

As an author and critic, outside the domain of mining, it has been said, "Dr. Raymond has written excellent stories and his commentary on the Book of Job is a fine piece of biblical criticism."

Many writers, with more facile pens than ours, will describe Dr. Raymond's accomplishments and his achievements. We cannot do better for Canadian readers than to give quotations from speeches made by him in this country. They are messages to us which apply as well to-day as when they were delivered. Furthermore they illustrate Dr. Raymond's style as a speaker and a writer and his breadth of view.

During the last twenty-five years, under direction of Dr. Raymond as secretary, the American Institute of Mining Engineers has honored Canada by holding four meetings in this country. The term American, in so far as the Institute is concerned, as Dr. Raymond was fond of emphasizing, means North American, and does not apply merely to the territory south of the Great Lakes. The Institute has always had an active membership in Canada and this country has almost always been represented on its Council or Board of Directors.

In 1893, the Institute met in Montreal, with excursions in the adjacent parts of Quebec. In 1900 Quebec and Nova Scotia were visited. The British Columbia meeting of 1905 included an excursion to the Yukon. The mining men of Ontario had the pleasure of acting as hosts in 1907, the sessions being held in Toronto, with excursions to Northern Ontario.

At the meeting in 1900 the reverend Dr. James Douglas was President of the Institute. The following is from a speech at Sydney during that meeting by Dr. Raymond, with which most of us will agree as to the great benefits, other than technical, that are derived from membership in such societies as the A.I.M.E.

"I have been connected with the American Institute since 1871; it then had thirteen members, but it now has three thousand. If you come to any meeting of that Society and think that by sitting down in a hall and hearing some papers read you have struck the heart of that society you make a huge mistake. It is on the train, in the wagon, at the hotel over the evening pipe—I am afraid sometimes it is over the evening hot Scotch—that you will find the real work of that Institute going on. We learn more in our interchange of reciprocal feelings, we teach more in our talks, in our clasping of hands, in our social intercourse, than we do on the printed page . . . . It is not a question of piling up statistics as a permanent record, but it is a question of welding these people who do things into a social, harmonious and organized institution. Our institution was the first on this continent to do that on a large scale, and these societies of ours have welded together a great profession and made it a great factor for happiness and prosperity and knowledge among men. That is why I like to hold meetings anywhere."

At the Toronto meeting a reception was given by the Government in the parliament buildings to the members of the Institute and their guests. Adjournment was made to the legislative chamber, where several addresses were delivered. A part of Dr. Raymond's speech on that occasion may be quoted:

"I have spoken a good many times on Canadian soil. Some of you remember that in Vancouver, two years ago, I paid a hearty tribute to the achievements of Canadian engineers: and some may recall my address on the same subject, made in 1889, at Ottawa, in the presence of that great man—great man, I say, whatever party judges him!—Sir John Macdonald. I could only repeat to-night what I have said before, but with added emphasis. Years ago, I supposed that the conquest of this continent had been completed. I remember being very eloquent, somewhere or other, about the way in which the American mining engineer went on into the wilderness; and how Nature, which had lain for thousands of years in sleep and solitude and silence, like the Beauty in the fairy tale, woke at his coming, and rose, and smiled and gave herself to him, with all the glory of her beauty, and all the bounty of her treasure. Oh, I was very eloquent about that! I thought it had all been done; and that we had done it—we Americans; and I told the

young men of my generation that they might yet achieve great things, but not so great as the achievement of their fathers; that they might live to see wonderful epochs in human history, but there would be no future age like that, because there were no more worlds to conquer. The 'winning of the West' I thought we had completed. But lo! here was another empire in the North; and that world, too, our tall Canadian brethren are conquering. All hail to them! May they do better than we have done! But let them never forget that we and they follow a common purpose and share a common glory!

Among the numerous biographical notices of departed members of the Institute that Dr. Raymond wrote, quotations from one are especially appropriate at the present time. Many young men are now returning to Canada from the Great War, as did Dr. Raymond, and the subject of his sketch from the great strife nearly 55 years ago. Many of our young men have had their school and college courses interrupted, and will now find it hard to take up their work again. Will there not be encouragement for them in the life of one who, in the long ago, like them faced similar difficult conditions and triumphantly overcame them!

"Upon his discharge in 1865, he returned at once to his rural home and took up his life again, just where he had laid it aside. I had almost written 'laid it down'—and if I had done so, I could have defied the critic, and the proofreader, for he had as truly laid it down as if the sacrifice had been accepted and ratified by death. That the life thus freely offered was returned to him, did not impair the completeness of the sacrifice. His escape from the death he had dared was only a Voice which said, 'I have further use for thee!' So, at least, I understand it; and so, at least, did he! And I must add here, as a part of my picture of the man, that he never 'traveled' on his military record. He did not run for office on the strength of his army service, or urge it as a claim to civil distinction or preference. I think he regarded it as an episode, such as every good citizen should meet like a man—without bragging about it afterwards. I think he would as soon have paraded his honesty as his patriotism. Such things, in his view, 'go without saying,'

"So the crippled veteran of 23 went back to the Oxford Academy to prepare for college, with nothing to show in that line for the three years he had lost except when he had managed, in camp, to get out of his Latin grammar and reader, and, possibly, also a certain amount of fidelity, patience, and indomitable perseverence and courage, which had been both revealed and trained in the service of his country. And in 1867, as a man of 25 years, he modestly entered the Freshman class at Yale, along with a host of youngsters, who had not wasted any time in soldiering. Moreover, he did not cut short his college course on the ground that so much time had been lost, but went through the whole of it, shirking nothing, just as if it had been simply another campaign, and finally, in 1871, he took his degree as A.B. with his class."

. . . .

"At this point, I would pause again to call attention to the exceptional character of this example. Here is a man who has become 32 years old before entering upon his professional work. The delay has been due to intervals of three years and one year, sacrificed by the man himself, at the call of what he deemed higher duty—the first to patriotism, the second to presonal honor. But the original plan of the youth has been carried out, irrespective of these interruptions, without one iota of abridgement or change; and the man stands at 32 where he might have stood at 28, or even (if he had decided to ship his classical college-course, and plunge at once into his technical course) at 24.

"Yet, does he really stand only where he would have stood four or eight years earlier, if no time had been 'lost'? Is it nothing that a man, having been a soldier, knows how to be a comrade—to meet and understand and win to hearty co-operation other men? Is it nothing that, having gained through a classical education the ability to comprehend the lessons of history and the inherited associations which actuate, even unconsciously, the men of to-day, he is able to communicate convincingly to others what he knows himself? Is it nothing that he has shown himself to be a lover of his vocation, yet capable of sacrificing even his vocation to duty and honor? Finally, is his certified professional ability less likely to win professional employment and success, when backed by that other certificate, furnished by a wide experience with men and their enterprises? These, and other like questions are answered by the subsequent career."

The American Institute of Mining Engineers was founded in 1871. At the organization meeting at Wilkes-Barre, Dr. Raymond was elected temporary secretary. He was President in the period 1872-1874. In 1884 he was elected Secretary, a position he occupied till 1911, when he became Secretary Emeritus. During this period he saw the membership grow to over 6,500, at the end of 1917, with a corresponding increase in usefulness and influence.

Many honors were bestowed on Dr. Raymond by universities and technical institutions. Of these it will suffice to mention that he was an Honorary Member of the Iron and Steel Institute of Great Britain, of the Institute of Mining and Metallurgy and of the Societe des Ingenieurs Civils de France. — W. G. M.

DECLINE IN U. S. GOLD AND SILVER OUTPUT.

Washington, January 2.

Gold production in the United States in 1918 fell to 3,313,000 fine ounces, worth $68,493,000, the lowest in twenty years, and silver production dropped to 67,879,000 fine ounces, worth $67,879,000 at the standard Government price of $1 an ounce, the smallest record since 1913, according to the joint preliminary estimate of December of the Mint Baker and the Geological Survey, issued recently.

Return of normal conditions and falling of prices are expected to stimulate gold production in the United States this year, according to views of members of the Treasury's Committee appointed to suggest a remedy for the falling production of last year. Consequently it appears unlikely that the committee will recommend any unusual measures to stimulate production when it makes its report in a week or two.

Rapid mounting of the cost of mining is assigned as the cause of the decline, which is shown by comparison with the 1917 production of $83,750,000 worth of gold and 71,740,000 ounces of silver.

Metal Producers Expect Temporary Lull In Business

Victoria, B.C.

With the announcement, made a few days ago, that British Columbia copper ore shippers to the Tacoma Smelter will have to content themselves with a settlement hereafter on a basis of 11 cents a lb., mining men are speculating as to what is ahead of the industry. Producers here must receive at least 10 cents for blister copper on a 15 cent. market, or discontinue, as there must be allowance for transportation and treatment charges. That the Government price in the United States of 26 cents a lb. is purely nominal and that it is not likely to continue for long in any event, in view of the very large excess supply which the end of the war found on hand, is thoroughly appreciated by those interested. Consequently they are asking themselves what is to be done to right conditions. It is felt that the outlook is not very bright, as far as the immediate future is concerned, at any rate, but there is general confidence that, with the end of peace negotiations and the inauguration of a period of re-construction the demand for copper will become so brisk that the industry of the Province will find itself again with plenty of orders and continued activity assured. By the time this occurs British Columbia will be, or should be, in a position to very materially increase her output, which for 1918 will approximate 60,000,000 lb. The Canada Copper Company will be producing from the Copper Mountain property, and both the Consolidated Mining & Smelting Co., and the Granby Consolidated Mining & Smelting Company will have developed mainland and island properties to the point where they will take places among the large shippers of the copper properties of the Canadian west.

The position with respect to lead is another matter which is giving some concern, inasmuch as the price has fallen, according to information at the time of writing to 6¾ cents a lb. It will be recalled that the Consolidated Mining Company's management at the Trail Smeltery recently issued an order in which it was stated that, owing to the fact that a serious condition had arisen in the Canadian lead market, interest would be charged on money advanced to lead producers. In the course of the announcement reference was made to a large quantity of lead which is in the hands of the Imperial Munitions Board, and is "hanging over the market." This lead is in Canada, and it has been learned that the Imperial Munitions Board has arranged for its exportation, with the idea of relieving the embarrassment which its presence causes to the Canadian market. Mr. F. A. Starkey, of the Associated Boards of Trade of Eastern British Columbia, expresses himself as highly gratified with the latter development, saying: "The sum and substance of the whole thing is that we will now have a clean sheet to start off with. The action of the Board is timely. On December 9th, while in Spokane, I sent a wire to the Board pointing out that the dumping of the lead bought for munitions on the commercial market at this time would mean a glutting of the market, and that would be disastrous to the lead mining districts. But the difficulty is now settled." Mr. Starkey's wire to Sir Thomas White, Acting Premier, read: "During war shippers did not have benefit of Canadian duty, but sold Imperial Munitions Board at practically U. S. prices. Now that the war is over shippers expect that Canada will not be made a dumping ground for Mexican and U. S. surplus and scrap metal." Whether the action taken by the Board with reference to the stock referred to will have the effect which Mr. Starkey looks for is doubted by some who point out that Canada's biggest market is not local, and that the placing of munition lead elsewhere will have the result of reducing the demand for the Canadian production at least for a time, and that, at the best, the prospect is that there are a few dull months to meet.

Zinc at 7¾ cents a lb., with a comparatively inactive market as far as the output of British Columbia is concerned, is not very promising to the industry, but the Consolidated Mining & Smelting Company, it is felt, will be able to keep its refinery in operation by virtue of the bounty provided by the Dominion Government.

The future, however, looks much brighter for gold and silver properties. Gold producing mines are preparing to increase production, and it is confidently expected that in the coming months British Columbia resources in this respect will be largely developed, and those which are past that stage will be exploited to capacity.

The platinum placers of the Tulameen River are likely to receive attention at the hands of private companies, the operations of the Dominion Government in this locality having demonstrated the possibilities. The cessation of the war having affected the demand for molybdenite, chromite and manganese, it is not probable that there will be the active prospecting for these ores that has marked the past year or more. What will be done with the properties of this character located, and to some extent developed, remains to be seen.

The whole situation, to the minds of western operators, appears very complicated. To use their own words "the whole thing at present is mixed up, unsettled and unsatisfactory. We are in for a period of slack times evidently; but it is not likely to last more than for the period of peace negotiations. With an European settlement and the actual commencement of reconstruction there is no doubt that the demand for copper, lead, zinc and other ores will be revived and the industry will jump back as far and beyond the position which it gained during the war. Meanwhile, it is hard to say what is going to happen. We believe, however, that the smelters will be able to continue operations, possibly not on as large a scale, but sufficiently to tide over the hiatus."

RESTRICTIONS ON EXPORT OF BRITISH MANUFACTURES REMOVED.

Important cable dispatches have been received by Mr. G. T. Milne and Mr. F. W. Field, the British Trade Commissioners at Montreal and Toronto, respectively, from the Imperial Department of Overseas Trade in London pointing out that since the armistice was signed many restrictions on commerce have been withdrawn, while in the case of those which remain, licenses are being granted much more freely than previously. Particulars regarding these relaxations will be published weekly in the "Board of Trade Journal," the official organ of the Imperial Government for notices regarding trade.

Orders placed during the war period now have good prospects of being executed, and arrangements for

new business should be made without delay.

The following relaxations in particular should be noted:—

1. Permits to manufacture and Priority Certificates in connection therewith are no longer necessary.
2. Firms are at liberty to accept civil or commercial orders for immediate execution, thus freeing the engineering industry among others, for commercial work.
3. All the principal kinds of raw materials may now be used for the commercial manufacture of goods for export, but these raw materials themselves may not be exported in certain cases without licenses. Among those to which this condition applies are the following: Aluminum, antimony, brass, copper, iron, lead, nickel, spelter or zinc, steel and tin.

In general, restrictions on the export of manufactured goods have been removed, while they have been retained in the case of raw materials.

CONSOLIDATED MINING & SMELTING CO. OF CANADA.

An Active Year, but a Decrease in Profits.

An active and in some respects an expanding business, but one showing less profit than during the previous year, is revealed by the annual statement of the Consolidated Mining & Smelting Co. of Canada, which carries on large operations in British Columbia. The net profit for the year ending September 30 last was $867,259, compared with $1,076,828 in the previous year. This was after providing for $81,986 in taxes, writing off $408,557 for depreciation, and charging profit and loss account with $219,202 in development of properties during the past year. In 1917 $648,058 was written off for depreciation and $380,071 charged for development.

"Taking into consideration the recent improvements in metallurgical processes," says President W. D. Matthews, "and the enhanced value of the company's mining properties on that account, your directors decided to continue payment of dividends at the rate of 10 per cent per annum, charging to profit and loss account the deficit of $180,485. The balance at credit of profit and loss account now stands at $2,148,122." The balance at credit of profit and loss a year ago was $2,360,274. The season's metal product exceeded $10,500,000 compared with $13,000,000 in 1917.

"The continuous increase of the scale upon which the company has been operating for the purpose of meeting the copper, zinc and lead requirements of the Imperial Munitions Board," says Mr. Matthews, "and the development of new processes, especially those involved in the electrolytic treatment of complex zinc ores, have involved the expenditure of a large amount of money for new plant, but your directors hope that the result will be that the company will thereby be able to produce metals profitably at prices which may be expected to prevail under peace conditions. The cost of the new construction which was found necessary from time to time greatly exceeded the estimates by reason of the excessive and continually increasing costs of labor, materials and supplies of all kinds. Your directors, owing to these increased expenditures and to the interruption of operations during the first part of the year, have not been able to reduce the bank overdrafts as had been hoped and expected."

An issue of $3,000,000 in 7 per cent debenture bonds is planned. The power development of the West Kootenay Power & Light Co. will be extended and the copper refinery capacity increased from 20 tons to at least 50 tons per day. These capital expenditures will amount to at least $1,500,000. The company's assets are now placed at $17,099,923, compared with $16,994,568 last year.

Reports of company officials speak of the high cost of materials, delicate labor situation, and decision of the Imperial Munitions Board to pay but little if any more for lead requirements than these could be secured for from foreigners, though costs are higher in Canada. "At the same time," says Mr. James J. Warren, the Managing Director, "it must be realized that war activities have resulted in the establishment on a firm footing in Canada of industries engaged in the production of high-grade zinc and refined copper. The fabrication of these metals is bound to follow in due course."

FOUR ROPE HOISTING SYSTEM FOR NANAIMO COLLIERIES.

Experiments have been at progress at the collieries of the Canadian Western Fuel Company, Nanaimo, B. C., for the last two months in the effort to arrive at a solution of the problem of rendering impossible, or reduring the possibility to a minimum, a repetition of such an accident as that of last September when the rope used in Protection Island Shaft broke, causing considerable loss of life.

The ingenuity of Mr. Thomas Price, master mechanic for the company, has resulted in an arrangement which seems to come very close to meeting requirements. He has devised, and demonstrated its practicability in actual operation, a working model of a four rope hoisting system.

Mr. George Wilkinson, Chief Inspector of Mines, describes the arrangement as follows:

"There are four complete hoisting ropes, an overwind rope and an underwind rope on each compartment of the drum. Four pulley wheels are used, two of them being set some distance above the other two to avoid fouling of the ropes.

"The ropes on the two upper pulleys cross. A drum of the usual dimensions is used. Having an overwind and underwind rope on each compartment, the one rope is being unwound while the other is being wound.

"As the under rope is being wound on the drum and hoisting the cage, an overwound rope is being unwound and descending with the cage in the opposite compartment. The operation is the same on the other side of the drum. The whole operation is made feasible by simply crossing the two ropes that lead to the two upper pulleys."

Mr. Wilkinson asserts that this is one of the simplest and most practical arrangements he has seen on using safety ropes. He points out that everything is under control of the engineer, the same hoisting speeds being used on all ropes. Any possibility of slipping is avoided because all ropes are fastened to the drum.

Preparations are being made by the Western Fuel Company for the installation of this double rope system at their new mine, the Wakesiah, near Nanaimo, B. C.

The Canadian Honorary Advisory Council for Scientific and Industrial Research*

By DR. A. B. MACALLUM.

"Reconstruction and Development" in Canada in the new era of international girding for supremacy in the arts of peace means to the Canadian Honorary Advisory Council for Scientific and Industrial Research much in so far as "development" is concerned, but little in regard to "re-construction." Re-construction postulates the building up again of what existed before; and up to the outbreak of War there was constructed in Canada no national organization for research work. The glowing path of Canada's opportunity for industrial development runs wide and far, but the Council's research path has to be blazed through a comparatively unexplored forest. It is almost entirely new ground to be covered.

Where Germany and, though perhaps in lesser degree, the United States had builded before the war great organizations for industrial research founded on wide-visioned realization of the commercial value and necessity of applying science to industry, in Canada, as in Great Britain, state encouragement and individual enterprise had, until the war started, been content in the main with a laisser-faire policy. Germany had her trained technologists and research workers by the thousands in every field of industry, and, through the organized application of science to industry, was winning her trade victories in every foreign mart.

In the United States, which early took a leaf from Germany's book, the great Universities like Harvard, Yale, Chicago, Columbia and Cornell had staffs and equipments in pure and applied science, which kept pace or almost kept pace with the demand from great American industrial establishments for trained scientific investigators, chemists, electrical engineers, metallurgsts, etc. to solve industrial research problems. The annual budget of the Massachusetts' Institute of Technology, for instance, exceeded before the War, and still exceeds, the total of the annual expenditures of all the Faculties of Applied Science in Canada. There are some two thousand research laboratories in connection with large industrial concerns in the United States, and each of more than fifty individual firms expend annually sums ranging from $25,000 to $500,000 for research.

In Canada in a score of years less than twenty students have received the advanced (Ph.D.) degree in science from the University of Toronto and fewer still from McGill. Not two per cent. of Canadian firms have research laboratories and only about ten per cent. have routine laboratories, chiefly for the testing of materials. If Canadian industries were to seek for a supply of trained technical men capable of applying the most advanced scientific knowledge to industrial processes sufficient to meet even their most ordinary needs, the number of adequately trained men available would not be sufficient to satisfy five per cent. of the demand.

That, briefly put, is the situation with regard to the needs in Canada for equipment and men for research work. That is the situation that has confronted the Research Council since its creation in December, 1916. And that has been, and is, the crux of all problems of scientific and industrial research in Canada, handicapping the carrying out of the large research programme planned for the past year and for the coming year, jeopardizing Canada's position in the international rivalry for export trade and demanding prompt remedy if the full measure of our opportunity is to be grasped. In resources of capital and materials, in all the natural advantages for industrial supremacy we are in an enviable position as compared with our trade competitors. But in regard to the vital question of scientific organization of our industrial processes of finding new uses, hence new markets for the raw materials and the by-products of manufacture, and of keeping pace with the advances made in other countries through research, we have as yet hardly touched the fringe of opportunity.

Confronted with this situation and with a slowly awakening public and individual realization of its portent, the main task of the Council this past year has been, while carrying on the immediate needs of research work with the means at hand, to pave the way for meeting adequately the urgent needs of the future. The goal has been a supply of trained men for research work, adequate equipment and facilities for research and the enlistment of industrial organizations in co-operative effort to solve common problems, the solution of which lies in the application of science to industry.

A Central Research Institute.

The great forward step taken has been to promote the establishment of a Central Research Institute at Ottawa, combining the functions of the Bureau of Standards at Washington and of the Mellon Institute at Pittsburgh.

The proposal for such an Institute, submitted to the Government in November last, was the result of many months' careful investigation by the Council.

In view of the situation above outlined, the argument advanced in support of it is so obvious as to need no re-statement here. There has been a prompt and appreciative response to the proposal by the Government and by all the public interests concerned. There is good reason to believe that the Institute will be established without any unnecessary delay. It will involve an expenditure of $500,000 for a four-storey building, having initial provision for fifty laboratory rooms and with plans so drawn as to provide for expansion as the needs develop. The cost of the scientific equipment is estimated at $100,000, and the cost of maintenance, salaries, etc. at about $100,000 per annum for the first few years.

Trade Guilds.

The establishment of the Institute is the necessary first step towards placing industrial research work in Canada upon an adequate and permanent basis and towards enabling the Dominion to keep abreast of similar progressive methods in the United States, Great Britain, Japan, France, Australia and our other trade competitors. It will, doubtless, be followed by the or-

*Written for the Toronto Globe's annual financial survey issued on Jan. 2, 1919.

ganization of trade guilds or associations for research in each branch of industry, formed to pool resources in solving common problems and to take advantage of the laboratory equipment and opportunity offered, under the Council's proposals, by the Government-maintained Institute.

Training of Scientific Workers.

A further necessary step will be the working out of the Council's plans for more adequate provision by the Universities for the training of qualified scientific workers. In the more generous investment of state funds for this purpose, starting, say, with Toronto, McGill, and L'Ecole Polytechnique, lies the hope of securing for the ensuing years of the world's strenuous and pitiless trade warfare the nation's leaders in scientific and industrial research.

Research Problems Undertaken by Council.

Apart from these crucial phases of the work and aims of the Research Council, space permits only passing reference to some of the many research problems already undertaken.

$400,000 for demonstration plant.

As a result of the Council's initiative, Governmental action was taken in June last to secure federal cooperation with the governments of Saskatchewan and Manitoba in establishing a demonstration plant in the Souris coal areas of Southern Saskatchewan, to prove the commercial feasibility of carbonizing and briquetting the Western lignites for heating, in domestic furnaces. This year will see a plant established with an outlay of $400,000 and an annual output of 30,000 tons of coal equal to the Pennsylvania anthracite and marketed in Regina or Moosejaw at, at least, two dollars per ton less than the imported anthracite is now costing. The success of the initial plant, about which there can be little doubt, will lead eventually to the development of the immense and little realized latent lignite resources of Saskatchewan and Alberta, relieve for for Ontario and Quebec the present coal famine through limited American supply and save to Canada the five or six millions of dollars now annually going to the United States for coal for the prairie provinces.

Study of growth of trees.

A systematic study of the rate of reproduction and growth of Canadian forest trees of the commercial species has been undertaken through scientific survey of some eighty square miles of an old cut-over lumber district on the Petawawa Military Reserve. The data being secured will in the course of a few years give, for the first time, the essential definite information enabling the Dominion and Provincial Governments to inaugurate on a scientific and practical basis a scheme of re-forestation paralleling the best results obtained in the past in Europe. Our forest wealth, now in danger of exhaustion through reckless waste and disregard of adequate conservative systems, can only thus be preserved as a great and permanent national resource.

Tar fog research.

The tar fog research, initiated in 1917, has been continued with satisfactory practical results which will doubtless lead in the near future to the application to various plants in Canada of a new electrical process for the recovery of valuable by-products now lost in the destructive distillation of coal, wood, etc.

The research on sound measurements and fog signalling conducted in 1917 by Dr. Louis King of McGill has made further progress this year and forecasts a new type of sirens for use on the St. Lawrence River and Gulf.

Research work connected with the recovery of industrial alcohol from the enormous sulphite liquor waste of our Canadian pulp mills points to the installation of recovery plants and the production in Canada, at decreased costs to consumers, of the alcohol increasingly needed for industrial purposes and as a substitute for motor fuel.

There has been a score or more of other phases of industrial research initiated or continued during the year, each having a practical bearing on some branch of national production. More should and could be done, were trained men and money available. The Council's budget for the year has been under $100,000. In Great Britain, Parliament has recognized the need and the opportunity by creating a separate Department of Scientific and Industrial Research and has voted one million dollars per annum for five years to be expended by the Research Council. In Canada we, too, are learning the obvious lesson taught by Germany and already adopted by British industry. The path has been blazed for replacing rule of thumb methods in Canada by scientific investigation.

Special Correspondence

BRITISH COLUMBIA.

Will Install Plant at Meteor Mine.

The Meteor mine near Slocan City, B.C., has been bonded by Messrs. J. C. and W. A. Buchanan, the consideration given being about $45,000. It is a silver mine, but the ore carries also gold values. Twenty-two tons of the high grade ore was shipped to the Trail Smeltery recently. It is the intention to install a compressor in order to facilitate the carrying on of development work on a large scale. Mr. W. A. Buchanan will manage the mine

Aerial Tramway for Mountain Chief Mine.

Another gold-silver property of British Columbia to change hands recently is the Mountain Chief at Renata, which was bonded by J. W. Evans, of Revelstoke, B.C., the figure involved being understood to be $100,000. Mr. Evans plans to carry on operations in a more extensive manner than the previous owners, one of the first pieces of work to be undertaken being an aerial tramway from the mine to Arrow Lake. With this facility for transportation he figures on materially increasing the present output of 200 tons a month.

Cassiar Crown Strikes Good Ore.

The strike of a considerable body of copper ore of good grade is reported from the north of British Columbia, Hazelton District. The property on which this promising development has taken place is owned by the Cassiar Crown Copper Company. Although work has been maintained for several years past, nothing of special note was discovered, though there was sufficient ore of good quality shown to encourage the owners. Early in the past summer the company awarded a contract to run a short tunnel on the Ruby Claim, one of the group. A short time before the contract was completed the crew began breaking into ore, which widened with every round until, with the completion of the tunnel contract, they had exposed a vein fourteen feet in width with ten feet of clean ore.

Constructing Tipple at Diamond Vale Mine.

At the Diamond Vale Mine, Merritt, B.C., a tipple is being constructed in order to permit an early resumption of operations. The mine has been idle for some time.

We Make Any Type of Mine Car To Suit You and Your Work

We illustrate herewith one variety of our Rotary Steel Body Cars, to dump any direction. Very simple to operate and perfectly safe. The door is positively locked, and cannot discharge the contents of the car until unlocked and in dumping position.

Our catalogue shows many other types of Cars. Have you a copy?
Let us tender on your Cars, Cages, Buckets, and Hoists. We know we can please you as we have pleased so many others.

Marsh Engineering Works, Limited, Belleville, Ontario
Established 1846
Sales Agents: Mussens Limited, Montreal, Winnipeg, Vancouver

Powdered Fuel More Economical Than Oil?

It is reported that the use of powdered fuel by the B. C. Sugar Refinery, Vancouver, B.C., has proved satisfactory and that, as a result, the Powell River Pulp and Paper Company, and the Ocean Falls Plant of the Pacific Mills, Limited, are likely to adopt the same system. It is said that powdered fuel has been shown to be more economical than oil in this Province, and if the development suggested takes place, there will be established an important additional market for the output of the coal mines of Vancouver Island, Merritt and Princeton.

Delayed Settlements Cause Closing Down of Mine.

Supt. W. G. Norrie-Loewenthal, of the Silver-Standard Mine, in announcing the temporary closing down of his mine, says:

"Our reason for closing down the mine and the mill at this time is purely one of freight rates and the value of Silver Standard ore and concentrates. The railways, chiefly on the American side, where the zinc is shipped, have been altering their rates to such an extent that the smelter people are unable to make a settlement until the rates are adjusted. The matter has been up for two or three months, the Silver Standard people hoping all the time that the rates would be satisfactorily adjusted, and operations continued at the mine. As yet nothing has been accomplished, and it may take another two or three months.

"The position of the Silver Standard is very simple. They have not yet received a dollar for all the zinc concentrates sent to the smelter on the other side, and no chance of getting any until the rates are adjusted, either for what has been shipped or for what is on hand. To continue operations under the circumstances is out of the question.

"As for the mine itself it never was in better shape. There are several shoots of very fine high grade ore recently opened up. Work at both the mine and the mill has been running very satisfactorily. There are on hand a hundred tons of zinc concentrates and 72 tons of lead concentrates."

Mr. R. H. Stewart Will Adjust Taxes.

R. H. Stewart, M.E., of Vancouver, has been appointed by the Provincial Government for the purpose of adjusting the income tax to which the mining companies operating in British Columbia are subjected. He will review the companies' balance sheets from a technical point of view and it is expected that, with his mature experience of operating, he will be able to arrive at equitable settlements in every instance.

"ORTHACLASE" FELDSPAR—I have the finest grade of "Orthaclase" Feldspar and lots of it. Close to railway. Open for orders in any quantities. Car lots preferred.—P. J. DWYER, Wilberforce, Ont.

Mines Shipping Ore to Trail.

The two mines shipping the largest quantities of ore to the Consolidated Mining & Smelting Co's plant at Trail, B. C., during the past year up to the end of November were the War Eagle-Centre Star-Le Roi group at Rossland and the Sullivan mine, owned by the company. The former's total was 88,934 tons, the values being mainly in gold, and the latter's 88,836 tons, of which 82,742 tons supplied the zinc plant of the smelter. Other large shippers were the Emma Mine at Eholt, also owned by the company; the Josie Mine at Rossland with 17,114 tons, No. 1 Mine at Ainsworth, the largest shipper of silver-lead ore outside of the Sullivan with 5,782 tons, the Standard Silver Lead Mining Company at Silverton with 5,658 tons and the Bluebell at Ainsworth with 5,319 tons. There were some shippers from outside the Province among them being the Mandy Mine of Manitoba, which shipped 5,711 tons of high grade copper ore, the Electric Point in Washington which sent 4,563 tons of silver-lead ore, the San Poil at Republic which sent 2,615 tons of siliceous gold ore and the United Copper at Chewelah, which shipped 2,615 tons. Ore receipts at Trail from the various districts of British Columbia are as follows: Rossland, 107,457 tons; East Kootenay, 93,563 tons; Slocan and Ainsworth, 29,303 tons; Boundaty, 19,787 tons; Nelson, 4,246 tons; and American mines, 12,962 tons.

Conditions in Rossland.

Conditions are materially improving in Rossland, one of the most important of the mining centres of British Columbia. This is due to the resumption of operations on a large scale of the mines of the Consolidated Mining & Smelting Company. These are the largest gold producers of the province, their output under normal conditions being three-fifths of the gold produced by British Columbia.

PROVINCE OF ONTARIO
DEPARTMENT OF LANDS FORESTS & MINES
BUREAU OF MINES

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth $72,093,832, of which the metallic production was $56,831,857.

Dividends and bonuses paid to the end of 1917 amounted to $11,486,167.45 for gold mining companies, and $70,821,829.34 for silver mining companies, or a total of $82,307,996.79.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs $5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of $2.50 or $3.00 per acre, depending on location in surveyed or unsurveyed territory.

For list of publications, illustrated reports, geological maps and mining laws, apply to

G. H. FERGUSON,
MINISTER OF LANDS, FORESTS AND MINES,
Toronto, Canada

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $5 an acre for SUPERIOR METALS, and $3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized beltsare known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

CANADIAN BRAKESHOE CO., LIMITED
SHERBROOKE, QUEBEC

EDITORIAL

GRANTING MONOPOLY BY ORDER-IN-COUNCIL.

According to a story emanating from Ottawa, and reaching Toronto by way of Winnipeg and the "Manitoba Free Press," the Dominion Cabinet has had under serious consideration a proposal to grant a monopoly to the Shell Transport and Trading Company, Ltd., to enter upon and develop all the oil-bearing lands in Canada lying in the Province of Aberta. It is announced that a decision by the Cabinet is expected to be reached shortly.

The granting of a monopoly of such a sort to any group of men is itself open to objection. But there is a more serious aspect of the matter. Is it in keeping with democratic ideals that matters of this sort should be dealt with in such a secretive way?

There has been no public discussion as to the merits of this proposal. The Canadian Mining Institute has not yet been asked for its opinion on it. Is it possible that our readers are satisfied to accept the statement of the irresponsible; but evidently inspired writer that "a decision one way or the other may be expected at an early date." Who is responsible for this statement? Where did the Ottawa correspondent of The Free Press get his information? Why do Canadians permit anyone at Ottawa to be in a position to give out such information? Who is attempting to use the Cabinet as an instrument for obtaining special privileges? Why does the Press accept the story as a reasonable one?

The way in which the obviously inspired story has been accepted is an acknowledgement that it is quite possible that such an important matter could be decided by a duly influenced Cabinet and that by an Order-in-Council the decision could be put into effect. This is no time for secrecy in Government actions affecting the development of our country. The Government, if it is seriously considering granting the proposed monopoly, will do well to avoid secrecy.

THE MINING INDUSTRY AND THE WAR.

As a first test as to the value of our mining industry, one may well ask: "Did it help us to win the war?" That it did so will be evident when we consider that we contributed coal, iron, steel, nickel, copper, lead, zinc, aluminum, molybdenite, arsenic, chromite, asbestos, graphite, magnesite, pyrites and many other minerals. Our coal helped to produce power for manufacture of munitions and to propel ships that carried men and munitions across the Atlantic. Our iron and steel was made into millions of shells as well as into countless other forms of war articles. Our nickel was a very important factor during the war, for we produce four-fifths of the world's nickel, which is so greatly in demand for the manufacture of nickel-steel and nickel-chromium-steel. In a smaller way the other minerals and metals mentioned did their part.

It is well to enquire as to the source of these materials, and to consider whether we did as well as we should have done in the great emergency. The matter of coal supply is important to all our citizens. Why is there a shortage? Why has production in Nova Scotia fallen off. Why have the great coal deposits of western Alberta not been more generally utilized in the Prairie Provinces? The coal shortage affects almost everyone, and has helped to direct attention to the fact that we must have coal in war as in peace. When the calls for volunteers came in 1914 and 1915 the enlistment from our coal mining centres was exceptionally heavy. In Nova Scotia there was a rapid decline in number of miners available, and it has been and still is impossible to obtain men with the necessary experience to replace those who went to Belgium and France and fought so valiantly there. In Alberta the situation was quite different. There the mines were equipped and manned for a much larger output than the market demanded. The encouragement by the railways of the shipment of anthracite from the far eastern Pennsylvania fields, made it difficult for Western coal producers to compete in their natural market. When the anthracite supply was cut off there was soon an increase in output of Western coal. In Ontario there was more real danger of shortage, for here we are dependent almost entirely on imports from the United States. It is probable that we will continue to be so dependent. To balance such imports we should endeavor to export more coal from our Eastern and Western coal fields. The high cost of production may, however, make export trade practically impossible. In all parts of the country we should give more attention to the development of water powers for power purposes.

According to the Department of Mines, the total value of the mineral production in Canada during 1918 was probably not less than $220,000,000. The total value of the production in 1917 was $189,646,821. The Department of Mines estimates the production of coal during 1918 at about 15,180,000 short tons, as compared with a production of 14,046,759 short tons during 1917.

The production of the more important metals during

1918 is estimated as follows, viz.: Gold $14,750,000 in value; silver 20,800,000 ounces; copper 117,000,000 pounds; nickel 91,500,000 pounds; Zinc 36,000,000 pounds; pig iron 1,182,000 short tons; steel ingots and castings 1,910,000 short tons. The production of these metals in 1917 was: Gold $15,272,992 in value; silver 22,221,276 ounces; copper 109,227,332 pounds; nickel 82,330,280 pounds; Zinc 29,668,764 pounds; lead 32,576,281 pounds; pig iron 1,170,480 short tons; steel ingots and castings 1,745,734 short tons.

Our large output of iron and steel is not so satisfactory as the statistical tables indicate, for about 90 per cent of this iron was recovered from the treatment of foreign ore. The great iron and steel works of Nova Scotia draw their iron ore from Newfoundland. Most of the iron ore that goes into the furnaces in Central Canada comes from the Lake Superior States. We have deposits in Canada that will yield large quantities of iron ore; but it cannot be said that progress in iron ore mining is satisfactory. It seems probable that in the best interests of the country there will have to be more Government encouragement of the iron industry. The problem will be easily solved if rich large deposits are found, but to develop those that are known, in competition with the richer and more easily worked deposits of the Lake Superior States, is an enterprise that has not proven very alluring to capital.

In the case of nickel we are in a stronger position than any other country. The great mining industry of the Sudbury district are an asset that is hardly appreciated by Canadians. It is well known that the two producing companies are making a large profit on their operations; but there seems to be little recognition of the importance of the industry to the community. It is well to remember that the men employed in the mines and smelting works of the Sudbury district number about 5,000 men. The wages paid annually total over 5,000,000. Machinery and supplies purchased by the companies have cost many millions. In spite of the necessary heavy expenditures, however, the profits have in recent years been very large, and it was not surprising that the company has been called upon to set aside large sums for war taxes.

In Quebec the asbestos mining industry is flourishing, the demand in recent years being exceptionally good. Quebec is the world's chief source of asbestos, and consequently is benefitting by the numerous new uses which are being found for this heat resisting material. The backbone of Quebec mineral production during the war, as pointed out by Mr. Theo. C. Denis, is formed by non-metallic substances—asbestos, mica, magnesite, pyrites for sulphuric acid, and a very varied assortment of structural materials. The prominent part which the latter plays in the mineral production of the province is indicated by the fact that in pre-war times (in 1913) in a total value of a little over $13,000,000 the building materials accounted for 62 per cent, the metallic substance for 3½ per cent, only, the balance (34½ per cent) being made up of non-metallic minerals, such as asbestos, mica, graphite, magnesite. The effect of the war on our mining industry has been most marked, for in 1917 and 1918 the above proportions were greatly altered, and they now stand about as follows: Building materials, 33 per cent; metallic ores, 12 per cent; non-metallic minerals, 55 per cent; the total production of all of which amounted to $16,266,000 in 1917. Figures for 1918 are not yet available, but it is likely that the total value will exceed 17 million dollars.

Great progress is expected to be made this year in the now well established gold mining industry of Northern Ontario. There has been a great demand for gold during the war; but the selling price did not rise with the cost of production, and conditions were becoming such that few gold mines could be profitably operated. In spite of the difficulties encountered, however, progress was made during the war, and a great expansion will soon be possible. There can be little doubt that, for many years gold mines of Northern Ontario will pour out millions of new wealth. Big gold mines employ many men and represent very large investments for plant and development work. The dividends paid do not tell the whole story. Millions are spent annually for labor, supplies, machinery, etc. Around the mines a new community grows and makes a new market for farmers and merchants. Eventually the development of the mines is followed by agricultural development of the surrounding country. Some of the mines will be doubtless worked profitably for many years, and when their end comes the country will have been well tested by settlers who have had unusual transportation facilities and a close market provided by the mining industry. Mines, like railroads, are responsible for much of the agricultural development of our country. It is fortunate for the country that our gold mines lived through the war. The life of the chief producers was not thought to be in danger; but there was every possibility of their being seriously crippled if conditions had become worse instead of better.

One of the most active companies operating in British Columbia is the Consolidated Mining & Smelting Company of Canada. This company is a big producer of gold, copper, lead and zinc. It operates the smelter at Trail. When war broke out the company was not refining its zinc. The company during the war established zinc refining on a large scale, and is also refining some copper. In the face of many difficulties a big plant was built and put into operation. The company thus assisted in overcoming the situation which had been brought about by German control of the zinc market.

Notable progress was made during the war in developing molybdenite, magnesite and chromite deposits in Quebec. As a result we have now the greatest molybdenite mine in America, where when the war started was only an undeveloped prospect. A magnesite industry has been established and a market found for a

considerable quantity of chromite. Great progress has been made in processes of treating these three minerals. We may properly attribute most of this progress to the demand created by the war.

Throughout Canada the war demands stimulated activity in the development of certain minerals. We have little doubt that this stimulation will have permanently good effects.

STATE ADMINISTRATION OF NATURAL RESOURCES.

The question of the rights of the State with reference to the resources within its boundaries has seldom been clearly defined; and in actual practice the legislative control exercised by the State varies widely in the civilized communities of the world. For the sake of simplicity, let us discuss an ideal case, where a state, hitherto unpopulated, but endowed with rich resources, is thrown open to immigrants sufficiently numerous to populate the country and develop its varied resources. Let us suppose also that the outside world clamoured for admission into this new land. It will be granted without much argument that the wise policy for the authorities of such a state to adopt, in order to promote the best interests of the state as a whole, and of the future generations in particular, would be to declare all resources to be the inalienable property of the state, to be leased, under certain restrictions, to individuals or corporations. Under such a system the authorities would always be in a position to exercise supervision over the corporate wealth of the community. They would conserve where necessary in order that the population yet to come would not suffer from the faults of their predecessors. They would prevent exploitation by the promoter with the resources as a pawn in the great game of chance. Such a community would be guided by the principle that the natural resources are, and must always remain, the property of the people as a whole, and not of any individual member of the community; that private initiative and private capital should be given free scope under a long-lease tenure, thereby eliminating the valid objections which may be urged to any system of government operation; that, in order to preserve the rights of the community at large, all such leases should be granted subject to certain conditions of operation, in order on the one hand to ensure satisfactory production, and on the other hand to prevent waste. Such would no doubt be the position taken by any government which had to deal with the situation that we have outlined. And even under present conditions, were enormous resources, such as, for instance, the copper deposits of the Coppermine and neighboring territory in the Arctic Zone, discovered within easy reach of transportation, it is more than probable that the force of public opinion would compel the government, rather than even lease to private corporations, to operate the bonanza directly for the benefit of all the people.

The history of the growth of state communities has, however, been very different from the hyothetical case which we have outlined. Pioneer conditions are hard. Inducements must be offered in order to attract the best type of settler. At the early stage initiative and enterprise are essential, and these qualities are best displayed by the private individual and corporation. In the normal case the agricultural settler is the most desirable immigrant, and there is a deep-rooted desire in the human heart to possess the land on which the seed is sown and the harvest is reaped. For this and other reasons, the door is thrown wide open. Land is sold, given away, or alienated after certain conditions have been fulfilled. Other resources, such as timber, minerals, and even water powers, are handed over in toto; and a state may find itself after a lapse of a few centuries in a position where its revenue depends entirely on the indirect wealth which accumulates through the growth of commerce, and on the taxes collected on the production from resources in the development of which it has lost all control. This is a position to which not a few countries have been reduced; and there is undoubtedly a strong movement to-day towards a return to a general leasing system of natural resources, including even the land itself. Just as in the case of the private industrial corporation, the final bridging of the ever-widening gap between capital and labor may be formed by a carefully administered profit-sharing system, so in the case of the greatest industrial corporation—the state—the people may demand that they shall be more directly than heretofore participants in the profits accruing from the development of the natural wealth of the country in which they live and labor.—R. C. W.

While we have good reason for stating that the mining industry is well established in Canada; that production is increasing steadily and capable men are in charge of most of the operations, we should not be satisfied with the progress we are making. Our mineral resources become valuable only when they are used. Undiscovered ore is of no value, and undeveloped deposits are of little value. We should endeavor to speed up the work of the prospector and assist those who undertake the developing of properties in new districts. Only by the expenditure of labor and capital do mineral deposits become of use. For one prospect that becomes a profitable mine there are many that prove worthless. Those who provide funds for development work recognize that they run a good chance of losing their money. The experienced operators do not expect that many of their ventures will be profitable. They have a right, however, to expect that their successful ventures should prove very profitable. It is the hope of winning one of the rich prizes that leads men to seek mineral wealth in the wilderness. The whole country benefits from their work. It is in the interests of Canadians that development of our mineral resources be speeded up, that prospectors should be encouraged, that the Mines Departments should be authorized to extend their work. More attention should be given by farmers and manufacturers to this matter, with the view to obtaining a larger market in Canada for their products.

Important producing mines of the Slocan District (B. C.), during the past year were the Queen Bess with 2,300 tons and the Galena Farm at Silverton with 1,079 tons.

Coniagas Mine Has Produced Over 26,000,000 oz. Silver

President R. W. Leonard, said in his address at the annual meeting of Coniagas Mines, Ltd.:

During the year ended October 31st, 1918, your mine at Cobalt and your Smelter and Refinery at Thorold (The Coniagas Reduction Co., Ltd.), have been operated continuously and satisfactorily, having in view the difficulties incident to the limited supply of labor and the high cost of materials, which have materially increased the unit costs of your Companies' products. The decreased output and the increase in cost of production have been only partially offset by the enhanced prices received for your products. The average price realized by The Coniagas Mines, Ltd., for Silver sold during the year, was 94.14 cents per ounce, as compared with 79.89 cents per ounce in 1917, and 63.11 cents in 1916.

The output of silver from the mine during the year was 974,264 ounces, as compared with 1,344,267 ounces during the preceding year; and the combined sales of ore from your Mine and the products of your Reduction Company aggregated $4,099,490.

No new discoveries of ore of importance have been made at the Cobalt property, and the future output of the mine depends more than ever on the low-grade ore concentrated in the Mill than on the high-grade ore sacked in the mine. The extent of this low-grade ore is very difficult to determine, but the estimates of Mr. F. D. Reid, Mine Manager, would indicate that a further three years' supply is available, assuming a continuance of present market conditions.

The Coniagas Reduction Company shipped during the year 2,390,737 ounces of Silver, much of which had been taken in at the lower prices prevailing during preceding years, and there are at present over 1,000,000 ounces in process of reduction.

The total shipments of silver from the property to October 31st, 1918, aggregate over 26,000,000 ounces.

The ore has been mined and concentrated during the past year at a net cost of 33.87 cents per ounce, as compared with 21.36 cents per ounce during the previous year. This cost includes all overhead expenses, royalties and other general expenses, but excludes cost of smelting, refining, shipping and marketing, which amount to 7.98 cents per ounce, as compared with 4.31 cents per ounce for the preceding year; and includes a War Profits Tax estimated at $25,332.54. The average cost per ounce of Silver produced during the past 12 years, including all charges above mentioned, has been 16.306 cents.

During the year the following Dividends, amounting to 7½%, were paid:

No. 39—Feb. 2nd, 1918, 2½% $100,000.00
No. 40—May 1st, 1918, 2½% 100,000.00
No. 41—Aug. 1st, 1918, 2½% 100,000.00

and a Dividend of 2½%, with a bonus of 2½%, was declared, payable on Nov. 1st, 1918. These disbursements make a total distribution to the Shareholders to date of $9,240,000.00, of which $7,200,000.00, or 180% of Capital, was paid as Dividends, and $2,040,000.00, or 51%, as Bonuses.

Up to the present time no royalties have been paid to the Minerals Separation Corporation for flotation concentration patents. This Corporation, which claims ownership of these patents, is under investigation by the United States Federal Trade Commission to determine whether they are conducting their operations in the United States on a fair basis.

After making a payment of $30,000 in April last for extension of the option on the Ankerite gold property at South Porcupine, requiring a further very substantial payment, your directors decided to drop the option on this property, but your company still owns three adjoining claims, comprising in all about 120 acres, carrying the extension of the Ankerite ore body.

The consolidation of the Wabi Iron Works, Ltd. (of which your Company owned 6,055 shares at a par value of $1.00), with the Electric Steel & Metals Co. of Welland, and the Boving Hydraulic & Engineering Co., Ltd., of Lindsay, has been effected under the Corporate name of Electric Steel & Engineering, Ltd., and in exchange for shares held in the Wabi Iron Works, Ltd., your company has received 137 shares of Preferred and 137 shares of common stock of a par value of $100, in the new company. A dividend of 3½% was received on the preferred shares on July 1st last.

In view of the substantial cash balance shown in the Financial Statement, your Directors, at a meeting held on October 7th, decided to subscribe, on behalf of the company, for $615,000 of Canadian Victory Loan Bonds, which were purchased in November, making your total holdings of that security $700,000.

Superintendent Fraser D. Reid, in his report, says:

During the year an average of 108 men were employed. The mill ran 93.36 per cent. of possible time.

The tonnage of ore milled was 68,597.0 tons, or an average of 3.38 tons a stamp for 24 hours, as compared with 60,928.8, averaging 3.07 tons per stamp for the previous year. There were 529.51 tons, dry weight, of High Grade Concentrates shipped, and 866.77 tons, dry weight, of Low Grade Slime Concentrates, the former averaging 1164.10 ounces per ton and the latter 244.81 ounces per ton. Mill heads for the year averaged 15.94 ounces per ton as compared with 18.56 ounces per ton for the previous year.

The Cyanide Plant, which had been operating solely on canvas table concentrates and primary mine slime, was shut down on November 20th, 1917. Such action was necessitated by the fact that the vancas tables had been discarded and the Callow Flotation Process had been installed.

The Callow Flotation Plant, to which another unit was added during the year, treated all tailings from the concentrating mill, affecting a material recovery there from. The assay of final tailing, in ounces per ton, was 1.75, as compared with 2.98 ounces for the previous year.

Re-treatment of the sand tailings pile was begun in May, and continued satisfactorily until November, when further operations were curtailed by the non-delivery of machinery necessary to carry on operations during the winter. During this time 21,886.9 tons were treated.

There still remains, stacked on the property, 155,113

tons of sand, tailing of an average value of 3.5 ounces to the ton, and 40,000 tons of slime tailing of an average value of 6.0 ounces to the ton. The total value of sand and slime tailings, in ounces of silver, is 782,895.5.

Development work during the year has been confined to the following of small veins and stringers on all levels and driving numerous crosscuts through unexplored areas.

This work has developed a large tonnage of low grade milling ore. The broken rock on stulls in the mine has been increased 13,825 tons.

A total of 63.22 tons, dry weight, of high grade mine ore, was shipped, which averaged 2,303.7 ounces per ton.

The Coniagas Mines, Limited, was incorporated November, 1906; concentration of ore began September 24th, 1907; mine ore and concentrates shipped and treated together during 1907 and 1908.

Work done to date and work done during the year ending October 31st, 1918:

	Total to Octo. 31st, 1918.	Total to Oct. 31st, 1917.	Work done during 1917-1918
Shaft Sinking, Feet	879	879	....
Drifting, Feet	19,909	18,834	1,075
Crosscutting, Feet	10,678	10,295	383
Winzing, Feet	721	632	89
Raising, Feet	1,538	1,396	142
	33,725	32,036	1,689

	Tons removed since beginning of operations to Oct. 31, 1918.	Tons removed to Oct. 31, 1917.	Tons removed during 1917-18.
Crosscutting	52,124.1	51,624.0	500.1 Waste
Drifting	64.357.5	61,670.0	2,687.5 Ore
Stoping	470,556.5	404,655.0	65,901.5 Ore

Shot Drilling Around Thetford Mines

By J. W. DAVIS.*

Increased activity in mining around Thetford and Coleraine, Quebec, has resulted in considerable prospecting work in asbestos and chromite iron deposits in which Calyx Shot Drills are being used extensively with very satisfactory results.

The formation in this whole district is fractured serpentine and granite, some of the latter being so hard that it will cut glass. The slips run in all directions, and the majority may be described as high angle fractures.

Cut No. 1 illustrates an average core and shows the irregular nature of the seams. Cores taken at several points within a radius of fifteen miles of Thetford have all been drilled in the same broken formation so that it is possible to accurately predict the drilling speed and cost for holes of the same depth, although where granite is not encountered the drilling is faster and the cost lower. However, few holes have been drilled that have entirely missed the granite which is in seams from 1 to 15 feet thick.

The Calyx Drill can use any size bit necessary and by taking out a large core is able to penetrate broken ground and to recover a very large percentage of the material drilled. At Coleraine a total of 209′ of core was recovered from a hole 212′ deep. The ability of the Calyx Drill to extract asbestos cores without losing the fibre is a very important consideration as it is only by visual examination that the extent of the deposit may be determined.

Cut No. 2 illustrates a core in which the vein of crude has not been disturbed. With the diamond drill it was found practically impossible to obtain a core in disseminated chrome ore which is so soft that the core almost invariably crumbled whereas the Calyx Drill takes out perfect cores with a percentage of recovery hitherto unknown. The results have caused a revival in this particular method of prospecting which had been practically abandoned in Thetford and adjacent camps.

Cut No. 3 illustrates a chrome core in which the chromite is plainly visible.

The first shot drilling in the district was done about three miles back of East Broughton with the object of testing out a deposit of Chalco-pyrite in a schist formation. 3″ tools were used taking out a 2″ core but these proved too small as the ground was very badly broken, the core largely consisting of a continuous series of thin discs about an inch thick, which however were recovered. At a depth of about 90 feet the ground be-

*District Sales Manager, Canadian Ingersoll Rand Co., Limited.

came so fractured that the hole finally caved in and the tools were extracted with considerable difficulty. A set of 4½" tools was substituted, the core being 3⅜" diameter and a new hole penetrated the same material making a full recovery without further trouble. In this way 4½" tools were adopted as most suitable for the formation and have since been used on all shot drills in the district. It was demonstrated that in solid rock the large tools did not drill appreciably slower than smaller ones while in fractured material they were essential and satisfactory.

The present high prices and the demand for asbestos and chromite are mainly responsible for the increased activity in shot drilling but several other factors have contributed. Some of the present pits are very deep and hoisting is becoming increasingly difficult and dangerous. In consequence the neighboring ground is being prospected with a view to opening new surface workings. To do away with the present system of cableways and also to enable the miners to work in bad weather underground workings are being opened up on some of the properties and this ground is being thoroughly prospected to determine the location of the best ore and the proper position for main hoisting shafts.

Shot drilling is still being done on half a dozen properties and better records are being made as the operators become more familiar with the formation. However, the following tables and notes are representative of the work done during 1917 and it is our intention to collect further data which will be incorporated into a second article at a later date. All costs cover complete operating charges including moving of drill but do not include interest on investment or depreciation:—

Bennett-Martin Asbestos & Chrome Mines Ltd., Coleraine, Que.

BOREHOLE NO. 1.

Depth, feet	212
Diameter core	3⅜"
Diameter hole	4¾"

11	92	97	71	14	98	70	28	.95	1.30

Average cost, including moving of drill was $1.28 per foot and excluding moving $1.14, 12 shots bits were used in drilling a total of 1,426 feet at an average bit wear cost of .0791 per foot. It was found advisable to keep a number of bits on the job and to square off the ends daily.

At the present time shot drilling is being done by the following operators in the Thetford Camp:

Asbestos Corporation of Canada, Beaver Mine, Thetford Mines, P. Q., Federal Asbestos Company, Robertson, Que., Quebec Asbestos & Chrome Mines, St. Cyr, Quebec, Dominion Mines and Quarries, Black Lake, Que.

Carefully tabulated costs are being kept on all this work and will be published at a later date.

THE IMPERIAL OIL CO.'S INDUSTRIAL RELATIONSHIP PLAN.

Hon. W. J. Hanna Outlines the Scheme.

The spirit which found its noblest expression in the brotherhood of the battlefield has outlived the conflict. It is taking its dominant place in the endeavors of peace. Addressing the gathering of officers and employes of the Imperial Oil Company—the oldest refinery in Canada and the largest in the British Empire—at Sarnia, Hon. W. J. Hanna, the president, outlined the new "industrial relationship plan" which the company has adopted. It was inspired, he frankly stated, by "the lesson of the brotherhood of the battlefield."

"We are feeling our way," said Mr. Hanna, "toward an organization of industry which will reflect and express its essential partnership—which will restore to us the personal touch which, to some extent at least, we lost in what we call our industrial era."

Fifty employes' representatives, elected by ballot by the five thousand men at the works, met the officers of the company with a view to developing greater co-operation and camaraderie, and to discuss the industrial relationship plan, which provides for adjustment of all matters of wages, hours, etc. Mr. Hanna outlined it in his address as follows:

"The agreement governing this new relationship between the company and its employes which is submitted to you provides for conferences between employes' regularly-elected representatives and representatives of the company on the subject of wage adjustments, hours and all matters of mutual interest. It gives to every employe who believes himself to be suffering from unjust treatment or unfair conditions, access through his elected representative to the general superintendent and higher officials of the company, and the right of a conference upon his grievance. It insures the continuance of the policy which has always protected the employe from discrimination on account of membership or non-membership in any church, society, fraternity or union, and it provides other conditions between the company and ourselves which will, we hope, continue and strengthen the harmonious relations which have always existed.

"Our motive in establishing the labor relationship plan with its benefits to employes is not based on philanthropy. We know you better than to suggest philanthropy to you. This plan is purely a policy of business administration to promote continuity of effect and permanence of employment, to the end that replacement changes, one of the most serious menaces to the prosperity of capital and labor alike, is reduced to a minimum.

"On the first day of January we propose that everyone who has served the company for twelve months shall become insured for an amount, depending, of course, on his years of service and his earnings, the minimum being $500 and the maximum $2,000.

"On February 1 we propose to establish old age pensions, so that when a man has reached the age of 65 he can retire, and on his retirement be assured of a reasonable amount to care for himself and family during the rest of his years.

"On the first of March we propose to establish a sick benefit plan by which we can properly care for our men when sickness overtakes them."

Mr. Hanna also announced that all employes who had served as soldiers would be reinstated in the service of the company at no reduction from their former wages or salaries, and adjustments made where necessary to meet the physical condition of any who had suffered disabilities.

Thirteen trades are represented upon the workingmen's committee elected by the thousand employes of the Imperial Oil Company's Sarnia refinery to inaugurate the industrial republic. The conference, at which an agreement was reached providing for the adjudication of matters of wages, hours, living conditions, and the rights of wage earners, marks the first practical application of an industrial relationship plan in any large industry in Canada, and by Jan. 1 it will be extended to cover five large refineries, many marketing stations throughout Canada, the company's fleet, and more than six thousand employes.

Since 1897, when it was incorporated, the company has had no labor troubles, and the agreement reached to-night by the unanimous vote of directors and employes was not in the nature of a truce, but of a treaty based upon 21 years of peace. Henceforth any employe who believes himself to be suffering from unjust treatment or unfair conditions will have the right of appeal to his workingmen's representative, and through him to the higher officials of the company.

The questions as to the remuneration and treatment of labor are to be determined by joint conferences of the company and employes' representatives, and it is provided that at these conferences the number of company representatives voting shall not exceed the number of workingmen representatives having the same right, except for certain specified offences, most of which represent violations of law. No employe is to be dismissed without the right of appeal to a conference for a review of his case, and the agreement sets forth that there is to be no discrimination against any employe on account of membership in any union, fraternity or other organization.—Hamilton Spectator.

MILLER INDEPENDENCE.

Boston Creek, January 2.

The by-law authorizing the increase of the capital of the Miller Independence Mines from 500,000 to 700,000 shares has been passed unanimously. Upwards of 400,000 of the 500,000 shares of the issued capital was represented at the meeting. W. E. Simpson, who, together with Frank Groch of Cobalt, is consulting engineer for the company, arrived here early this week for the purpose of thoroughly sampling the mine. It is planned to survey and sample the entire surface and underground workings. This work is preliminary to the actual beginning of the big development programme now proposed and for which the increase in capital has been authorized.

MINING IN CARIBOO DISTRICT.

Discussing the season's mining operations in the Cariboo District, B.C., Henry Boursin, a well-known mining man, makes the following statements:

"The output from the hydraulic mines this year was less than that of last year, owing to a shorter water season and scarcity of labor, although the clean-up of the Stout's Gulch Mine was more than usual, due to the discovery of another channel of pay gravel. Stout's Gulch is a small stream just above Barkerville, B.C. The yield of gold from the Gulch, first by drifting and later by hydraulic, amounts to $2,500,000. The width of hydraulic pay (more than 600 feet) is extraordinary for such a small stream.

"C. W. Moore, acting for American capitalists, has bought the locally owned Waverly Hydraulic Mine on Grouse Creek, four miles from Barkerville. Although the Waverly is one of the oldest hydraulic properties in the Province, it doubtless contains more gold than has been washed out of it, as the head of the sluice flume is 30 feet above the bottom of the pay gravel in the main channel, and the gravel below the flume is known to be rich.

"F. J. Tregillus, T. A. Blair and Pat Carey are sinking a shaft on the nine-foot gold-bearing vein on their Warspite Claim four miles from Barkerville. At the present depth, 14 feet, the shaft discloses an excellent showing of visible gold, while the rock in which no gold can be seen shows a nice string of flour-gold when mortared and panned. The vein on which this work is being done has been exposed at intervals by trenching, and open cuts a length of more than 8,000 feet, and is believed to be the motherlode from which the $20,000,000 placer of Williams Creek and the $2,500,000 placer of Grouse Creek have their origin.

"The creeks mentioned drain the western and eastern slopes respectively of the Proserpine Mountain, and the strike of the vein closely approximates the up-stream limit of rich placer on each creek.

"The Lightning Creek Gold Gravels company is drilling with a Keystone on Lightning at Wingdam. This company was promoted by C. H. Unverzaght, of New York, and last summer an agent of the United States Government was sent to the property to see how conditions tallied with advertisements.

THE GREENWOOD SMELTER PROBLEM.

The closing down of the Greenwood, B. C., Smelter by the Canada Copper Corporation has stirred the residents of that district to action. They do not propose allowing the plant to remain idle if anything they can do can prevent it. Hon. J. D. MacLean, Minister of Education in the Provincial Government and the member for the section particularly affected, visited his constituency recently and interviewed the management of the company to ascertain whether some arrangement could not be made for the re-opening of the smelter. His efforts, however, were without avail, although he is understood to have volunteered to use his influence with the Government to endeavor to obtain financial assistance. The citizens will not accept a negative, following up Dr. MacLean's unsuccessful intervention with a mass meeting in order to obtain the united financial and moral backing of residents. They appointed Mr. Oscar Lachmund, former manager of the Canada Copper Corporation, to take charge of negotiations with the company officials and advanced three alternative propositions. One is that a sufficient ore supply be sought to keep the plant in operation and the Canada Copper Corporation again be asked to continue. Another is for an independent company to lease the plant and pay royalty to the company for ore from their mines. The third is that the Town of Greenwood buy the smelter, build a lead stack, and operate with copper, lead and silver ores from both sides of the international boundary.

U. S. Mineral Output in 1918 Valued at $5,160,000,000

Preliminary estimates of the U. S. Geological Survey show that the output of metallic products, chief of which are pig iron, copper, ferro-alloys, lead, zinc, gold, silver, and aluminum, was valued at over $1,895,000,000 in 1918, against $2,091,825,000 in 1917, and that the non-metallic products, principal of which are coal, petroleum, clay products, cement, and natural gas, were valued at over $3,265,000,000 in 1918, against about $2,889,000,000 in 1917. The total for 1918, including unspecified products, is roughly estimated by the Survey at $5,160,000,000, a good increase over the total of nearly $5,011,000,000 for 1917, and a vast increase over $3,513,972,000 for 1916.

Copper.

The production of copper in the U. S. in 1918 was slightly larger than in 1917, according to preliminary figures and estimates collected by B. S. Butler, of the United States Geological Survey, Department of the Interior, from all plants that make blister copper from domestic ores or that produce refined copper. At an average price of about 24.75 cents a pound, the output for 1918 has a value of $473,000,000, as against values of $510,000,000 for 1917, and $190,000,000 for 1913.

Lead and Zinc.

The domestic mine output of lead and zinc decreased in 1918, according to C. E. Siebenthal, in a statement just issued by the U. S. Geological Survey, Department of the Interior. The lead and the recoverable zinc of ores mined was approximately 563,000 tons and 627,000 tons, as compared with 651,156 tons and 711,192 tons in 1917. The refined lead output of smelters and refineries was 645,000 tons, against 612,214 tons in 1917, and the antimonlia lead output was 22,000 tons, as against 18,647 tons. The lead available in the United States is 540,000 tons, against 515,258 tons in 1917. The output of spelter from domestic and foreign ore was 525,600 tons, compared with 669,573 tons in 1917. Spelter from foreign ore decreased to 23,300 tons from 84,976 tons in 1917. The apparent domestic consumption of spelter was 440,000 tons, compared with 413,984 tons in 1917. The consumption figures of both lead and zinc include the metal shipped abroad for use of the American Expeditionary Forces. The average price of lead at New York was 7.6 cents a pound, and of spelter at St. Louis, 8 cents a pound.

Oil.

The quantity of petroleum marketed from oil wells and field storage tanks in the United States in 1918 amounted to 345,500,000 barrels, an apparent gain of 3 per cent. over the former record output of 335,315,601 barrels, established in 1917. The output in 1918 includes no less than 6,500,000 barrels of crude oil removed from field storage during the year. The surface reserve of crude oil held by oil producers and pipe-line companies in the United States at the end of 1918 is estimated at 123,000,000 barrels, compared with 150,000,000 barrels at the end of 1917.

Special Correspondence

NORTHERN ONTARIO.

More Miners Now at Cobalt.

"Oceans of labor," such was the unhesitating reply of a leading mine manager in Cobalt recently when interviewed as to the labor situation in the Cobalt camp. In the Cobalt mines a shortage of ten per cent in the working forces of the various properties existed about two months ago, while to-day the supply of labor is satisfactory. With the price of silver high, the mines of the Cobalt district are producing silver at a good margin of profit from ore that recently as two years ago was unprofitable to handle. Thus the ore reserves of the producing mines have been added to a large extent and the life of the camp lengthened thereby. The present year promises to be one of exceptional prosperity for the silver mining industry, and Cobalt, which has occupied such an important place in the world's output of the white metal for a number of years, will retain a very high place in the list of districts producing silver. With the slackening of production in a number of the world's largest copper mines from which a good deal of silver has been produced, the demand for Cobalt's silver should increase. Thus, the outlook for the white metal during the current year is very bright and the Cobalt district will benefit greatly thereby.

Pittsburg-Lorrain Mine Closed Down.

The Pittsburg-Lorrain mine in the South Lorrain section of the Cobalt camp has closed down. The work at this property had been carried on consistently and aggressively by private interests of Pittsburg for the past two years with varying results, the operation representing a most earnest endeavor at mine making. The syndicate, in addition to owning and operating the old Currie property, also operated the mine and mill of the Wettlaufer Silver Mines under lease. All work was recently discontinued, after the shipment of two carloads of ore, from the property.

The Flotation Prices.

The Federal Trade Commission of the United States recently commenced proceedings against the Minerals Separation North American Corporation, which concern claims the patent rights to the oil flotation process for the treatment of ore. The charge is under the terms of its organic act, with the administration of a simple, just and inclusive pronouncement of laws—"Unfair methods of competition in commerce are hereby declared unlawful."

The action of the American Federal Trade Commission will give general satisfaction to mining companies using the oil flotation process in the Cobalt camp. The Minerals Separation Corporation has so framed its agreement or contract that mining companies would always have to pay a toll to it if the Federal Commission had not come to their rescue. It is hoped that the Commission will come to a just and conclusive decision, and that this process, by which 30,000,000 tons of ore annually are treated in Canada and the United States, will be properly governed.

Paragon-Hitchcock.

A narrow vein, carrying high silver values is reported to have been discovered on the Paragon-Hitchcock property at Elk Lake. The vein is about one inch in width and was encountered at the 100-foot level.

Device to Hold and Turn Steel.

Mr. Duncan McKinley, a miner of Elk Lake has secured a machine which is said to do work of one man in working with hand steel. The little machine, which is very compact, holds and turns the drill after each stroke, so that the hammerman is all that is required to drill with hand steel. A number of practical miners have tried the invention here and give it great praise.

Increasing Working Force at Adanac.

Owing to favorable developments at the Adanac mine it has been decided to add to the working forces at the property and also to increase the number of machines employed. This announcement was officially given out recently. During the past year the Adanac has been operated aggressively, something like 1,000 ft. of underground work being done. It was not until recent months that the work reached the point recommended by Alfred R. Whitman for extensive development. A crosscut has been run to the west of the long drift at the 310 ft. level of the property, during the course of which work a number of important developments took place a series of veins containing silver values being encountered. The main vein of this series has been drifted on for a considerable distance and a considerable amount of good grade ore has been developed. The decision of the company to increase the working forces at the mine, and the recent announcement that shipments would be made regularly to one of the customs mills of the camp, indicate that the operation of the property is meeting with a good deal of success.

McKinley Cuts New High Grade Silver Vein.

A new high grade vein was cut this week at the 300 ft. level of the McKinley-Darragh-Savage mines at Cobalt. The find was made in the western half of the property where a considerable area of virgin ground remains to be explored. So far several rounds of shots have been taken off the vein, which has been found to maintain a width of from one to two inches, some of the ore running as high as four thousand ounces to the ton, while the average grade is high. Besides the rich high grade streak the wall rock on either side is well shot through with leaf silver, and a considerable tonnage of low grade ore is being opened up. The finding of low grade ore in the wall rock at the McKinley is quite the usual occurrence. The low grade ore sometimes proves ultimately of more value and a more lasting source of revenue than the limited shoots of high grade.

A recent financial statement of the company showed its financial position to be fairly strong, aggregating $350,169, made up as follows: Cash on hand, $196,034; ore in transit and in smelter, $105,500; ore at the mine ready for shipment, $48,535. The McKinley-Darragh's new oil flotation mill has been working on sands and slimes from the bed of Cobalt lake for the past summer and has added to the revenue of the company about $8,000 per month from this source. This oil flotation mill has closed down for the winter, but operations will be resumed in the spring on an enlarged scale a new large pump being installed for the quicker handling of the material to the mill. While it is early yet to pass an opinion on the new vein cut in the western section of the property this week, the indications are that an orebody of considerable importance might be developed.

Crown Reserve's New Vein Shows Up Well.

The new rich vein recently discovered at the 200 ft. level of the Crown Reserve Mine continues to show up well under development. For a distance of one hundred feet the vein has shown a width of from about three inches on an average, and contains average silver values of about three thousand ounces to the ton. The vein occurs in conglomerate formation and the geological conditions are such as to point to the likelihood of the deposit being of extreme importance. A considerable amount of ore has already been opened up and will add considerably to the revenue of the company. One of the most important features in connection with the development on the eastern section of the property where the vein was encountered, is that the eastern section of the property is practically virgin territory, with favorable geological conditions existing. This fact presents big possibilities. The exact depth of the conglomerate formation has not yet been ascertained, but it has been proven to continue to at least a depth of 35 ft. below the 200 ft. level. The discovery of this vein, coupled with the further development of the ore shoot, marks the discovery as one of the most important recorded in the Cobalt camp in several months.

The annual meeting of the Crown Reserve Mining Company will be held in Montreal on the 22nd of the current month. The company owns a large amount of the stock of the Porcupine Crown Mines and no doubt some definite announcement of the further operation of this mine will be forthcoming at the meeting, and the recent developments at the company's Cobalt property should prove a source of much satisfaction to the shareholders.

Cobalt's Big Silver Producers.

The Nipissing, Mining Corporation of Canada and the Kerr Lake Mines were the leading producers of silver in the Cobalt camp during the past year. The year was not marked by any sensational developments, but rather a very high, consistent rate of production was maintained. The Nipissing and Mining Corporation of Canada produced somewhere around four million ounces each during the year, while the Kerr Lake produced around two and a half million ounces. The O'Brien Mining Company is the only other Cobalt producer which exceeded the million ounce production. The Coniagas mine, which has maintained a production of upwards of a million ounces for the past eleven years, this year fell below the million ounce mark by about twenty-four thousand ounces. The Nipissing with its large acreage of virgin ground has added a number of high grade silver veins to the large number previously known. A more or less comprehensive plan of development is now being carried out at this leading Cobalt property, in addition to which normal production is being maintained. This extension of development plans may reasonably be expected to result in the discovery of other important ore bodies. During the past year the Nipissing mine has taken the position formerly occupied by the Mining Corporation of Canada as the largest silver producer in the British Empire, and there is every reason to look forward to this enviable position being maintained by the company for many years to come.

Bailey-Cobalt.

The shareholders of the Bailey-Cobalt Mines are being asked to sanction the sale of the property to a new company known as the Bailey-Northern Customs, Limited, with a capitalization of one and a quarter million dollars. The proposed plan is that the liquidators sell to the new company the Bailey mine with all its assets for 425,000 shares of the stock in the new company, which will enable the liquidators to distribute one share of new stock for every ten shares of Bailey stock now held by the shareholders. The new company would then purchase the assets of the Northern Customs Concentrator Company which owns a large mill located in the Cobalt camp, which is understood to have cost upwards of $300,000 to erect. This mill at the present time is said to have contracts for treating ores from the LaRose Mines, Foster Mine, Right of Way and Green Meehan mine, and has other contracts under negotiation. The recent circular sent to the shareholders states that the mill is capable of earning $91,250 yearly from its custom mill operation alone. The new company, besides owning the Bailey mine and this large customs mill has made provision to have $50,000 in the treasury for working capital. The proposed plan also provides for the payment of all claims of the liquidators shall be settled and the new venture started out free of debt and with $50,000 in the treasury. As soon as the new proposal is ratified by the shareholders the new company propose to start work and commence mining operations.

Any solution of the troubles of the Bailey-Cobalt Mining Company will no doubt prove a source of gratification to the many shareholders who have long since ceased to think of the concern as a live issue owing to the long-drawn out litigation proceedings.

Want Government to Open Remainder of Gillies Limits.

The Ontario Government is to be asked in the near future to throw open the remainder of Gillies' Limits for mining purposes. The Boards of Trade of the North Country will perhaps be asked to co-operate with this end in view. A few years ago the section of the limits immediately adjoining the Cobalt camp were thrown open, but nothing of much importance has so far been discovered in this territory as the section thrown open did not include any of the area in which the conditions were favorable to the finding of silver deposits. If the restriction on Gillies' Limits could be removed, a large field would be open to prospectors, and the probability is that discoveries of much importance would be made. In the meantime those prospecting in the Limits would naturally make Cobalt or Haileybury their headquarters, and in various ways the increased activities would be beneficial to many towns in the North. It is anticipated that there will be a surplus of labor during the coming summer and early fall of 1919, and a large number of men would find profitable employment in the opening up and prospecting of this promising area which at the present time is being reserved for timbering purposes.

The Plenaurum.

Various opinions are expressed throughout the North country by mining men regarding the extension granted the McIntyre mining company of Porcupine on the Plenaurum property. It is stated that the reason for requesting an extension of time on this property, is the fact that it was physically impossible for the company to secure adequate working forces with which to carry out the proposed exploration program during the past year. While this is true, the extension of one year appears to have left the impression that nothing of big importance has so far been encountered on the property. The opinion in the camp appears to be that had the McIntyre opened up ore-

bodies of importance it would scarcely have been possible to secure an extension in view of the exceedingly reasonable terms governing the former option on which the present year's extension is based.

On the McIntyre mine itself, development work continues to be exceedingly favorable and the mine holders, unchallenged for the present, the enviable position of the second largest gold producing mine in the Dominion.

Porcupine Crown.

It is highly probable that the Porcupine Crown Mines will resume operations in the near future. The mine has been kept pumped out and the milling plant is in an excellent state of repair. Enough high grade ore for six months' operations is broken on the stulls in the mine ready for hoisting to the mill. The treasury of the company contains something like a quarter of a million dollars and, with scores of men coming to the Porcupine camp every week looking for employment, the time is considered opportune for the Porcupine Crown to soon commence operations at full blast. The ore reserves already blocked out at the property are sufficient to keep the mill operating at capacity for a period of two years. Previous to closing down, the company was on a dividend paying basis of 12 per cent annually, and it is anticipated these disbursements could soon be resumed after operations are again commenced at the mine.

BRITISH COLUMBIA.

100 Ton Mill for Bowena Copper.

The Bowena Copper company, whose property is situated on Howe Sound, British Columbia, is constructing a concentrating mill, with a daily capacity of 100 tons. The plant is being installed by Messrs. T. A. Walsh & Co., Ltd., of Vancouver, B.C.

Developing Galena at Lanark Mine.

Another strike is reported on the mine of the Lanark property, Illecillewaet, B.C., two to three feet of solid galena being reported to have been developed in No. 2 tunnel. This mine looks more promising as development continues, several first class bodies of ore having been blocked out in the course of the last few months. A meeting of the stockholders will be held on the 5th of January at Yakima, Wn., for which point Mr. W. B. Dornberg, the manager, left some days ago.

Rambler-Cariboo.

The Rambler-Cariboo Mines Company, according to estimates of its president, Mr. A. F. McClaine, has made a profit of $20,000 during the current year. Gross returns were $80,000. No dividends will be declared this year, but the profits have increased the company's surplus to approximately $50,000. This property is situated in the Slocan District, British Columbia.

Duncan River District.

The British Columbia Government proposes opening up the Duncan River District, which is highly mineralized, by the granting of financial assistance for the construction of a wagon road. The minerals of the section, which has been handicapped in its development because of lack of transportation facilities, include gold, silver, copper, lead and zinc which occur under promising conditions.

WAR WORK OF THE U. S. BUREAU OF MINES.

Washington, December 18.

How a great governmental agency engaged in saving the lives of miners and promoting the welfare of the industry, at the call to arms was instantly turned into an engine of death and destruction to enemies, is detailed in the annual report of the U. S. Bureau of Mines, Department of the Interior, by Van H. Manning, the Director.

The report, which closes with the fiscal year June 30, while the United States was still at war, tells of the strenuous part played by the Bureau of Mines in assisting to build up the terrifying machine of death that would not have been felt with its fullest force by the Hun until the following spring.

At the same time great good for the future peaceful pursuit of industry in this country and for the saving instead of killing of men has come out of this welter of death-dealing experiments, is the claim of the Bureau of Mines. Certain experiments with delicate instruments known as microphones and geophones, in order to detect the direction and the distance of enemy mining work in tunnelling and the location of enemy artillery no matter where placed, has disclosed that these same instruments can be of use in determining the location of men entombed in mines following disaster. It is expected that, if the men have the presence of mind to make even a slight noise, the rescuers listening with these devices will be able at once to locate the men and begin the rescue work. Men thus entombed have been known to live for a week or longer under such circumstances, the rescuers being unable to find them. Other men have died before they could be located. The bureau will equip its rescue cars as soon as possible with these devices.

The war experience of the bureau is going to help peace industries in still another direction. The coal experts, eager to do their share in winning the war, were assigned to the testing of boilers to be used in the ships of the Emergency Fleet Corporation. Speed, and the saving of coal were demanded. The result was that the experts so changed the design of the boilers that the coal heretofore necessary to send the ships along for six miles was sufficient to carry them seven miles. This great saving will be available in peace times.

Early in the war every experiment station of the bureau in the mining districts of the country at once closed its peace activities and marshalled for war. The entire bureau and its men and equipment were offered to the two war services. Especially pressing scientific problems were allotted to the different stations, and where the bureau did not have all the men necessary, it turned over its laboratories and equipment to the men assigned by the War and Navy Departments. In this way a central-control laboratory for the testing of materials of war was established at the Pittsburgh station of the bureau by the Ordnance Department. Steel for cannon, material for cartridges and other materials used by the Ordnance were here tested for flaws and weaknesses. The War Department was determined that no soldier, in the emergency of battle, would be able to say that his gun failed him because of faulty material.

The War Department next seized upon the opportunity of using the bureau's explosives station and bomb-proof a few miles from Pittsburgh, and there many important, yet secret tests into the action of new and deadly explosives, were made under the supervision of the bureau's and armies' experts. Information of the greatest importance to the war-making powers was obtained.

Early in February, 1917, when war between the United States and the Central Powers seemed inevitable, the bureau offered its services in the study of poisonous gases and gas-masks to the War Department, which was

accepted. This was the beginning of the great organization of 1,700 chemists who constituted the Chemical Warfare Service at the American University at Washington and whose jurisdiction was afterwards turned over to the War Department. The bureau claims that as a result of its work, the United States was months ahead of where it otherwise would have been, and the soldiers all had gas-masks of such quality that the War Department some time ago issued a statement to the effect that the gassing of a soldier was to be considered in the future as a matter of ignorance. Still further it is claimed by the bureau that through the energy of its research organization, the large-scale production of toxic gases was far ahead of the supply of shells.

The Ore Dressing Laboratory of the Haileybury School of Mines

By J. A. McRAE.

The ore dressing laboratory of the Haileybury School of mines is completed, and last week the plant was subjected to a trial run. The services of Douglas A. Mutch, formerly manager of the Temiskaming & Hudson Bay Mines, and now connected with the Coniagas mines, have been engaged, and the next few weeks will be spent in tuning up the plant preparatory to regular utilization as a demonstration plant for the benefit of pupils, as well as for affording to the mine operator of the whole of this part of Northern Ontario facilities for developing a process for treating ore peculiar to their mine and under their own supervision. The formal opening will probably not take place until some time in February.

The members of the school board include some of the leading mining men and metallurgists in the Dominion. In this respect the school has been exceptionally fortunate. These men have given freely of their services, believing that in doing so they have performed a patriotic duty to the country, and have religiously adhered to the principle of doing their best for the mining industry. This is the chief aim of all able mining men who follow the great and fascinating business of mining to a point where achievement gives greater satisfaction than does salary or position.

Mr. F. D. Reid, manager of the Coniagas Mines, Cobalt, is chairman of the school board, the other members being J. J. Denny, manager of the Research Department at the Nipissing Mine, M. F. Fairlie, manager of the Mining Corporation of Canada, and E. A. Collins, formerly mining inspector for this district.

Equipment

The mill with which the Haileybury Mining School is equipped marks the highest point towards which the world's metallurgists have attained. The plant and machinery designed and installed by men who have attained to the heighth of the profession of mining and metallurgy, is among the most modern and flexible ever constructed. The plant was designed with the object in view of providing a plant suitable for treating ore by amalgamation, gravity concentration, flotation, using a single process, or using the various processes in any desired combination. The flexibility of the plant, therefore, makes it possible to duplicate the work of the various mills in operation throughout the district, or offers wide scope in conducting original tests. The following is a brief summary of a part of the tests and combination of tests possible to carry out in the plant:—

1st. Straight gravity concentration test, by crushing to the desired size in stamp battery and tube mill and concentrating the crushed product on jigs and concentrating tables.

2nd. Concentration followed by cyanidation.

3rd. Straight cyanidation, in which provision is made for all sliming and agitating process, or leaching the sand and agitating the slime. Provision is made to precipitate values from the pregment solution by sodium sulphide, zinc-dust, or aluminum dust.

5th. Amalgamation followed by concentration.

6th. Amalgamation followed by cyanidation.

7th. Amalgamation followed by a combination of concentration, cyanidation or flotation.

The equipment consists of a small jaw-crusher, a battery of three light stamps, amalgamation plate, classifiers, tube mill, concentrating tables, agitators, thickeners, and flotation machine. The building of which the plant takes up the first story is 65 ft. by 35 ft. and is of brick.

The upper floor of the same building contains a carpenter shop, analytical laboratory, machine shop and blacksmith shop. The assay office is on the first floor.

From the interest being manifested on every hand it appears to be quite evident the entire North Country will take advantage of the opportunity the institution offers the boys of High School standing, as well as the course for mill-men, miners, prospectors and others engaged in mining work. That in various ways the cost and the effort expended will be returned in multiplied form is not doubted in view of the fact that the school is situated in such close proximity to the silver mines of Cobalt and the gold mines of Porcupine, Kirkland and Boston Creek, as well as the silver mining camp of Gowganda and other outlying mining districts.

It is considered fitted that leading mining men of Cobalt (the first real precious mining camp to be developed in the province of Ontario) should have placed such an important part in establishing such a school in its sister town. Also, the town of Haileybury is considered fortunate for having been chosen as the most suitable location for such an institution. A number of Haileybury's oldest residents, outstanding among which is License Commissioner George T. Smith, together with W. A. Wilson, principal of the school, first voiced the idea of establishing a mining school in Haileybury. The suggestion found early support from all parts of the district, and particularly from the Cobalt district.

How To Begin.

In establishing a mining school, many factors must be taken into account. First is the demand for such an institution. Second is the expense. Third is the choosing of a suitable location; and, fourth, is being able to enlist the services of competent mining men and metallurgists for its designing and construction.

In this district the demand was great. The favorable effect it should have in the matter of increasing the standard of skilled labor at the mine should be almost immediately felt. Already the services of boys with course as yet not completed are being sought for by the mines of the district. As for the location, it is within five miles of the heart of the great Cobalt silver camp, and almost on the southern fringe of the great gold zone which includes the already proven camps of Porcupine, Kirkland Lake and Boston Creek, as well as the great sweep of country in which rock formations are such as to point toward the likelihood of the discovery of other large precious metal camps. As for being able to enlist the services of efficient mining men and metallurgists, the Haileybury School of Mines has been exceedingly fortunate, as already stated. Also, concerning the matter of financing, the way has been made easier than that which might fall to the lot of another such project were an attempt to be made at its duplication in other districts. Of course, provided the demand is sufficiently great for such an institution, and provided it can be shown that the enterprise will undoubtedly be carried through successfully it is quite reasonable that limited financial assistance from the government should be forthcoming, for a time at least. However, more than this is necessary. For instance, the Haileybury School and equipment cost upwards of $30,000. The great majority of the machinery was donated by mines, manufacturing concerns and private individuals. Had it been necessary to purchase this equipment, pay for the services of leading mining men and metallurgists in order to attain the present high degree of perfection, the cost might reasonably prove too heavy for the average community to undertake, and might, therefore, result in the finished plant falling far below the desired standard. It can therefore be seen that the first consideration before undertaking such a task is to have the unremitting support of the leading mining men of the district for which the school is being planned to serve, as well as the entire community. Unless the successful completion of the plan outlined can be clearly seen it would be dangerous to make a beginning. After following the trend of progress made since the commencement of the Haileybury School of Mines the foregoing deductions come to mind. Should they prove to be of value to any other community in which such an institution desires the advantages offered by a modern flexible milling plant, they will have served their purpose.

MAY ENLARGE TRAIL COPPER REFINERY.

The management of the Consolidated Mining & Smelting Co. of Canada has made a reassuring statement with respect to the future demand for metals and the general effect of the termination of the war on the mining and smelting industry, which is the backbone of the Eastern section of British Columbia. At present the Trail Reduction Works are working on an order for spelter; but the outlook for orders for copper and lead are not, as yet, bright. Silver and gold, of course, take care of themselves. It is stated to be the intention of the Consolidated Company to continue operations on the present basis as long as possible, and more or less extensive plans have been made for keeping practically the normal force of men at work on construction or development. The Consolidated Company, now that the Canada Copper Corporation is stopping work definitely at its smelter at Greenwood, B. C., will handle the concentrates produced by its mill at Princeton, B. C., which is expected to be running next year. Should the situation develop as indicated, the enlargement of the Trail copper refinery to practically three times its present capacity —it being now 20-tons daily—will become necessary. This would mean considerable construction work and probably some changes to the copper furnaces and converters. Then, with the greater demand for gold and a less cost for supplies probably at no distant date, the tonnage to be taken from the Rossland gold-copper mines of the company should be materially increased. Gold mining, it is thought, with more staple conditions prevailing, will become more popular.

THE GIBBS BREATHING APPARATUS.

Self-contained breathing or rescue apparatus is a device by which man is enabled to do work in places where he is by nature unfitted to go or live. Breathing apparatus of the self-contained type was first introduced into this country in 1907, following which various types of apparatus manufactured in England and in Germany were installed at the mines and industrial plants of Canada and the United States.

Until 1912 no effort was made to develop an American made apparatus. Investigations conducted by the United States Bureau of Mines demonstrated very forcibly that there was much room for improvement in the various types of European made apparatus, and work was commenced by the various engineers, physiologists and chemists of the Bureau of Mines for the development of an improved type of oxygen breathing apparatus.

The **Gibbs Oxygen Breathing Apparatus** developed by W. E. Gibbs of the U. S. Bureau of Mines, Department of the Interior, is the result of six years study, research and experimental work by these experts. Early in the year 1918 the manufacture of the Gibbs Apparatus was begun at the plant of the Edison Phonograph Works, Orange, N.J.

General Requirements of Breathing Apparatus.

In order to be safe and efficient, self contained breathing apparatus, whatever its type or the details of its construction, must comply with certain basic requirements. These requirements have been outlined by experts as follows:

(1) An oxygen supply adequate alike to conditions of rest and violent exertion, and capable of being adjusted to last as long as possible, in case the wearer should happen to be imprisoned in bad air by a fall of rock or other cause.

(2) Such efficient absorption of the carbon dioxide exhaled that the wearer, even during vigorous exertion and hard breathing is not compelled to reinhale enough carbon dioxide to appreciably interfere with his capacity for exertion. One per cent should be the maximum, and less than half of one per cent the aim. The absorber should be able to take up an amount of carbon dioxide corresponding approximately to the total oxygen supply carried.

(3) Freedom from mechanical obstruction in the apparatus, so that the wearer may inspire and expire even during the most violent breathing without noticeable impediment; no negative pressure at any time,

LINK-BELT SILENT CHAIN

TRANSMITS POWER WITHOUT SLIP OR LOSS

Every turn of the motor pinion produces a corresponding turn in the driven wheel. Link-Belt Silent Chain is "Flexible as a Belt—Positive as a Gear—More Efficient than Either" under all load and atmospheric conditions—the ideal drive for the grueling conditions that cement manufacture involves.

The flexibility of Link-Belt Silent Chain protects the motor against the shocks of starting and sudden overloads; the positive drive assures uniform, regular operation.

Write for Data Book No. 125, our 128-page pricelist. It tells all about Silent Chain Drives, showing how to figure them, and to determine prices.

CANADIAN LINK-BELT CO.
LIMITED

MINE CAGES

We make this or any other type of Mine Cage to order to fit the customer's shaft. We make them strong and substantial, and provide them with a proper Safety Device to prevent the cage falling in case of accident.

May we quote you on yours?

We also make a large assortment of

Mine Hoists, Mine Cars, Mine Buckets, Boilers, Tanks, Etc.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **Belleville, Ontario**

Sales Agents: MUSSENS, LIMITED, Montreal, Winnipeg and Vancouver

as poisonous gases are liable to be drawn in; and a positive pressure at the mouthpiece of not more than 2 inches water gauge even during the most forcible expiration.

(4) Arrangements to obviate the danger of the breathing bag or bellows being breathed or squeezed empty when the wearer is crawling in a low passage, as he is then unable to inflate his lungs and may throw off the apparatus.

(6) Tightness of the apparatus so that not even the smallest quantity of the poisonous gases by which the wearer may be surrounded can be drawn into the apparatus and so reach his lungs, the apparatus to be as nearly accident proof and "fool proof" in this respect as possible.

(6) The avoidance of an excessively high temperature—as produced by the absorbers now in use—and efficient heat radiation.

(7) Simplicity of construction and such arrangements as will effectually protect the vital parts from breakage by striking against walls or roof or from the wearer's happening to fall.

The Gibbs apparatus was designed along the lines indicated in these general requirements and it is conceded by experts as having successfully filled the specifications.

CANADIAN MINING JOURNAL IS NOW A WEEKLY.

Beginning with the Jan. 8th number the Canadian Mining Journal is to be published weekly. With an enlarged staff and more frequent publication we will be able to give the mining industry better service. There have been some unavoidable delays in publishing the first two numbers, and some unsatisfactory productions owing to our new printing plant at Ste. Annes having to turn out work before the builders were quite through with construction. We can assure our readers that we will soon be publishing a much improved journal, with many more contributors. News from the mining districts will be published more promptly and there will also be more technical articles of interest to those who are operating mines and metallurgical works.

We are Manufacturers of

"ORTHACLASE" FELDSPAR—I have the finest grade of "Orthaclase" Feldspar and lots of it. Close to railway. Open for orders in any quantities. Car lots preferred.—P. J. DWYER, Wilberforce, Ont.

FOR SALE

1 4x8 Marathon Mill, with 7 tons of grinding rods from 5/8 to 1¼ in. diameter, and 7 tons extra 1¼ in. rods. The delivery of this mill was too late for the purpose for which it was bought, so it has not been used.

1 12-in. x 15-in. two-drum Jenckes Tandem Hoist, with one 20-in. auxiliary drum and one nigger-head mounted on the shaft extension. Second-hand, but in good condition.

1 Steel Mast, 11 x 17 inches, 45 or 60 feet long, equipped with all sheaves, foot castings and swivel top piece for 12 guy wires.

1 1 cu. yard Mansfield back dump Excavator Bucket, second hand.

McKinley-Darragh-Savage Mines Limited

COBALT, :: ONTARIO

THE ENGINEER AND THE CANADIAN MINING INSTITUTE.

In this issue we publish another letter on the character of the Canadian Mining Institute and the Engineering Institute of Canada. In this letter, Mr. J. A. Reid agrees with us that the former represents the mining industry while the latter represents merely a profession. He quite rightly complains of the inadequate salaries paid to engineers. He seems to be of the opinion that a purely professional society might look after the interests of its members better than does a society which represents an industry.

One of the reasons that the Engineering Institute is devoting so much attention to the status of its members is because of belated recognition of the fact that its members need to take united action in order to secure their proper position in the community. Mr. Reid evidently sees the activities of the Engineering Institute grounds for hope of securing for engineers such privileges as are enjoyed by members of the legal and medical professions.

This striving after improvement in the status of engineers by class legislation is, we believe, doomed to failure. The general interests of the country do not permit the granting of special privileges to engineers or to any other group of workers. Mining engineers who look on the Canadian Mining Institute as an instrument for obtaining privileges have, in our opinion, entirely mistaken the purpose of existence of the Institute.

While we would not like to see the Mining Institute attempt to obtain by legislation special privileges for its members, we do think that it might endeavor to look after its members in other ways. It might, for instance take an active part in looking after the welfare of its members by assuming more responsibility for their employment. A special opportunity for service to members is now before us. Men are returning from overseas and should be helped in their efforts to secure positions. If managers' willing to take on engineers would advise the secretary of their needs and all returned men would communicate with the secretary, very important assistance could be given to members who have been on war service.

Mr. Reid sees in legislation the remedy for low salaries. We cannot agree with him that the desired end is to be reached in this way. Some of the worst offenders in the paying of small salaries are those who like to be considered leaders in the profession. The remedy for unfair salaries lies with those directly concerned. There should be more frank discussions between managers and the engineers on their staffs. There should also be more open discussion in the Mining Institute, where other leaders in the industry as well as engineers could take part. Is it not important that engineers should bring this matter to the attention of managers and directors of mining and metallurgical works and to others interested in the industry, whether such men happen to be engineers or not? Is it not actually an advantage to the engineer that one-fifth of his audience in the Canadian Mining Institute represents other sides of the industry and can be expected to come to the assistance of the engineers, if the latter present a strong case.

The advancement of the status of the mining engineer is not the chief purpose of existence of the Canadian Mining Institute. Since, however, four-fifths of the members are technically trained men and the other fifth is composed of men whose sympathies as well as interests are with the technical men, it is obvious that the Institute is able to advance the interests of mining engineers.

As expressed in our editorial of November 15th, which started the discussion, the chief purpose of the Canadian Mining Institute is to assist in the development of Canada's mineral resources. The purposes, according to the charter, are: "First, to promote the arts and sciences connected with the economical production of valuable minerals and metals, by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications. Second, the establishment of a central reference library and a headquarters for the purpose of this organization. Third, to take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada. Fourth, to encourage and promote these industries by all lawful and honorable means." The improvement of the status of mining engineers will come with more general recognition of the value of the services of engineers. They must lend their abilities to the service of the community and they must also let the public know that they are doing so. By greater service and by more publicity there will be attained better recognition. Mining engineers have in the Canadian Mining Institute a splendid medium for making themselves useful to their fellow engineers and to others in the industry. By helping one another they will make the Institute stronger. The Institute representing the in-

dustry can help mold public opinion with regard to the industry and the men in it. We do not claim that the Institute has done all it might do; but we do claim that it occupies a place in the industry, that it has important work to do, that it fills the need for a professional society without being merely a professional society, that it is aiding in securing the much desired application of science to industry, and that it provides a means for social intercourse that is of advantage to both members and the industry.

Even those who look on membership in societies as a means of advancing their own interests should see in the inclusion of non-professional members many advantages. If the engineer wishes to advise those who are directing or managing mining and metallurgical companies of needed reforms and of necessary safeguards for the good standing of the profession, the Institute offers an excellent medium for discussion. Non-professional members who put up money for mining ventures are just as keenly interested as engineers are in the status of the engineering profession. They may be counted upon to assist in the exposure of fakirs and to approve and support proposals for educating the public against spending money on properties that have not been examined and favorably reported on by competent men. We would not like to think that many men belong to the Canadian Mining Institute simply because they expect it to improve their professional status, but even these will find some value in such membership.

In our opinion mining engineers should join the Canadian Mining Institute with the object of encouraging and promoting the mining and metallurgical industries by all lawful and honorable means, as set forth in the application for the charter. By serving the industry in this way they will undoubtedly serve their own interests also, for they will profit by the work of their fellow members. Those who give much from their own experience receive much in return.

THE HAILEYBURY SCHOOL OF MINES.

In this issue we present some account of the Haileybury School of Mines. Our readers will be especially interested in this for several reasons. The provision of facilities for study, in a mining district, of mining and metallurgy is itself much to be desired. Even more important is the evidence of interest taken by mining men and by manufacturers of mining and milling machinery in the establishment of the school. These men are deserving of more credit for what they have done for the coming generation than they are likely to get. It is not an easy matter to obtain such practical interest in educational matters, as many educators well know.

With the guidance of the men who have played a large part in establishing the Haileybury School of Mines, we may confidently expect that institution to turn out men who will be fitted not only for technical work in the mining industry, but also trained in good citizenship. These young men will soon be playing a large part in developing Northern Ontario. They will do well to remember what is now being done for them and endeavor to uphold on every occasion the honor of their school and in later years to do their part for those who follow them. The school will be known by its graduates. Those who have assisted in fitting these students for their work in the industry will measure their success by the character and ability of the graduates, and by the interest which the latter take in the school after they leave.

THE FUNCTION OF OUR SCHOOLS AND COLLEGES.

One of the leaders in the campaign for education better fitted to the needs of our citizens is Mr. C. V. Corless, of Coniston. In an address to the College and High School Department of the Ontario Educational Association last April, Mr. Corless said in part:

"It is not the main business of our schools and colleges to impart that knowledge which is mere information; nor even to cultivate, to stimulate the power of research, discovery and independent thinking—of vastly greater importance though this may be; but it is their main business, as I conceive it, to lay the foundation of, and as far as opportunity offers to build in each student who passes through them, that sound and sterling character which is manifested in all social relationships by standing foursquare to every temptation, economic or other. So far, we are probably all agreed. Where we may differ is in coming to a conclusion as to the most sane and efficient way of doing this. * * * We must regard it as the chief intellectual aim of school and college education to assist the student to acquire that vitalizing contact with, that intelligent rooting of experience in, those real things and activities of the world in which he lives, which alone stimulate and sustain real mental growth, and an intelligent inductive study of which secures best the material progress, and strengthens most the moral purposes of mankind. This alone will form a secure foundation for civilization based on justice, good-will and the acceptance of responsibility.

"Among the gravest defects of our entire general educational system at present are the paucity of actual material things brought into use as an educational medium; the assumption that real education can be acquired chiefly through a carefully graded manipulation of the symbols of knowledge; the too ready acceptance of facility in the use of these symbols as a substitute for real education and the failure to discern clearly the undemocratic evils which necessarily result from a programme and methods based on this false conception. This has resulted in inefficiency in many directions. For we must conceive the intel

lectual aims of real education to be the acquirement of that power and eager desire which grapple quickly and intelligently with the difficulties of such original practical situations as arise in life outside the schoolroom; the attainment of that readiness and adaptability which quickly bring to bear on the solution of such difficulties, every available resource or experience, whether obtained personally, or through consultation with others, or from accumulated stores of recorded experience. It must develop: that originality which quickly discerns a new problem and seizes on its essential conditions; that concentration which leads to its clear statement and the rejection of irrelevant conditions; that judgment which selects with reasonable sureness the problem worth tackling and rejects the problem incapable of solution or the one likely to cause the frittering away of any unreasonable amount of time, energy or capital in effecting its solution.

"The effective cure for social ills in a democracy —inclusive of the antagonism between Capital and Labor—can be found only through an educational system that takes clear account of them; that adapts its training to meet them; that has ample resources and authority committeed to it for this purpose; that accepts full responsibility for doing so; and that definitely concentrates its full resources and the best ability procurable on the problems of society. This may, and, I believe, does, mean a greatly increased scope and outlook for the work of education. This can never be accomplished by schools and colleges that work in semi-isolation from the practical affairs of the world around them. It can only arise from educational institutions having the most vital relationship to their surroundings, physical, industrial and social. Our schools should shed tradition and rise to democracy's great needs."

Mr. Corless speaks with the authority of experience as teacher and as manager of an important industrial concern. Long and earnestly he has given his attention to the problem of providing better education for the communities in which he lives. He has recently come out into a wider field, and we believe that he will draw many to his standard in the fight for educational reform.

Mine managers frequently find themselves in the position of leader of a community. They must give much attention to the housing, recreation and education of the families of their employes. They could assist Mr. Corless and his co-workers by drawing on their experience. Others can assist by making themselves familiar with the literature on the subject and by giving publicity to the suggestions which appeal to them as specially helpful. The cause is a good one and worthy of the support of the industry which claims the sage of Coniston.

MINING SOCIETY OF NOVA SCOTIA.

The annual meeting of the Mining Society of Nova Scotia will be held in New Glasgow on the 23rd and 24th of April. Arrangements will be made to visit the collieries of the Acadia Coal Company and the works of the Steel Company at Trenton, and to have a number of papers which will deal with such diversified mining matters as new methods in limestone quarrying, new discoveries in the Pictou coalfield, local manufacture of refractories and bricks by the steel companies here, oil-shale development, electricity applied to mining coal, local salt mining development, etc. A full meeting is expected, as New Glasgow is centrally located.

THE PAS BOARD OF TRADE ON LEASEHOLD SYSTEM.

At a meeting at the Pas some weeks ago the following resolution was passed:

"The Pas Board of Trade hereby resolves that the regulations now in force whereby a lease is granted for mineral properties staked under the Quartz Mining regulations should be cancelled, as being inimical to the progress of the mining industry in Manitoba, and that the freehold system formerly in force be reestablished; and that a copy of this resolution be presented to the Manitoba Branch of the Canadian Mining Institute at its first meeting for further consideration."

B. C. Mine Owners Will Not Recognize Committee

That the Mine Owners Association of British Columbia will not recognize the Committee which has been authorized by the Dominion Government to investigate the question of the rates charged for ore treatment by the Consolidated Mining & Smelting Company at its Trail Smelter is the effect of a statement issued by C. F. Caldwell, president of that Association. He says:

"I am in receipt of a notice of a meeting of the Committee appointed by the Associated Boards of Trade of Eastern British Columbia, and approved by the Dominion Government to make the investigation into the smelter rates at the Trail Smelter to be held at Nelson, B.C., on January 21st.

"I, as president of the Mine Owners' Association, cannot recognize this Committee as meeting the conditions of the petition of the mine owners, circulated and signed by a majority of the mine owners, mine workers and business men of the entire Slocan District, and presented to the Dominion Government by myself in person.

"Should the mine owners appear before this committee, they would be giving their approval of this mode of investigation. When we publicly protested to both the Dominion and Provincial Governments against the committee form of investigation, believing it was brought about for the express purpose of defeating the resolution of the mine owners, which asked for the appointment of a Royal Commission, one member to be chosen by the mine owners, one by the smelter, and by the government. This would have been an investigating commission which would have brought results."

Correspondence

MANITOBANS WANT FREEHOLD SYSTEM.

To the Editor of the Canadian Mining Journal:

Sir,—In connection with the question of freehold versus leasing system for acquiring rights on mining lands, recently raised by the resolutions of The Pas Board of Trade and the Manitoba Branch of the Canadian Mining Institute, several points of view as held by those representing the mineral industry in Manitoba must be presented.

It appears that the Canadian Mining Institute placed itself on record recently as being in favor of the principle of leasehold tenure of mining claims and the case was so presented to the Dominion Government. Probably this move on the part of the parent Institute had a good deal to do with influencing the framers of the order-in-council which inaugurated the leasehold system for Dominion mining lands in the Prairie Provinces. It should be pointed out in this connection that at the time this change was considered, there was little development and few indications of immediate development of mineral wealth on these Dominion lands, and the Western Provinces, in which the scheme has been applied, had little or no representation of those interested in metal-mining, in the Canadian Mining Institute.

Since the time of the passing of the order-in-council, there has been considerable development of metal-bearing claims, particularly in Manitoba, and the many new and promising discoveries of the past few months in this Province indicate that there will be a considerable production in the near future from Dominion mining lands, providing that conditions be made favorable. At the same time there has been a growing body of mining opinion, and the Province for the first time is represented by a strong Branch of the Canadian Mining Institute.

In the older mining Provinces of British Columbia and Ontario and in most of the Eastern Provinces, there has been no strong tendency shown to follow the advice of the Canadian Mining Institute, by introducing the leasehold system of tenure, and the mining interests in Manitoba feel that they are in a disadvantageous position, having the leasehold system adopted for them while on either side the old freehold system still attains.

The question is intimately bound up with the demand of the Western Provinces for their natural resources. Had Manitobans felt sure that their resources would soon be handed over to them, the question of the system of tenure would not have been raised. If the resources are not handed over to the Province and the leasing system is retained, we have the mining industry of Manitoba placed in a ridiculous position as pointed out recently by Professor Wallace, Commissioner of Northern Manitoba:—So far the Dominion Government has not undertaken the onus of directly aiding mineral development on Dominion Lands; at the same time the Provincial Government can not be approached for aid for the simple reason that they have no interest in and no prospect of acquiring interest in and revenue from mineral production. If the old freehold system were still in force, the Provincial Government would see some prospect of getting control of the producing mineral lands, and could legitimately take a direct interest in fostering mineral production.

If the other mineral-producing Provinces were working under the leasing system, the case for Manitoba would not be so strong; but as it is, Manitobans seem to have legitimate ground for their belief that the present arrangement results in a discrimination against them, particularly in connection with the attraction of the large amounts of capital so necessary for the development of mineral resources in the present inaccessible portions of their Province.

It is the intention of the Manitoba Branch to present their case to the Canadian Mining Institute before taking any other action; and it is to be hoped that the order-in-council, to which they object, will be the object of some attention during the next session of the Dominion Parliament, unless it is intended that the Western Provinces shall assume control of their resources in the near future.

The writer, as Secretary of the Manitoba Branch, feels that it is his duty to present at least part of the Manitoba case, and to introduce a discussion, into which it is hoped some others from Manitoba and the other Prairie Provinces will enter, and from which those of other Provinces who are interested in the question, will grasp our point of view.

Yours, etc.

THE ENGINEER AND THE INSTITUTE.

To the Editor of the Canadian Mining Journal:—

Sir,—Two editorials, one of the Canadian Mining Journal (Nov. 1st 1918) and the other of the Canadian Engineer (Nov. 7, 1918), discussing the respective professional standings of the Canadian Mining Institute and the Engineering Institute of Canada have been subjected to considerable criticism in the letters of several members of the former society published in the December Bulletin of that Institute. These correspondents take the ground, that the Mining Institute as a professional body is quite on a par with the other, and moreover better fitted to represent the profession of mining engineering than the Engineering Institute, and that therefore the conclusions arrived at in the two editorials were entirely unjustified. I may say however, that I found the arguments advanced by these gentlemen quite unconvincing, and that from the standpoint of a professional mining engineer I find myself in accord with the views expressed by the two editors.

In my estimations a technical society is a body composed purely of technical men, who are banded together for their mutual interest, and the advancement of that particular branch of technology to which they belong; such an organization is comparable to the Medical Society, Bar Association, or other such purely professional body. An Industrial society on the other hand, while it may have many points of resemblance to a technical society proper, differs in being devoted to the interests of the industry as a whole instead of to those of any particular growth within it, for which reason it has a mixed membership representing different phases of the industry in question.

The Canadian Mining Institute certainly belongs to the latter class. I fail to see how, with a non-technical membership variously estimated at from 20% to 25%, to whom are open all the privileges, including election to the highest offices, it can claim to be anything else

than an industrial organization. [Associate members, of the Canadian Mining Institute are entitled to vote but not to hold office—Ed.]

The Engineering Institute of Canada, on the contrary, is a purely professional institution. Only engineers compose its active membership and direct its activities. Until recently it was mainly a civil engineering society, but of late it has broadened its charter and endeavored to enlarge the scope of its functions, so it would be well for mining engineers to consider what advantages they might derive from its membership.

It is an unfortunate fact that the technical professions, including the various branches of engineering, are very poorly paid. The graduate of a school of applied science of several years experience, receives a salary hardly on a par with the wage of a mechanic, or the stipend of a clerk. Of this then is abundant proof. I need only refer to the statements of Mr. A. A. Cole, past president of the Canadian Mining Institute, relative to the salaries offered to applicants for legal and technical positions in the Civil Service of Canada. In the first case, the salary was $3,300 per annum and the requirements such that they could easily be fulfilled by any mediocre lawyer, while in the second, the salary was $1,600 per annum, and the applicants had to show qualifications practically equivalent to a Ph.D. degree in science. Recently a still more flagrant example has come to my attention. I was shown a circular letter from the Civil Service commission dated Nov. 21st 1918 in which three positions are advertised.

(1) A secretarial clerk at an initial salary of $1,800 per annum.

(2) A female clerk for the Department of Labor at an initial salary of $1,600 per annum.

(3) An assistant engineer for the B.C. Hydrometric survey who must be a university graduate with two years field and office experience at an initial salary of $1,500 per annum.

These facts speak louder than words of the esteem in which the engineering and technical professions are held in Canada.

As to the profession of mining engineering in particular, what do we find? Not only are the salaries paid to the bulk of its members on a par with that above set forth, but in addition, it is infested with charlatans and impostors who practice their knaveries without let or hindrance on the part of the law, to the great detriment of the fair name of the profession.

In my mind there is only one remedy for this state of affairs, and that is, the formation of a strong professional organization which will take the needed legal steps to secure the interests of its members, and which will give them a professional standing equal to that of the legal and medical professions. The Engineering Institute of Canada does in great measure fulfill the requirements as above set forth; it is purely a professional body and it has made efforts to obtain the legal protection of its members, with some degree of success, as witness the Quebec and Manitoba acts relating to civil engineers. As mentioned above, this society has now broadened the scope of its activities and is attempting to secure the affiliation of allied branches of engineering. If it is successful in this endeavor there is no doubt that an effort will be made to revise the status of the engineering profession in Canada and likewise to give a much needed legal protection to its members.

In the Canadian Mining Institute I believe that an effort is being made to make a distinction between the technical and non-technical members. Personally however I am doubtful of the success of this measure, as it will probably provoke the opposition of the influential non-technical section, who will likely regard it as an attempt to bar them from full participation in the privileges of the Institute. Even if successful, it still remains doubtful whether the professional members will gain much prestige thereby. The institution as a whole will still retain its original character in the public mind, so that differentiation between technical and non-technical members will be difficult for outsiders; considering the matter therefore, from the standpoint of the professional mining engineer, let us consider the relative advantages offered by the two societies.

The Engineering Institute is a clear cut professional organization, devoted primarily to the interests of its members and not connected with any particular trade or industry.

The Canadian Mining Institute on the other hand is somewhat different in its aims, being essentially devoted to the development of the mining industry, and hence not concerned with the interests of its members except in so far as they affect the status of the industry.

In view of these facts it is obvious that the claims of the former society deserve a prior consideration over those of the latter, so much so, in fact, that it is difficult to conceive how anyone, regarding the matter from a professional view point, can think otherwise.

Finally, I think that there is abundant room for the two societies to flourish without interfering with each other's development; the mining engineer, undoubtedly, will find it to his advantage to belong to both organizations, to the Engineering Institute, to protect and improve his professional standing, and to the Canadian Mining Institute to keep in touch with the development of his calling.

Your, etc.,

J. A. REID.

Cobalt, Jan. 17th, 1919.

Canadian Collieries Planning to Open More Mines.

Considerable interest is taken by coal mine operators of British Columbia in the announcement attributed to local officials of the Canadian Collieries (D) Ltd. that plans are being prepared by the company for the opening of new mines on the Island and generally extending operations. On January 6th a meeting of the Directors was held at Montreal when the resignations of Sir William Mackenzie as president and Sir Donald Mann, as a director, were received, their places being taken, respectively, by Mr. H. S. Fleming, of No. I. Broadway, New York, and Mr. F. Perry, of Montreal.

Regulation of Coal Mining in Alberta.

At a meeting of the Federation of Labor of the Province of Alberta held at Medicine Hat, Alberta, on January 10th, several suggestions affecting the regulation of coal mining in that Province were endorsed which, if put in the form of legislation and enforced, will radically alter the present conditions. One provides for the compulsory use of electric safety lamps; another, that mine inspectors shall be elected and be subject to recall; and a third that a 6-hour day shall be granted to all underground workers.

Dr. Stansfield's Report on Electric Smelting of B. C. Iron Ores

"The Commercial Feasibility of the Electric Smelting of Iron Ores in British Columbia" is the subject of a report recently completed by Dr. Alfred Stansfield, Professor of Metallurgy at McGill University, and Consulting Metallurgist, Montreal, who is acknowledged to be one of the foremost of America's authorities in this line of industrial endeavor.

The report is lengthy, dealing with the matter from all angles in a very exhaustive and detailed manner. Its conclusions, summarized, are that the problem is perfectly feasible from a metallurgical point of view, that British Columbia has a sufficient supply of ores of a quality well suited to the process and capable of being converted into a high quality of iron or steel, and that there also are available all requisite fluxes, etc., wherewith to carry out the process completely. But two difficulties are made clear. That which is most emphasized is the question of the cost of electric power under existing conditions. Dr. Stansfield finds that, with power at the rates which he was quoted by the largest companies of the Province, the profitable production of pig iron by means of electric smelting would not be feasible. He deals, too, at some length with the market and the impression given by his observations is that the immediate local, and the demand likely to be evidenced from outside within a measurable period, are not sufficient to justify the establishment of a large plant of the character under discussion.

In this connection a few remarks by Dr. Stansfield in introducing his report are apropos. He says:

"Early in the investigation it appeared that electric power might be obtained at such a price that electric smelting by the methods now in use would be commercially possible. I, therefore, investigated and discussed carefully the type of furnace and design of plant that would best suit the local requirements, and prepared estimates for the cost of such a plant and of making pig iron on a scale determined by the present requirements of the Province. It now appears that electric power cannot, at present, be obtained at prices that will permit of the use of the usual electric smelting methods; but I am presenting the results of my investigation along these lines because they are needed to show that the process described would be too costly at this higher price, and because it is possible that, in the future, power may be available at a lower price, which would then permit of operations being undertaken. In view of the very high price asked for electric power I have paid special attention to a new process for producing electric furnace iron which offers possibilities of a decided economy as compared with standard methods."

After dealing generally with electric smelting, Dr. Stansfield, having pointed out that it is a process which has passed the experimental stage being in operation commercially on a large scale in Sweden and elsewhere, explains that the pig iron normally produced by the standard electric furnace is unusually pure and unsuitable for use in the iron foundry. He adds: "The officials of the Swedish Company consider that a foundry iron can be made by these furnaces, though at somewhat higher cost, but I have no evidence that this has been accomplished in regular commercial practice, and the Noble Electric Steel company, which smelted iron ores electrically for several years at Heroult in California, was obliged to adopt a different type of furnace for the production of foundry iron. I consider, however, that the Electro-Metals furnace could be used for this purpose because any low silicon iron could be made suitable for foundry use by additions of ferro silicon ——."

The essential conditions for the electric smelting of iron ores on a commercial scale are said to be—a supply of high grade ores at a reasonable price, an ample supply of cheap electric power, a supply of charcoal or other fuel at a moderate price, a supply of labor at a moderate price, a suitable location for the smelting plant and a suitable market for the resulting iron at a rather high price.

Dealing with his subject under these headings the writer says of the iron ores of British Columbia that they have not been opened to any extent, but that it may be safely assumed that there are "adequate supplies of ore of reasonable richness and purity at easily accessible points. These ores are chiefly magnetites, and on this account, are undesirable for use in the blast furnace, except in admixture with other ores. Magnetites are, however, quite suitable for treatment in the electric furnace. It appears that the ores are not of very high grade, but that a supply may be expected to contain from 50 to 55 per cent of iron. The ores are practically free from phosphorus and titanium, and the proportion of sulphur can probably be kept as low as 0.1 per cent. The ores under consideration are also practically free from copper. Your officials estimate that a supply of 50,000 tons per annum of ore of this grade can be delivered at a suitable smelter site, at a cost, under present conditions, of about $4.00 per net ton ,which would be made up as follows:

Mining	$1.50 to $2.00
Loading or tramming	0.15 to 0.25
Freight (by water)	1.00 to 1.50
Unloading	25 cents
Royalty to owner	50 cents
Total cost at smelter	$3.96 to $4.10

"From the information at my disposal I am satisfied that these ores can be smelted electrically for the production of a high grade pig iron. For the production of one long ton of pig iron about 2.0 net tons of 55 per cent ore would be needed, so that the ore would cost $8.00 per long ton of pig iron. In view of the somewhat low grade of the ore, the cost of smelting per ton of product, will be somewhat higher than is usual with the Swedish ores, but this may perhaps be remedied by the use of magnetic concentration."

Referring to the question of power, Dr. Stansfield says: "British Columbia is well supplied with water powers, and many of these can be developed cheaply for the use of electric smelting and similar industries. Competent engineers have assured me that some of these

powers in accessible locations can be developed at such a cost as to yield a continuous electrical horse-power for smelting at a cost of $10 per annum. This figure is not much higher than obtains in Sweden and if a dependable supply of power can be secured at this rate it seems almost certain that an electric smelting industry can be undertaken profitably. The consumption of power, under conditions obtaining in British Columbia, would be between 0.4 and 0.5 of a horse-power-year per ton of iron produced; so that the cost for power should be between $4.00 and $5.00 per long ton of pig iron. Some 8,000 or 9,000 horse-power would be needed for a daily production of 50 tons of pig iron. In view of the desirability of producing pig iron at the earliest possible time, and of the difficulty and expense attending the development of water powers under present conditions, it is highly desirable, if not imperative, that an electric smelting industry shall be supplied, in the first place, from powers that are already developed."

The writer then explains that the B.C. Electric Ry. Co. has surplus power, that when in the Province its management stated that it possibly could be delivered at $15.00 per horse-power-year, but since he had been informed that the charge would have to be $27.80 per horse-power-year, which would represent a charge of from $11.00 to $14.00 per ton of iron. The latter would be the rate on the British Columbia Mainland, but on the Island 2,000 k.w. of power would be available for a short period, and subject to peak load restriction, at $15.00 per horse-power-year. The increase, it is maintained, makes it altogether too high to allow of commercial production of pig iron by present methods at or near Vancouver City. As to Vancouver Island it is stated that its supply, "besides its uncertainty, is too small to permit of profitable operation."

In discussing the necessity of having supplies of charcoal and coke for reduction, Dr. Stansfield states that "the consumption of charcoal varies with the grade of iron required, and the type of furnace employed, from about 0.4 to 0.5 net tons of charcoal per long ton of pig iron, so that 20 to 25 tons of charcoal would be needed daily for an output of 50 tons of pig." He adds that, while there is no considerable charcoal industry at present, there is in the coast districts of British Columbia an abundant supply of timber from which charcoal can be made suitable for use in electric smelting. In view of the large amount of wood waste produced at some of the large mills it is thought reasonable that a well designed charring plant could be erected "that would utilize this waste material and deliver charcoal to the smelter at a cost of from $6.00 to $8.00 per net ton; estimated on the following basis:

2½ cords of Douglas Fir mill waste.....	$2.50
Cost of charring, less returns for by-products..	2.50
Carriage of charcoal to smelter	1.00
	$6.00

The charge per ton of iron would thus be between $2.40 and $4.00.

It is pointed out that Douglas Fir, which would probably constitute the staple supply for charcoal making, "does not furnish by-products of suitable quality and quantity to warrant the use of elaborate methods for their recovery," but the opinion is expressed that by making the charcoal "in large kilns, or in some appliance which might be devised to char the wood waste with the minimum amount of hand labour" a partial recovery of by-products could be made at moderate expense. It also is asserted in this connection that as coke cannot be produced from British Columbia coals as cheap as charcoal can be made, it would be more economical to use the latter.

Dr. Stansfield's investigations have led him to the conclusion that the cost of labor might be from $4 to $5 per ton of iron, although in the intial stages of the industry it might run as high as $7 per ton of iron. As to the location of a smelter plant he says that it should be conveniently situated with respect to the supplies of ore, charcoal and other requirements and should also permit of the cheap delivery of the iron and other products to the market. He also emphasizes the importance of having it located close to the source of electric power, so as to lessen the cost of transmission. With reference to the market it is stated that the consumption of pig iron in British Columbia now is only about 10 tons daily. It is suggested that with more moderate prices this consumption might be raised to 20 or 30 tons daily. As this would be too small to permit of economical commercial operation it is recommended that, if a suitable supply of electric power can be obtained, a plant be constructed to produce say 25 tons daily of foundry iron for sale and a further 25 to 30 tons of low silicon iron for conversion into steel.

Under the heading "Foreign Competition" reference is made to the possibility of an iron blast furnace being established on the Pacific Coast of the United States. It is estimated that pig iron could be made in such a plant under present conditions at a cost of about $25 per long ton. On this point it is added that "the duty on pig iron entering Canada from the States is $2.80 per ton plus 7½ per cent ad valorem which, at the sale price of $30.00 per ton, would amount to $2.25 per long ton, or a total charge of about $5.00. This duty, together with the freight charge and the Canadian bounty, would place the electric furnace iron, if made with $15 power, on an equality with the imported blast furnace iron. "The report continues: "In this connection it may be added that a large iron and steel plant can scarcely be built until some years after the war, so that an electric furnace plant, if constructed promptly, would command the market for a number of years. Ultimately, blast furnace iron may be expected to take a part at least of the market for common grades of iron, but the electric furnace should always be able to command a small market for its higher grade of iron."

Mention is made to the action taken by the Dominion Government recently for the encouragement of the industry in the Canadian West, which consists of the guarantee for a period of three years of the purchase of any surplus production "at the market price at the time." Dr. Stansfield's observations on this point are interesting. He says: "This agreement will no doubt apply equally to electric furnace iron, but it does not appear to me that it is likely to help matters materially, for the following reasons: 1. The offer is obviously of no use if the price referred to is that obtaining in Eastern Canada, as iron could not be made at that price. 2. If the price intended is the local price in British Columbia we are met with the difficulty that the Government's ability to carry out the undertaking would be limited to the local demand for iron, as it would be impossible for it to buy expensive iron in British Columbia and ship it to lower priced markets elsewhere. We are thus limited to the natural market for iron and steel in British Columbia and to possibilities for exportation on a small scale. Commenting on the action of the Provincial Government in respect of placing a bounty on the production of pig iron within the Province the wri-

ter states: "The Provincial Government has offered a bounty of $3 per net ton of pig iron made in British Columbia from local ores and on the other hand imposes a tax of 37½ cents per net ton of ore mined. The combined effect of these measures will be a payment of about $2.60 per gross ton of pig iron; a source of income which will be of some importance, and may sometimes make the difference between working at a loss and at a profit."

Touching on the type of furnace which should be adopted the following conclusions are reached:

"(1) If a permanent smelting plant were being erected, the Swedish type of furnace would be selected, because it is more economical than any other at present in use, and is the only one that has been employed commercially.

"(2) If a temporary plant is contemplated it may be better to install the open pit furnace, on account of its smaller first cost, and the ease with which it could be converted to other uses.

"(3) Information should be obtained with regard to the iron ore reduction process of Trood and Darrah, as this may prove superior to any direct smelting process. If this process is likely to be available, it will be best in the meantime to use a simple pit furnace, rather than to install the more elaborate Swedish furnace."

As to cost of production it is stated that a simple plant, assumed for purposes of calculation only, would consist of three electric furnaces of 3,000 K.W. each, producing altogether about 80 tons of pig iron daily, and would cost from $350,000 to $400,000 to erect in British Columbia.

The cost of making a long ton of foundry pig iron in such a plant would be estimated as follows, assuming that power can be obtained at $15.00 per horse-power-year:

Iron ore, 2.0 net tons at $4.00	$8.00
Electric power, 0.45 h.p. year at $15.00	6.75
Charcoal, 0.4 net tons at $8.00	3.20
Electrodes, 15 lbs. at 8 cents	1.20
Repairs and maintenance	1.00
Labour	4.50
Management	2.00
Interest, 6 per cent on total capital, and depreciation, 10 per cent on cost of plant	2.60
Royalty to Electric-Metals Company	0.50
	$29.75

A further table is given showing that, with 0.5 cent power the cost per ton of pig iron would be $40.50.

Dr. Stansfield refers to a new process by which granulated oxidised ores mixed with carbon are roasted in a fuel-fired furnace and thus reduced to the metallic state. This reduced metallic sand is then melted in an electric furnace at an expenditure of 1-3 of the electric power required to both reduce and melt the ore in the electric furnace. This process, it is pointed out, seems to offer possibilities to electric smelting that are now lacking. The process, however, is only in the experimental stage, and is not available at present, but may in the future bring electric smelting of British Columbia iron ores within commercial reach.

In his general conclusions Dr. Stansfield again outlines the general requirements for a successful industry; dwells on the importance of the price of power which is higher, as quoted by the company having the largest supply of unused power than the industry could bear; and asserts that "in view of the small demand for pig iron in British Columbia it would be almost essential, if a smelting plant is to be established on an economic basis, that additional products should be turned out. Steel for castings and small rolled sections, and ferro alloys such as ferro manganese, ferro chrome and ferro silicon, could be made suitably in such a plant. These additional products would permit of more economical operation, would enable larger profits to be made, and would allow the plant to continue in profitable operation if, at any time, the price of pig iron were to fall below the cost of production.

Finally the following recommendations are submitted:

(a) To develop one or more of the best iron ore deposits and to make complete tests of the ore.

(b) To reserve a suitable water power for future development.

(c) To establish a plant for the economic production of charcoal from mill waste.

(d) To investigate the new process for the production of electric pig iron, and if this is found satisfactory to begin immediately to produce the pig iron; purchasing power for this purpose until the water power can be developed.

Prof. Stansfield was commissioned by the Hon. Wm. Sloan, Minister of Mines in the British Columbia Government, to investigate the conditions in this Province with respect to the electric smelting of its iron ores and to make the report thereon of which the foregoing is a brief summary. It is accepted as a clear exposition of the problem facing those ambitions to see the natural magnetite resources of the Canadian West exploited and, besides furnishing the Provincial Administration with valuable information for its guidance in the consideration of its policy towards this phase of industrial development, is expected to be of material help to private interests which have been considering the possibilities of an Iron and Steel Industry in the Northwest.

COAL MINE OPERATIONS IN WESTERN BRITISH COLUMBIA.

Discussing the coal mine operations in the western section of British Columbia, which includes Vancouver Island, during the year 1918, Mr. W. M. Brewer, Resident Government Engineer, states that there has been no abnormal progress, but that the advance has been steady despite the difficulty of obtaining capital and labor as well as the set-back sustained by the industry in the latter part of the year through the Influenza plague. "Wages", he says "paid to all classes of miners have advanced steadily during the year and to such an extent that many coal miners are receiving as much as $10.00 per day and upwards, and the minimum wage, since the last increase made on November I, is about $5.00 a day." He observes that there have been no labor troubles resulting in strikes in his district, although such were threatened, "but the questions in dispute were settled by conferences in which the employers, employees and Government officials participated." Continuing he states that "prospecting for coal has been carried out at the following localities: Near Chase River (Vancouver Island) by the Canadian Western Fuel Co., Ltd., on the Company's farm, Five Acres District, West Nanaimo, where the Wakesiah Mine is opened; near Craig's station on the Alberni extension of the E. & N. Ry. Co. by the Canadian Collieries (D) Ltd.; also at Wellington by the same Company, as well as by Mr. H. Shepherd and associates, of Nanaimo. The last mentioned drilling was done in the expectation of locating the old Well

ington seam at a point where it had not previously been worked, and as the operations were suspended by both outfits, it is presumed that the results were not satisfactory. Near the mouth of Chemainus River some foreshore leases were acquired by Messrs. H. W. Treat and associates, of Seattle Wn., and drilling was commenced at this point in December, 1918. A new discovery of coal outcroppings was made last Summer on the land of the Canadian Collieries (D) Ltd., on the Tsa-Abl River (sometimes called the Baynes Sound River) at a point about five miles up the river from its mouth. The company is opening up a road into the district in order to haul in and instal a diamond drilling plant to prospect the field this year." In the course of an enumeration of new mines which have been opened in the past twelve months and outlining new work done on old properties Mr. Brewer states that the Canadian Western Fuel Co. on the Wakesiah Mine has sunk an air shaft to coal on the Wellington Seam and connection has been made with the main shaft which reached coal at a depth of about 325 feet. The development of the property is proceeding and it is expected that an output of 500 tons of coal per day will be reached by about the middle of 1919. The estimated cost of the plant, railway connecting the mine with wharves and bunkers on the water front at Nanaimo, as well as initial development, is approximaticely $200,000. The new Mine of the Granby Consolidated Mining & Smelting Company at Cassidy's, Vancouver Island, which now has been opened by three slopes and is producing is not expected to be fully equipped with the plant proposed for about one and one half years. The estimated cost of the completed plant, including railway connection with the E. & N. Ry., coal washer, houses for staff, miners and workmen is approximately $1,000,000, when the capacity of the plant will reach about a quarter of a million tons of coal per annum. The maximum thickness of the seam is 12 ft.

The Granby Company, which has laid plans for a community at Cassidy's which in their provision for the housing of the workers will be the last word, has taken over direct supervision of the building from the new defunct Taylor Engineering Company. Many houses have been completed and in a few weeks twenty-five more will be finished, all of which are being modernly fitted. It is understood that about sixty others are to be constructed during the coming season as well as providing reading and recreation and pool rooms for the diversion of the employees. Dealing with development work on old properties Mr. Brewer states that the Canadian Western Fuel Company installed a new power engine (1,300 Killowatt D.C. generator) at the No. I. Esplanada Mine to replace the generator formerly in use. At the Harewood Mine the same company installed the following additions to the former plant: 1,200 Killowatt generator, two 150 h.p. boilers, and a new screening plant. The total estimated cost of these improvements is about $42,000. The Canadian Collieries (D) Ltd. carried on the following improvements at the No. 4 Mine, Cumberland, in the Comox District: Driven a new tunnel, the mouth of which is 15 feet higher than the entrance to the old slopes. The new tunnel is being driven directly over the old slopes and when completed will cut out the use of tail ropes to haul empties back from long flat from top of those slopes. A new tipple is being built at the same mine, with a Marcus screen installed in the tipple. The capacity of the plant is about 1,000 tons a day.

PRODUCTION OF COAL IN CANADA 1918.

The Department of Mines estimates the production of coal in Canada during 1918 upon the basis of monthly reports as approximately 15,180,000 short tons which was not only greater than production in 1917 by 1,133,000 tons, but was the largest production that has been obtained in Canada in any one year. The increased output of coal, however, has been derived almost entirely from the increased production in the Western Provinces, particularly Alberta. In Eastern Canada the production in the Province of Nova Scotia in 1918 was less than that of the previous year by about 337,000 tons and was the smallest production obtained in this Province since 1909. New Brunswick reached a higher production than in any previous year with an increase of 76,000 tons over a production in 1917. In Western Canada the Province of Saskatchewan appears to have produeed about 30,000 tons less than in 1917, while the increased production in Alberta was about 1,263,000 tons and in British Columbia 166,000 tons.

The production of 1917 and the estimated production in 1918 representing the actual amount of coal marketed or used and not including waste, slack, or unmarketable coal, are shown by Provinces herewith:

Coal Production in Canada.

	1917. Short tons	1918. Short tons.
Nova Scotia	6,327,091	5,990,000
New Brunswick	189,095	265,000
Saskatchewan	355,445	325,000
Alberta	4,736,368	6,000,000
British Columbia	2,433,888	2,600,000
Yukon	4,872	.....
	14,046,759	15,180,000

DEVELOPMENTS IN THE RICE LAKE DISTRICT, MANITOBA.

Since the discovery a few years ago of the Rice Lake gold-bearing area to the eastward of the southern part of Lake Winnipeg, the area has been considerably widened by the finding of gold in promising quantities in several adjacent areas. For a time the centre of chief interest, and still receiving a good deal of attention, is the area lying between Gold Lake and Clearwater Lake. The gold-bearing belt was found to extend still further to the east by the discoveries made in the Long Lake field. The latest discoveries meriting prominent attention lie in a northerly direction from the original Rice Lake area, to the north of the Hole River and in the vicinity of Hay Lake.

It will be well to follow custom and designate the whole gold-bearing field in this vicinity as the Rice Lake District and to indicate the particular fields in the order of their discovery and development:—(1) The Rice Lake Area; (2) The Gold Lake Area; (3) The Long Lake Area and (4) The Hay Lake Area.

During the past year, beyond some prospecting and assessment work, little has been done in the Rice Lake and Long Lake portions of the district.

On the Gold Pan claim, lying between Clearwater and Gold Lakes, development work on a small scale has been going on almost continuously. A shaft has been sunk to a depth of over 220 feet, and several short drifts have been run. It may be recalled that in an early stage of development some extraordinarily rich ore was encountered in the Gold Pan shaft. High-grade ore has been met in other parts of the shaft, and

in some of the drifts, while from the lowest part of the shaft as recently developed, come some very rich specimens.

The Provincial Government has an engineer engaged with a force of men in joining up the terminus of a winter road, constructed last year, between Fort Alexander and Gold Lake, with the Long Lake District.

Great interest has been shown recently in the developments on the Lulea Group of claims in the Hay Lake area, north of Hole River. The discovery was made by C. Andrews and for some time the claims were held by him and E. W. Jackson, of Winnipeg. Messrs. E. McDonald and C. M. Clark secured a controlling interest in the properties, which are held and operated by the Bellevue Mining Company.

The vein on the Lulea group is a quartz vein occupying a shear zone and carrying values in free gold and sulphides. Its width and length (from a few feet to twelve or more feet, and traceable across two or more claims) taken into consideration with the results of milling tests on sampled small-lots of ore, indicate that there is a sufficient quantity of good quality ore to warrant the considerable expenditure which the Bellevue Mining Company is making on the property.

Last winter an attempt was made by the operators to have some machinery taken into the district before the spring thaw; in this they were unsuccessful as the roads softened very early in the season. This machinery, consisting of a ten-stamp battery, an air-compressor and boiler, together with some supplies which were also stalled at Manigotagan last season, have been moved already to their claims.

As reported in the Winnipeg Free Press: "Forty-seven thousand feet of lumber has reached Manigotagan, as well as 25 tons of mining machinery purchased in the East. Another ten-stamp battery complete, together with some 150 tons of other machinery and fittings are now on the cars bound for Riverton, and will be rushed to the property.

"Everything will be run by electricity taken from the Winnipeg City Power Plant at Point du Bois." The Free Press also gives the information that there is a force of twenty-nine men working on the property and that the main shaft is down to a depth of 60 feet.

LIMESTONE FROM WINNIPEGOSIS.

Below is an average of three analyses of the high-grade limestone now being quarried near Winnipegosis by the Manitoba Gypsum Company for use in their manufacturing plant in Winnipeg:

	per cent.
Silica	0.41
Ferric Oxide	0.11
Alumina	0.20
Magnesium carbonate	0.66
Calcium carbonate	98.25
Total	99.63

SODIUM SULPHATE IN SOUTHWESTERN SASKATCHEWAN.

Winnipeg manufacturers are turning their attention to deposits of sodium sulphate occurring in Southwestern Saskatchewan. During the past year considerable interest has been taken in the search for potash deposits throughout the Prairie Provinces. Potash, as would be expected, has been found in many places but the low grade and relatively small quantity of these deposits make them at the present time look very doubtful as possible producers of potash salts. More abundant appears to be sodium sulphate and your correspondent is advised that important deposits of this salt with quality and quantity reasonably assured have been located in Southwestern Saskatchewan. There is a demand for this product in the pulpwood and glass industries. The former industry has been well established in Central and Western Canada and the latter may yet be an established industry in Manitoba when it is recalled that there are large deposits of glass sand available in the vicinity of Lake Winnipeg.

PRODUCING GYPSUM IN MANITOBA.

The Manitoba Gypsum Company, operating at Gypsumville and Winnipeg, has secured a considerable acreage on the shore of Lake Winnipegosis about six miles from the town of that name. The area is underlain by a high-grade limestone carrying 98.2 per cent of calcium carbonate together with small quantities of magnesium carbonate and argillaceous materials. It is the intention of the company to ship 1,000 tons of this material to Winnipeg during the coming year to be used in the manufacture of plaster, the Manitoba Gypsum Company being a large producer of a considerable variety of lime and gypsum plasters. The use of this raw material from a Manitoba locality is of special interest as hitherto the material which this production will replace, was imported.

Ore receipts in gross tons at the Trail Smelter of the Consolidated Mining & Smelting Company for the first week of 1919 aggregated 7,736.

Sales of Crown Granted Mineral Claims, which are in respect of taxes, are being advertised in different sections of British Columbia. Since the outbreak of the War the regulations in regard to Provincial dues have not been very rigorously applied, but from now on the authorities are likely to demand strict compliance with the laws. This, of course, does not mean that the terms of the Allied Forces Exemption Act which protects soldiers, sailors and their relatives while the former are on active service, are to be cancelled or in any way disregarded.

Kitelsas Mountain Copper Co.

A. J. Thompson, manager of the Kitelsas Mountain Copper Co., of Usk, B. C., is visiting Portland, Ore. to spend the holidays and to take up with members of the company plans for further development work in the opening up of the property. Discussing the results of the season's operations and the indications Mr. Thompson stated that there was a splendid surface showing and that, as far as work has been carried the outlook was promising. The ore is bornite containing copper, silver and gold and the veins, of which there were six, carried some free gold. To handle the latter it would be necessary to instal a mill and it was likely that this would be done before long. Four of the veins referred to were clearly shown on the surface. On driving a tunnel two others were cut which looked just as good. Five hundred feet of tunnelling has been done, including drifts. The original No. 1 vein had been cut, but did not show any great result. Drifting is being continued. A small shipment of ore had been made to the Tacoma Smelter and the result of its treatment would be waited with interest.

Special Correspondence

3 Grand Forks Furnaces in Operation.

Three furnaces now are in operation at the Grand Forks Smelter of the Granby Consolidated Mining & Smelting Company, and Superintendent Campbell expects that the Granby mines at Phoenix, B.C., will be able to ship sufficient ore to keep this number in operation continuously. It is stated that the fourth furnace may be "blown in" if ore shipping prospects warrant it. There is a supply of coke on hand and en route to meet the needs for a couple of months at least. Mr. Wakely A. Williams, superintendent of smelters for the Granby Company, who is responsible for the foregoing, also said that there was no immediate need of apprehension that the Grand Forks plant would be forced to close down. The price of copper, undoubtedly, would have an important bearing on the operation of Granby properties, and it might be necessary for production to be curtailed.

Queen Bess Mill Nearly Ready.

Mr. O. A. Thomas, manager of the Queen Bess Mining Company, reports that the concentrator being installed at that property is almost ready for operation. During the past eight months some $50,000 worth of machinery has been purchased in order to provide adequate equipment for the mine. The Queen Bess is a silver-lead-zinc proposition which was located in 1895 and which until a short time ago lay dormant. The steady development which has proceeded for the past two years has given the company a considerable ore reserve. A shaft sunk to a depth of 300 ft., Mr. Thomas says, proves the permanence of the ore bodies of the district.

The total ore receipts in gross tons at the Trail Smelter of the Consolidated Mining & Smelting Co. of Canada for the week from November 15th to November 21st inclusive, were 5,373 tons, making the year's total up to the latter date 294,922 tons.

Potash From Cement Plants.

At the request of the War Trade Board an investigation into the possibility of recovery of potash salts from the waste flue gas of cement plants is being undertaken in Canada. In the past Canada has produced small quantities of materials containing potash, not in any way meeting her demand for this valuable fertilizer, and it is thought likely that the by-saving what is wasted in the operation of cement plants the country may make at least a step towards independence.

Rich Silver Ore from Mary Reynolds Mine.

Some rich silver ore has been taken from the Mary Reynolds Mine, situated in the Stump Lake District, 35 miles east of Merritt, B.C. It is steel galena, and runs high in values. Specimens shown by Robert R. Hedley were taken from a drift at the 45-ft. level, where stoping is now in progress. The property has a shaft 100 ft. in depth, but Mr. Reynolds thus far has done work only on the 45-ft. level drift from this shaft. The vein at this point varies in width from three to five feet, the entire vein content being considered good milling ore, while some exceptionally high grade pockets are found. Development lower down will start at an early date. The vein, apparently a true fissure, shows on the surface at point about 900 ft. distant from each other. Open cuts at various points along the cropping expose the vein and ore is found in every opening.

Inland Mining Company.

The Inland Mining Company, of Walla Walla, Wn., has been operating the Eureka Mine, a copper property at Granite, B.C., in the Nelson Mining Division, for almost four months, during which period $15,000 has been spent on development. Production has been brought to 25 tons a day, the ore is being shipped to the Trail Smelter for treatment. Plans for further development include a long cross-cut tunnel and the construction of a tramway to the Canadian Pacific Railway. Mr. W. M. Meyers is superintendent at the mine.

Government Discontinues Prospecting for Platinum.

After the 31st of December no more platinum will be purchased at the Dominion Assay Office, Vancouver, B.C. This institution was opened during the latter part of the war for the purpose of encouraging the production of the metal in Western Canada, it being imperatively needed for war purposes. In this connection the placers of the Tulameen River were prospected by representative of the Imperail Munitions Board in Canada. The results of the latter work were satisfactory and indications were that, if development were continued as energetically as it started, a considerable quantity of platinum would be recovered. With the war over and the demand much lighter, operations by the Government on the Tulameen River have ceased. The Vancouver Assay Office was established to receive this platinum, as well as that recovered by companies or individual prospectors and operators throughout the Province, and also that of private individuals who cared to part with jewelry made wholly or in part of platinum. Payment was allowed, as soon as its value was confirmed, at the rate of $105 an ounce. While the latter arrangement will be discontinued by the new order, it is not believed to be the intention of the Canadian Government to withdraw the assay office, it being the opinion that it will be maintained for the benefit of prospectors and miners.

Coal Shortage on Pacific Coast.

The Alaska Bureau of the Seattle (Wn.) Chamber of Commerce and Commercial Club recently received an urgent appeal for a supply of fuel from the Territorial Council of Defence, Juneau, Alaska. W. A. Clark, chairman of the latter body, stated that there was only enough coal in Juneau at that time to last four days, and that none was to be found at Douglas City. As Juneau is in the Government Forest Reserve, no wood was available. Mr. Clark was told that the delay in despatching fuel to the North was owing to the fact that vessels of the Seattle-Alaska Fleet could obtain none in the Northwest. Since then, however, the freighter Latouche loaded 800 tons at the Pacific Coast Coal Mining Company's Bunkers, Seattle, and will discharge it at Wrangell and Juneau. It is feared that if shipments are not maintained more regularly there will be much suffering in the northern British Columbia and Alaska centres this winter.

Developing Gold Deposits on Proserpine, Mt., B.C.

The "Imperial" and "Independence" Group of Claims on Proserpine Mountain, a low rounded mountain situated just south of Barkerville in the Cariboo District, B.C., are showing up very satisfactorily as a result of recent development work. Present indications are that, properly handled, the properties will be made a productive gold mine. As far as the work has gone the veins are well defined and contain exceptionally good values. Whether, with further sinking, the condition will be found to continue is another question, but competent authorities are of the opinion that the chances are excellent. Williams Creek, which is adjacent, was one of the largest producers of the early placer mining days in the Cariboo and it is felt that, old story as it is, the owners of the claims in question are justified in believing that they have located one of the sources of the gold that was taken from the sands of the Creek bed.

Three years ago the first of the claims were located and called the "Independence." Shortly after eight claims were staked on the strike and named the "Imperial" Group. Since then prospecting has been carried on continuously on both, the work consisting of shaft sinking, cross-cutting and stripping, proving the continuity of the veins for a distance of 8,000 feet.

An account of the present situation from Barkerville, B.C., reads in part as follows:

"There apparently are too large main veins, about 300 feet apart, with a strike northwest and northeast. No. 1 vein appears to be about 28 feet wide and No. 2 about 14 feet. Nothing of a spectacular nature was discovered until August, 1918, when a number of openings were made on the "Independence" No. 2 vein. Here a remarkable body of ore was uncovered. Considerable free gold could be seen in the quartz and from the pan prospects it was evident that the veins which at this point was 14 feet wide would yield high values. Some of the holes were sunk 10 feet deep. Mr. J. D. Galloway, district government engineer, visited the property for inspection during the month of October securing sixteen samples and assay returns from the Department of Mines show an average value of $61.50 in gold per ton.

"About three weeks after the "Independence" discovery the owners of the Imperial group succeeded in tracing the vein north-westerly by following the strike and float some 4,000 feet. Here, by a crosscut, the vein was picked up again, with an average width on the surface of 9 feet. It yielded good pan prospects while clusters of free gold could be seen through the quartz. Mr. Galloway also visited this property. At the time the owners had made two crosscuts in the vein about 8 feet in depth about 500 feet further north. From the double crosscut Mr. Galloway took eight samples which yielded as follows: From a sample taken on the south side of the first cut, $6.10 from a 17-inch cross-vein, 15.25; from the north side of cross-channel, $24.30; from a sample of the sulphide in the bottom, 8 feet deep, $231.30; from adjoining cross-channel, south side, $16.40; from north side, across 9 feet, $28; grab sample, main dump, $21; grab sample, main dump, fine material, $11. From the single cut, Mr. Galloway took three samples, assaying as follows: Two cross-channel samples, $19.40 and $28; one of the sulphide, $112.40 in gold and $1.60 in silver per ton.

"Shortly before Mr. Galloway arrived a well-defined 20-inch cross-vein was discovered highly mineralized also carrying considerable galena. Assayed a sample yielded $16 gold and $8.30 silver. Since Mr. Galloway's visit the owners have built a shaft house and a 4 x 6 shaft to a depth of 24 feet 6 inches.

"The free gold values seem to increase to a depth of about 11 feet, when the ore commenced to go into an arsenical sulphide and at 15 feet all signs of surface oxidization disappeared. The vein widened from 9 feet at the surface to 12 feet at the 24-ft level with the dip slightly expanding both ways. The quartz apparently stands in seams or partings—mostly dipped and running with the vein. These seams are from about half-an-inch to an inch wide and are highly impregnated with arsenical pyrites, while the silica itself carries a fair amount of the pyrites. The owners have crosscut the vein at 24 feet and have taken a cross-channel sample from each side of the tunnel, which they have forwarded to the Mines Department for assay. Slow progress has been made sinking on account of the water, and work has been suspended for a time to allow it to subside."

To Investigate Smelter Rates.

It is announced that the first session of the Committee appointed to investigate the rates charged British Columbia Mine Operators for the treatment of their ore by the Consolidated Mining & Smelting Company at Trail, B.C., will be held on the 21st of January at Nelson, B.C. The personnel of this Committee follows: Mr. S. S. Fowler, Riondel, B.C.; Mr. Ivan de Lashmutt, Silverton, B.C.; and Mr. James Anderson, Kaslo, B.C. The British Columbia Government will be represented by Mr. A. G. Langley, Resident Engineer with headquarters at Revelstoke, B.C.

Crow's Nest Coal Miners Do Not Want Representation on Commission.

For several months the coal miners of the Crow's Nest Field have been working on the Single Shift System, a concession which was granted following the strike of last September, when the understanding was that a Royal Commission should be appointed immediately to make inquiry into charges that the mines of the district were unsafe to life while operated on the basis of two shifts to the twenty-four hours.

It now appears that the men, satisfied with present conditions, do not propose appointing a representative to the Commission, a course which, it was understood, they were to take, the personnel to be completed by appointees of the Crow's Nest Pass Coal Company and of the Minister of Mines. What course will be adopted as a result of this announcement is difficult to say; but it seems assured that the company will not be content to allow the situation to remain, because its management feels that two shifts does not affect the safety of the workings and that the continuance of the single shift very seriously affects the output and the returns of the property.

The decision of the men is explained in the following resolution adopted at a recent meeting of Gladstone Local Union (Fernie, B.C.) No. 2314, U.M.W. of A.:

"Whereas the result of Order 26 decreed that the mines at Coal Creek and Michel resume work on single shift for an indefinite period pending the report of a Royal Commission;

"And whereas our position is actuated by the question of greater safety of the mines only, it is then we view with great concern the probabilities of such a Commission, composed as it will be of men of lesser efficiency or repute in the mining world;

"And now whereas we, as members of Gladstone Local Union, did not seek or request that such expert services as that of the highest reputed authority on the

American continent, viz., G. R. Rice, of the United States Bureau of Mines, nor were we asked collectively or individually to give evidence as to conditions existing in this coal field, but such evidence was supplied exclusively by the Crow's Nest Pass Coal Company, and by the Department of Mines, nor were we informed of the conditions which led to the disastrous explosion at No. 3 Mine notwithstanding the fact that the Department of Mines had G. R. Rice's report of conditions on file, which report of conditions clearly shows the flash point should be reduced from 5.5 to 2.5 in those mines;

"And whereas, since the above mentioned disaster the withdrawal point has been changed from that of ½ inch cap to ¼ inch, which shows that the Department of Mines must have some faith in the Rice Report on which we based our argument;

"Now whereas all commissions that have been appointed to settle disputes between capital and labor have invariably been unsatisfactory to labor;

"Therefore be it resolved that we, the members of Gladstone Local Union, No. 2314 U.M.W. of A., absolutely refuse to take any part whatever in the aforementioned Commission."

Coal for Prince Rupert.

The securing of an adequate supply of coal at reasonable rates for the City of Prince Rupert, B.C., has been under investigation by the Council of that community. Mr. Nicol Thompson, Fuel Controller, was interrogated as to charges, and in his reply stated that it had been arranged when he visited Prince Rupert in October, 1917, that the price of coal should be made by the dealers at their wharf or shed, cost of delivery to be arranged with the purchaser. At that time it was figured that the price would be $10.50 a ton, but since then there had been advances,making the cast at the mines as follows: All coal mines on Vancouver Island, except the Western Fuel Co., $7.20 per gross ton; Canadian Western Fuel Company, $6.45 per gross ton. Mr. Thompson further explained that under the new regulations while the price at which a dealer might sell was not fixed, his profit was limited to 50 cents per net ton over all reasonable overhead charges. Mayor Gale, of Vancouver, wrote Prince Rupert that the retail price of coal delivered in sacks over the greater part of his City was $10.50 per ton of 2,00 lb. He added that Vancouver had the privilege under charter amendments secured two years ago to operate its own coal business, and it has actually supplied all civic and semi-civic buildings at actual cost, although the city has not gone into the coal business in the ordinary way. The Prince Rupert Council finally recommended the establishment of closed coal bunkers operating on a gravity system, in order to eliminate much of the labor now wasted in distribution; that coal be purchased by consumers in bulk as far as possible to avoid the extra 50 cents a ton cost for sacking; that a representative of the city be appointed to cooperate with the Provincial Fuel Controller for the regulation of supply and prices in the Northern District; and that Prince Rupert be given power under the Municipal Clauses Act to operate coal yards if it is found in the public interest that such a policy be adopted.

Will Develop Groundhog Anthracite.

The Groundhog Anthracite Coal Fields of British Columbia are to be developed according to responsible mining men. These deposits are situated north of the Hazelton District and contain eleven known commercial seams, aggregating about 68 feet in thickness. Interest in these measures is held by Sir D. D. Mann and the Lord Rhondda Estate. While active work was suspended during the war it is asserted that it will be resumed without loss of time.

International Coal and Coke Co., Ltd.

Mr. A. C. Flumerfelt, President of the International Coal and Coke Company, Ltd., with collieries at Coleman, Alberta, has issued a notice to shareholders requesting proxies for a change in corporation from the State of Washington to a corporation to be chartered under the laws of the Dominion of Canada. While the operations of the company are in the Province of Alberta, the company, being a United States charter, has to pay taxes in the United States, which are now costing between $1,200 and $1,500 per month, and as well pay taxes under the Canadian laws. By operating under the Canadian law the United States taxes will be eliminated. In view of the high prices the company is receiving for its product and development at the mine, together with the installation of by-product coke ovens, the company is enjoying considerable prosperity and is rapidly increasing its financial strength. Two dividends amounting to three per cent have been paid to the shareholders during the year.

Vancouver Chamber of Mines.

At the annual meeting of the Vancouver Chamber of Mines, which was held recently, it was decided that an international mining convention would be held in the Province, under the auspices of the organization, sometime during the year. Nothing was done as to the fixing of a date, but the consensus of opinion was that it was important that the assembly should be made thoroughly representative of British Columbia, and of the Pacific Coast States. Officers were elected as follows: Hon. President, Hon. Wm. Sloan, Minister of Mines; Hon. Vice-Presidents, Senator Shatford and Mayor Gale; President, A. M. Whiteside; Vice-President, Lieut.-Col. E. G. Prior, Victoria, B.C., and C. E. Cartwright; Hon. Treasurer, J. M. Ley; Executive, Messrs. N. Thompson, G. T. Hodge, R. H. Stewart, J. M. Turnbull, S. J. Crocker, G. S. Pettipiece, I. Thomas, S. N. Miller, J. D. Kearns, H. P. McCraney, F. E. Woodside, B. G. Hawkins, W. E. Bland, A. B. Buckworth and G. S. Eldridge.

As a result of a recent inspection of the Cassiar Crown Copper Company's property, situated on Grouse Mountain near Telkwa, B.C., it has been decided to drive a new tunnel about 90 ft., with a view to tapping the vein at about 75-ft. depth, drifting from there on the ore. This vein shows up strongly on the surface, being fourteen feet wide and traceable for a considerable distance. Should the present indications be confirmed by further development, the owners propose installing a modern plant for the handling of the output. The copper contents of the ore constitute its chief value.

Mr. W. M. Sutherland, well-known in British Columbia as a prospector and mining operator, died recently at Revelstoke, B.C. He was interested with Mr. J. B. Tyrrell, of Toronto, Ont., in the development of the Golden Wonder Group of Claims on Rocher de Boule Mountain near Tramville. In the early days the late Mr. Sutherland was engaged in mining in the Yukon where he first became associated with Mr. Tyrrell.

The Canadian Graphite Industry

(From Summary Report, Mines Branch, 1918.)

By HUGH S. SPENCE.

With the object of collecting data for a new edition of the Mines Branch report on graphite, published in 1907, and which has been out of print for several years, the writer visited the graphite mines and mills in the Provinces of Ontario and Quebec. The graphite occurrences in these Provinces constitute the source of supply of all the graphite that has been produced in Canada in recent years. All the properties lie within a radius of 150 miles of Ottawa.

An attempt to exploit graphitic shales near St. John, N.B., was made many years ago, and a production was reported from that locality by the Canada Paint Co., as late as 1896. These shales carry a very finely-divided, amorphous graphite: a grade which is only suitable for pencil making, paints, or foundry work. Similar graphitic shales are known, also, from various other places in New Brunswick, as well as from Nova Scotia.

In British Columbia, disseminated graphite is reported to occur at Alkow harbour, Dean channel, and near Harrison lake. A vein of amorphous graphite near Marysville, Cranbrook district, was examined by the writer in 1916, and was reported on in the Mines Branch Summary Report for that year. None of these graphite occurrences have been exploited to any extent, though a small trial shipment is reported to have been made from the Harrison lake property; and a shallow prospect pit has been put down on the Marysville vein. The latter is only 18 inches wide, and consists of a mixture of silicates and amorphous graphite, the carbon content being about 25 per cent.

The shortage of graphite experienced in the United States during the last three years has been caused by the greatly increased consumption in the crucible manufacturing industry; shipments of Ceylon graphite—which is the grade preferred for this work—being insufficient to supply the trade. The demand for flake graphite has resulted in a great increase in mining activity in the United States, and a brisk demand has been experienced for Canadian flake. In spite of this, however, the adverse conditions which have long hampered the graphite industry in this country still persist, and during 1917 only three companies operated at all steadily, there being nine mines, each equipped with a mill, that have been either completely idle or in only intermittent operation. Various causes have conduced to this state of affairs, among them being: (1) failure to devise a proper concentration process for the particular ore to be treated; (2) erection of mill without sufficient care being taken to establish the existence of an adequate ore-body, which sometimes resulted in ore having to be hauled to the mill from outlying pits, and (3) remote situation of the property, necessitating an expensive road-haul for fuel and supplies. In several instances, large expense was incurred in the erection of a mill out of all proportion to the size of the ore-body—as subsequently developed. The power-consumption alone, in such a mill, using as fuel, wood or coal, which has to be brought a considerable distance, is a factor that has conduced to the lack of success attending operations at certain of the properties. In this connection, it may be noted that of the two active mills running on disseminated flake graphite ore, one is using oil as fuel, and the other is operated by water-power.

The flake graphite occurs in disseminated form either in crystalline limestone (Haliburton and Hastings counties, Ontario) or in more or less calcareous bands intercalated in gneiss (Buckingham district, Quebec), the latter ore as a rule carrying more graphite (10-15 per cent) than the limestone, which averages 7-10 per cent. Both varieties of ore carry flake mica, pyrite, pyrrhotite, and lime silicates, as the principal accessory minerals; and both have been treated by essentially similar concentration methods. These are, briefly, drying in wood-fired kilns; reducing in gyratory crushers followed by two or more sets of heavy rolls; and subsequent alternate screening and crushing in rolls of the flour-mill type. Each set of rolls eliminates gangue by reducing the brittle calcite and silicates to powder, while the soft graphite tends to flatten out and is caught by the screens. The produce from the final set of rolls is sometimes polished between buhr-stones, or goes to an electrostatic machine, which removes any remaining impurities, particularly mica; the latter is one of the most difficult minerals to get rid of, owing to its softness, and consequent resistance to crushing. In the early days of the graphite industry, a wet process of concentration, employing buddles, was practised. This method is still in use at one mill, as the initial step in concentration, followed by drying; the dried product then proceeding to rolls, screens, and buhr-stones.

One of the most recently constructed mills practises wet concentration by means of tables and hydraulic classifiers, followed by drying in a vacuum filter and kiln, and polishing between rolls. Good results are obtained in some mills, also, by the use of dry tables.

Concentration by means of water flotation, such as is in general practice in the mills of Alabama, U.S.A., is not employed at any mill in Canada.

While certain of the mills achieve a fair recovery of the graphite contained in the ore treated, the majority lose an undue percentage in the tailings. The concentration methods in general use are far from being efficient. In addition to poor recovery, the carbon content of the best, or No. 1 product, is seldom brought over 90 per cent, and is generally lower; a great deal of the flake in the rock is broken up in the milling, and goes into the smaller mesh No. 2 product, and to the No. 3 or dust; while the large amount of dust produced in the mill in grinding the kiln-dried ore is very objectionable. Screen tests on samples of No. 1 flake from seven mills showed the mean percentages of different size flake composing this grade to be as follows:—

+ 20 mesh	1.76	per cent.
+ 40 mesh	18.56	”
+ 60 mesh	67.00	”
+ 80 mesh	8.06	”
+ 100 mesh	1.10	”
— 100 mesh	2.96	”
	99.34	”

Most mills produce three grades of graphite, known as No. 1 flake; No. 2 flake; and dust. The No. 1 flake goes principally to the crucible trade; No. 2 is employed in lubricating products; and No. 3, or dust, is used in foundry work.

The graphite particles employed in crucible manufacture are required to be of a certain size, in order to bind efficiently with the clay. In this connection it may be noted, that one of the reasons for the preference for Ceylon graphite for use in the manufacture of crucibles is, that this variety does not occur in thin flakes like the American graphite, but is more massively crystalline, and breaks up on crushing into more angular fragments, hence requires less clay as a binder.

OBITUARY

M. W. SUTHERLAND.

On the 3rd of January last Murdoch W. Sutherland Miner and Prospector, passed away quietly in Dr. Winch's hospital at Hazelton, B. C.

Born in Western Canada of Scottish parents, his childhood was spent on a farm near Edmonton in Alberta and when but a young man he spent a year or two at Jasper House on the Athabasca river, trapping fur-bearing animals, and trading for furs with the Indians.

When gold was discovered in the Klondike he was one of the first to cross the mountains to the new Eldorado. After his arrival in the city of Dawson he spent some months prospecting for himself, and then engaged with Mr. J. B. Tyrrell on Hunker Creek first as miner and subsequently as foreman. Afterwards he took a lay on one of Mr. Tyrrell's claims and worked it carefully and economically with a fair measure of success.

About 1904 or 1905 many miners left the Klondike for the new diggings near Fairbanks in Alaska and Sutherland was one of the number. There he worked a lay on a claim on Cleary Creek, and through his force of character and ability in handling men, and with the experience in placer mining gained in the Klondike, he was so successful that he realized a small fortune. Then others recognized his efficiency as a manager, and made him flattering offers if he would

THE LATE M. W. SUTHERLAND,
In camp north-east of Hazleton, B. C.

undertake to manage their properties, but he loved independence and now that he had money at his command he decided to visit South America and examine some of its placers. Not finding anything attractive there he returned to Edmonton, his old home, where he engaged in the grain business for a short time.

From there he turned to Northern British Columbia where most of the remainder of his life was spent prospecting in the mountains and developing some of the prospects that seemed most attractive to him.

He belonged to that rare type of independent fearless men who love the forests and mountains and are at home anywhere in the wilderness, but who at the same time must always be engaged in active work of some kind, and whose chief joy is in discovering and developing the resources of the wilderness and making it contribute to the needs of civilization.

He was gifted with keen sight, and having a clear enquiring mind he was a careful and accurate observer. Self-reliant in the face of difficulties he had learned that by immediate attention and hard work he could overcome almost any obstacles that might present themselves, and being strong and tireless he did not know the meaning of rest, except as a preparation for more work.

Almost energetic either at work or play, he had no sympathy for men who were idling their time away, either in the wilderness under the name of prospectors, or in the mines under the name of miners. Nevertheless, he was one of the kindest of men, and if a man was doing his best, however poor that best might be, he was ready to assist him, and if a man was in distress he was anxious to help him. In fact, he would give his last dollar to anyone whom he knew to be really in need. From his own experience and observation he knew how much work a man should be able to do, and men working for him knew that he knew, so that he had no difficulty in obtaining willing and efficient labor.

Such men as Sutherland can ill be spared in Canada where honesty, intelligence, strength and fearlessness are the main elements of success.

Personals

Mr. R. J. Ennis, manager of the McIntyre-Porcupine mine went to Toronto on business, early in the week.

Mr. W. E. Simpson, consulting engineer for the Miller Independence is in Sherbrooke, Que., on business.

Mr. B. E. Neilly, of Cobalt, will be elected vice-president of the Canadian Mining Institute for the coming year.

Mr. A. Wende, manager of the Wright-Hargreaves mine, of Kirkland Lake has returned to Buffalo after a business visit to the mine.

Mr. Harry Stewart, manager of the Crown Reserve mine is in Montreal this week, where he attended the annual meeting of the company, held on Wednesday.

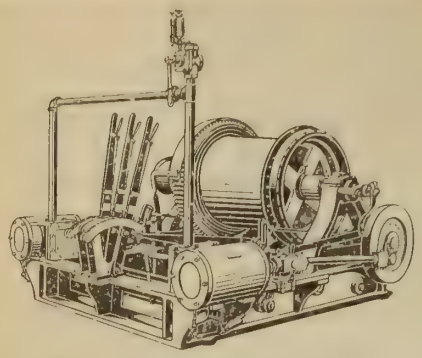
Mr. S. G. Blaylock, assistant general manager of the Consolidated Mining & Smelting Company of Canada, has returned to Trail after a business trip to the East.

Thomas Goard, a pioneer prospector and miner of the Revelstoke, Illecillewaet, Slocan and Lardeau Districts of British Columbia, died recently at Revelstoke.

Mr. Harry Oakes, president of the Lake Shore mine, went south early in the week to attend the annual meeting of the Tough-Oakes Gold Mines, held Wednesday in Toronto.

The following will be elected by acclamation councillors of the Canadian Mining Institute: Robert A. Bryce, Toronto; Geo. Gillespie, Madoc; E. T. Corkill, Copper Cliff; C. E. Smith, Ottawa.

Mr. George J. Miller, president of the Miller Independence mine at Boston Creek went south to Dayton, on Wednesday, and while there will attend the annual meeting of the company to be held early in February.



Made in 7 sizes, from 10 to 50 H.P., and with any diameter Drum up to 48 ins.

MINE HOISTS

We make our Mine Hoists to suit you and your mine.
We make them with one Drum, or with two Drums, and with any diameter Drum you require, up to 48" at bottom of the flanges.
We make them for Steam Drive, as shown, or for Electric Drive, or for Belt Drive.
We can give you a little 10 H.P. Hoist for prospecting, or for small mines, or a large 50 H.P. Machine for the deeper Mines. We can also give you a choice of 5 sizes between these two, so no matter what the size of your Mine, we can make you a Hoist to suit.

Established 1846
Sales Agents: Mussens Limited, Montreal, Winnipeg, Vancouver

U. S. MINERAL OUTPUT.

The value of the minerals produced in the United States in 1917, according to the United States Geological Survey, Department of the Interior, was $5,010,948,000, an increase of $1,496,976,000, or about 43 per cent, over the former record—$3,513,972,000—established in 1916. The blast furnace products (pig iron and ferro-alloys), copper, coal, and petroleum contributed 74 per cent of the total value of minerals produced and 88 per cent of the increase in 1917.

The metals established a new record in 1917, being valued at nearly $2,092,000,000 and representing 42 per cent of the total value of the mineral product. They showed an increase of about $471,316,000, or 29 per cent, over the $1,620,508,000 reported for 1916. The blast furnace products contributed nearly 90 per cent of the total increase. Increases were also made in the value of aluminum, copper, lead, and silver, but decreases were recorded in the value of gold and zinc.

The value of the non-metallic products in 1917 was 58 per cent of the value of all minerals produced, increasing $1,010,459,000, or nearly 54 per cent, from the former record of $1,878,464,000 in 1916 to $2,888,923,000 in 1917. Of this total increase coal alone represented nearly 66 per cent, and coal and petroleum combined contributed about 85 per cent.

Dr. C. K. Leith, head of the Department of Geology in the University of Wisconsin, and well known in Northern Ontario, recently sailed for France to act as Mineral Adviser for the United States Peace Commission.

The Canadian Wire & Cable Co., Ltd., is installing machinery for the manufacture of a full line of wire rope in the plant at Leaside. It will be in operation March 15th. The company will then be in a position to supply all kinds and sizes of steel wire rope.

Mr. Elwyn G. Blacklock, assistant general manager of of the Consolidated Mining and Smelting Company of Canada, and Miss Kathleen Riddle, of Danville, Quebec, were married on Tuesday, December 31st last at the Congregational Church, Calgary, Alta. Mr. and Mrs. Blaylock will reside at Trail, B.C.

Dealers in Railway and Power Plant Machinery
BANK OF HAMILTON BDG., TORONTO

"ORTHACLASE" FELDSPAR—I have the finest grade of "Orthaclase" Feldspar and lots of it. Close to railway. Open for orders in any quantities. Car lots preferred.—P. J. DWYER, Wilberforce, Ont.

FOR SALE

1 4x8 Marathon Mill, with 7 tons of grinding rods from 5/8 to 1¼ in. diameter, and 7 tons extra 1¼ in. rods. The delivery of this mill was too late for the purpose for which it was bought, so it has not been used.

1 12-in. x 15-in. two-drum Jenckes Tandem Hoist, with one 20-in. auxiliary drum and one nigger-head mounted on the shaft extension. Second-hand, but in good condition.

1 Steel Mast, 11 x 17 inches, 45 or 60 feet long, equipped with all sheaves, foot castings and swivel top piece for 12 guy wires.

1 1 cu. yard Mansfield back dump Excavator Bucket, second hand.

EDITORIAL

MINING ENGINEERS AND WAR WORK.

The part that mining engineers have played in the war is well indicated by an article by Mr. F. F. Sharpless in a recent number of the "Engineering and Mining Journal." Aside from the work of producing the raw materials for munitions, the mining industry has furnished men for many important duties, besides those that are purely military. Needless to say, mining engineers and miners have proven to be excellent and versatile soldiers and transportation officers. They played a big part on the battlefields in France and Belgium. Used to hardships and to overcoming difficulties promptly as they present themselves, they were not easily disconcerted. On the firing line and behind it, in tunnelling and in transportation, they helped to make the Canadian army second to none.

At home as well as at the front, mining engineers have distinguished themselves. Chief among these is Herbert C. Hoover, an American mining engineer, who was in London when war broke out. The story of those days is told by Mr. F. F. Sharpless, who writes:

Upon the declaration of war between Germany and the Allies, the chaotic situation produced among the tourist population, which we may now recall with some mirth, developed almost over night. London found herself the rather unwilling harborer of many a shipwrecked traveler, men and women without home, food, shelter, or friends, and with nothing in their pockets that resembled real money. Willing as they were, the American consulates and the Embassy found themselves overwhelmed with the care of a disorganized horde of scared women and brainless men. The American Ambassador, in this emergency, thought of an American, well known in London for his capacity and executive ability. He called up H. C. Hoover and asked if he would lend his assistance. He would; and within a few hours Hoover had organized a force, the members of which were busy in financing and moving, in orderly manner, this crowd of lost or strayed Americans.

"Hoover was a mining engineer; his relief organization was chiefly of engineers, most of them mining engineers. They were selected not *because* they were mining engineers; they were selected because they had had experiences fitting them for handling any sort of unexpected human, physical, or financial trouble. Many of them had themselves been stranded, lost in darkest Africa, near death's door in half a dozen places, and had tackled and handled successfully much worse situations than the feeding and shipping of a lot of stray sheep in a place where there was plenty of food and lots of shipping. Hoover's assistants were chosen for their ability; it only happened that they were nearly all mining engineers.

"This work having been finished so successfully, it was only a short time until another big organization problem presented itself, one of vast proportion and of complications scarcely conceivable at its inception—the relief of the Belgians. Without a moment's question this stupendous task fell to Hoover, the mining engineer—a task involving problems of commerce, finance, and diplomacy all conducted under most unfavorable conditions. Again Hoover called for suitable help, and again he found it largely among the mining engineers, men who had met unexpected situations and acquitted themselves with credit. An English critic of the work describes it as "the formation of the largest and most successful grocery business in the world, and it was done in less than six months." This success in Belgium was in no way due to official support from the United States. Indeed, not only were moral and financial support lacking from our Government, but the members of the commission were instructed to get out of the country, instructions that were reluctantly and slowly followed."

We need not dwell further on Hoover's work; it is too well known. As most of our readers well know, the mining engineer is very often in a position where he must provide for the wants of large numbers of men in places and under conditions that would discourage most people. He has often to be a pioneer and then the father of a large community. He soon learns to take more interest in humans than in machinery. Consequently we were not surprised, though very pleased, when we learned of Hoover's work. Nor were we much surprised to read in the newspapers this week that Col. J. W. Boyle is in charge of the work of feeding Roumania, and that he is arranging to purchase food in Canada. Col. Boyle is president and manager of one of the biggest gold mining concerns operating in the Yukon.

Next to feeding the starving, one of the duties of most human interest is that of caring for disabled soldiers. Here too we find mining engineers taking a large part. The difficulties confronting those who took up this work in Canada attracted the attention of a Canadian mining engineer, Mr. W. E. Segsworth of Toronto. Mr. Segsworth's endeavor to assist returned men to qualify themselves for good positions in industry and to see that they were given preference by employers, led to his being appointed Administrator of Vocational Training. During the past two years he has devoted all his energies towards helping the re-

turned soldiers, especially the disabled. As a result, he has seen the Vocational Training work in Canada develop into one of which the country can well be proud. The story of this work has not yet been widely told; but those who are close to it know that in this, as in the battlefield, Canadians are leading the advance. Mining men are naturally pleased to see that a mining engineer is taking such a large part in this work. Needless to say, he has among his helpers many mining men. His chief aid in Ontario is H. E. T. Haultain, who is professor of mining in the University of Toronto, and who devotes about twenty hours a day to his work as Vocational Training Officer for Ontario. Like Mr. Segsworth, he receives no salary. Those of our readers who attended the National Exhibition in Toronto last September and saw the exhibit put on by the Department of Civil Re-establishment, will have some idea of the earnestness of the soldiers who are being helped to get back into civil life by such men as Segsworth and Haultain. We look forward to seeing similar assistance given by the Government to disabled men of all classes. These mining engineers will not be satisfied when they have returned to industry all disabled soldiers. They have started something that will doubtless result in more thorough training for industry of all classes of young men. We may be pardoned for claiming that the mining industry is contributing something besides minerals and metals to Canada's welfare. Segsworth and Haultain are doing work of very praiseworthy character, and they are accomplishing much more than is yet generally known.

THE RELATION BETWEEN IGNEOUS ACTION AND CRUST MOVEMENTS.

There are few who are so well qualified to write on the subject of igneous activity and igneous rocks as is Dr. Alfred Harker. There has recently been brought to our attention a copy of Dr. Harker's presidential address delivered at the anniversary meeting of the Geological Society of London, last year. He discusses particularly igneous activity as recorded in the rocks of Great Britain, and he does not dwell on the economic importance of his observations. His remarks contain, however, suggestions that may assist in the unraveling of the history of ore deposits, and thus give some assistance to those who search for ore.

In his address, Dr. Harker devoted his attention particularly to the relation between igneous action and crust-movements. In the study of the structural features of ore deposits there has been a tendency to deal with these phenomena as independent. As Dr. Harker points out, "the link connecting these two classes of effects is found in. The consideration that both afford relief to the unequal stresses which are continually being set up in the earth's crust by causes regional as well as cosmic."

Dealing particularly with observations in the British Isles, Dr. Harker states that the whole geological history of Britain can be viewed in relation to three cardinal events—the three systems of crust movements which at widely separated epochs contributed largely to the building of the country. "Each great system of crust movement has been attended by a display of igneous activity, related to it in a manner which clearly bespeaks some underlying law of causation. There is in each case evidence of extensive platonic intrusion within the disturbed area, either at the crisis of the disturbance, or following it after no long interval by geological reckoning. These copious intrusions of magma, no part of which reached the surface, are not only events of the first magnitude, but seem to differ functionally from the igneous action which characterizes other stages of the cycle. This more diffused activity, taking the form of extrusion as well as intrusion, is developed during the gathering of crustal stress before the critical epoch, and again especially in the later waning stages. It has many features suggesting that the several episodes which can be distinguished have their proper places in an ordered sequence. When there has been igneous action during a season of relative quiescence, this, too, has its own significant characteristics. . . . We shall not, however, appreciate fully the relation between igneous action and crustal stress, unless we have regard also to the petrographical facies of the rocks erupted at different phases of a complete cycle. It is becoming increasingly evident that magnetic differentiation is closely bound up with progressive crystalization, the essential factor being a separation, or partial separation, effected between the crystaline and the fluid portions at one stage or another of the process."

In support of his hypothesis that "the distribution of crustal stress is a dominant factor in determining the petrographical facies of igneous rocks," Dr. Harker gives a brief survey of igneous activity in Britain. He endeavors to show that, at different periods of its history, that area has been differently mapped out into petrographical provinces, and this in a manner quite definitely related to the larger displacements of the earth's crust.

Of peculiar interest to Canadians are Dr. Harker's observations on the pre-Cambrian rocks. He says of the oldest rocks in the Scottish Highlands: "The rocks are of calcic facies, like all other rocks intruded in close connection with powerful lateral thrust. In the South-Eastern Highlands especially it is clearly seen that the earliest intrusions of magma preceded the climax of the disturbance, so that the basic members of this rock-series met the brunt as rocks already solid; while the later and more acid magmas were intruded near the height of the mechanical disturbance and during its decline."

The average reader will be little interested in Dr. Harker's address, and some may wonder why we have devoted space to it here. We do so because we believe that Dr. Harker's work is likely to be of no little value to those who study the geology of our ore bearing areas. He sees order and sequence where the average observer sees only a complicated assemblage of rocks. Many of

our ore deposits are in pre-Cambrian areas, in rocks whose history it is not easy to decipher. Dr. Harker's words suggest that a fuller understanding of the geology of pre-Cambrian areas will come with research. When the larger geological features are better understood we may expect to read more accurately the history of our ore deposits. When this is possible we will have more reliable guides for those whose work it is to find ore. We wish Dr. Harker every success in his researches. He has remarkable ability in interpreting the history of rocks, and if he continues to work along the lines indicated in his address, we may reasonably expect him to offer many suggestions that will help and encourage his fellow workers and which will eventually be of value in the development of our mineral deposits.

REPLACING COKE BY COAL.

In this number we published an article by Mr. W. L. Wotherspoon on the experimental work in connection with the use of powdered coal in blast furnaces. The work at the Copper Cliff smelter is likely to prove of international interest. Owing to the constant demand for metal, it has not been possible to interfere very much with the steady operation of furnaces, and the experiments are not yet completed. Sufficient success has, however, been attained to warrant the claim that another big advance in metallurgy has been made.

ANNUAL MEETING, A. I. M.E.

International co-operation in mining in North America will be one of the principal topics to be discussed at the 119th Meeting of the American Institute of Mining Engineers, to be held in New York, February 17th to 20th. In the course of the Convention two joint sessions with the Canadian Mining Institute and one joint session with the American Institute of Electrical Engineers will be held. A number of prominent members of the Canadian Mining Institute will be present.

Improving the relations of capital and labor and the possibility of a uniform mining law for North America will be among the principal subjects which the Canadian engineers will discuss with the American Institute. Many of these topics will deal with after-the-war problems of great significance to American business. Three of the four days of the Convention will be devoted to business and technical sessions with entertainment features in the evenings, and the fourth day will be given over to an excursion to the Federal Shipyard at Newark Bay, where the first electric-welded ship is being built. The subject of electric welding is one of the principal ones to be taken up by the American Institute of Electric Engineers in joint session with the mining engineers on Wednesday, February 19th.

Some of the social features of this year's meetings will be: An evening entertainment; visit to the Metropolitan Museum of Art and Senator Clark's Art Galleries; a Matinee; a Reception of the President and the Annual Banquet.

REPORT OF ADVISORY COMMITTEE IS CRITICIZED.

Vehement condemnation of a report credited to the British Columbia Advisory Committee for Scientific and Industrial Research regarding the possibility of the successful establishment of an iron and steel industry in this Province is contained in the daily press and in the comments of public bodies. The report's general conclusion is that there is room for one large plant provided that it is assured of the whole Pacific coast market, but that conditions of manufacturing and market preclude under present conditions the establishment of more than one plant. But the report is also quoted as saying—and this is what is vigorously objected to—that "there does not seem to be, however, much likelihood of the iron and steel industry ever being developed on the Pacific coast to any large extent." In view of Dr. Alfred Stansfield's finding that there apparently is plenty of magnetite ore of the necessary purity for use in electro-smelting; in view of the special interest which the Provincial Government and Hon. Wm. Sloan, as Minister of Mines, is taking in the development of the iron ore resources of the Province; and in view of the general feeling among the business men of British Columbia that the initiation of an industry which will utilize the iron deposits now idle, and which while as yet unexplored are believed to be very extensive, it is felt that the latter statement in particular is absolutely unjustified. At a recent meeting of the Vancouver Board of Trade one of the members of its Council, Mr. George Kidd, who also is a member of the Advisory Committee for Scientific and Industrial Research for British Columbia, was requested to furnish information on the investigation conducted by the committee with regard to the establishment of an iron and steel industry in British Columbia. The report, in the opinion of members of the Council, was not in keeping with the facts as disclosed by investigations made by mining experts. A Vancouver newspaper wants to know who the members of the Advisory Committee are, and by what right it undertakes to say that "there is not much likelihood, etc." It adds: "Surely it is not the business of government employees to go out of their way to gratuitiously belittle the prospects of any section of the Dominion."

May Develop Copper Deposits on Ecstall River.

Reports are current that the Granby Consolidated Mining & Smelting Company proposes to develop the copper deposits of the Ecstall River, Northern British Columbia, which were prospected last season, and which are said to be most promising, on quite an extensive scale. Rumor has it, and it is given for what it is worth as such, that the company contemplates establishing a smelter at some point on the sea coast opposite the aforementioned deposits, and that a route from the property to the suggested site has been surveyed.

Mr. N. J. Everett, former manager of the Porcupine V. N. T. Mine of Porcupine, has taken over the management of the Davidson gold mine, succeeding D. Sloan, who, for a considerable time, managed the Davidson.

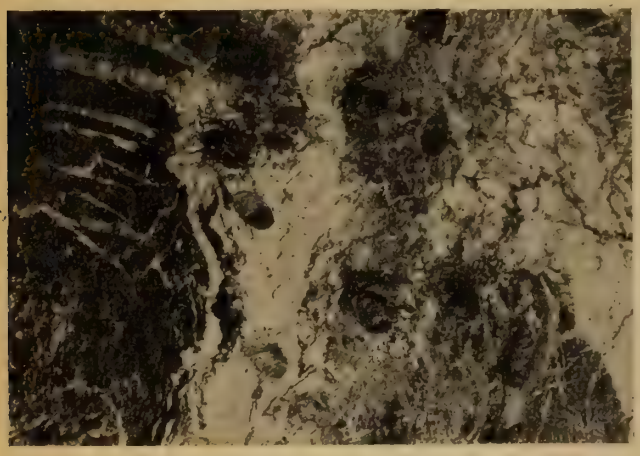
Larder Lake Gold Area

By PERCY E. HOPKINS.*

During the first week in October, 1918, the writer examined the working properties at Larder Lake. Since little has been published recently on the area, a brief history and geological summary of the camp may not be out of place. The properties, which are being worked, and a newly-discovered pyrite deposit, will be described, and mention will be made of the hydro-electric development.

History.

Larder lake lies 18 miles by wagon road east of Dane station at mileage 160 on the Temiskaming and Northern Ontario railway. The finding of gold at Larder lake in August, 1906, by Dr. Reddick, caused a rush of prospectors to the area during the following winter of 1906-07, when a few thousand claims were staked. The Larder Lake Mining Division was formed, and J. A. Hough appointed Mining Recorder at Larder City in June, 1907. Development following the "winter stakings" resulted in much disappointment, as is often the case, and finally most prospectors left the area, and the recording office was moved, in March, 1911, to Matheson. Desultory mining has been carried on at two or three properties since. The total gold production is in the neighbourhood of $25,000, coming from the Associated Goldfields (Harris-Maxwell), Mine d'Or Huronia and Reddick.



Face of Drive on 500 ft. level, in ore containing visible gold. Harris-Maxwell property, Associated Goldfields, Ltd.

Gold Bearing Quartz Stringers in Dolomite.—Open pit on Harris-Maxwell property. Associated Goldfields, Ltd.

Literature.

In 1901 Willet G. Miller,[1] Provincial Geologist of Ontario, passed through Larder lake, then called Lake Present. In 1903, W. A. Parks,[2] of Toronto University, described the geology along the chief waterways of the area. In June, 1907, R. W. Brock,[3] who afterward became Director of the Geological Survey of Canada, examined and reported on an area in the vicinity of Larder lake for the Ontario Bureau of Mines, this report being accompanied by a geological sketch map. His assistant, N. L. Bowen,[4] continued geological work during the remainder of the summer and published a more detailed map and a brief report. M. E. Wilson,[5] spent 1908 and 1909 in the area, and published detailed maps and reports. In September, 1915, A. G. Burrows[6] examined La Mine d'Or Huronia and a part of Gauthier township.

Geology.

The geology of Larder lake is similar to the pre-Cambrian in many other parts of Ontario. The oldest rocks are dominantly volcanic and consist of greenstones and green schists. Associated with them are sedimentary bands of ferruginous carbonate, iron formation, slates, and conglomerate, with an almost vertical dip, which have their greatest development along the north shore of Larder lake, and are traceable westerly to Kirkland lake. The rusty-weathering carbonate is intersected by quartz and calcite stringers which carry most of the gold in the area, and hence will be mentioned in greater detail. Cutting the above rocks are porphyry and aplite tongues, presumably from the large granite batholith to the southeast. Resting unconformably on all these rocks are erosion remnants of conglomerate, greywacke and arkose of the Cobalt series. The diabase and gabbro dikes represent the latest ingenous activity, and are the youngest rocks of the area.

Rusty-weathering Carbonate (Gold-bearing Formation.)

Rusty carbonate rocks are found in or near many of the gold areas of northern Ontario. They are, however, more widely distributed in Larder lake than elsewhere, and important since they appear to contain a greater quantity of gold than the other rocks of the area. Gold, however, does occur in aplite on the Gold King, and in the porphyry and green schists of La Mine d'Or Huronia. Hence it is believed that the gold is related to these aplite-porphyry intrusions and, therefore, indirectly to granite. These rusty-weathering carbonates are in places dolomites which occur in bands up to 300 or more feet in width. They

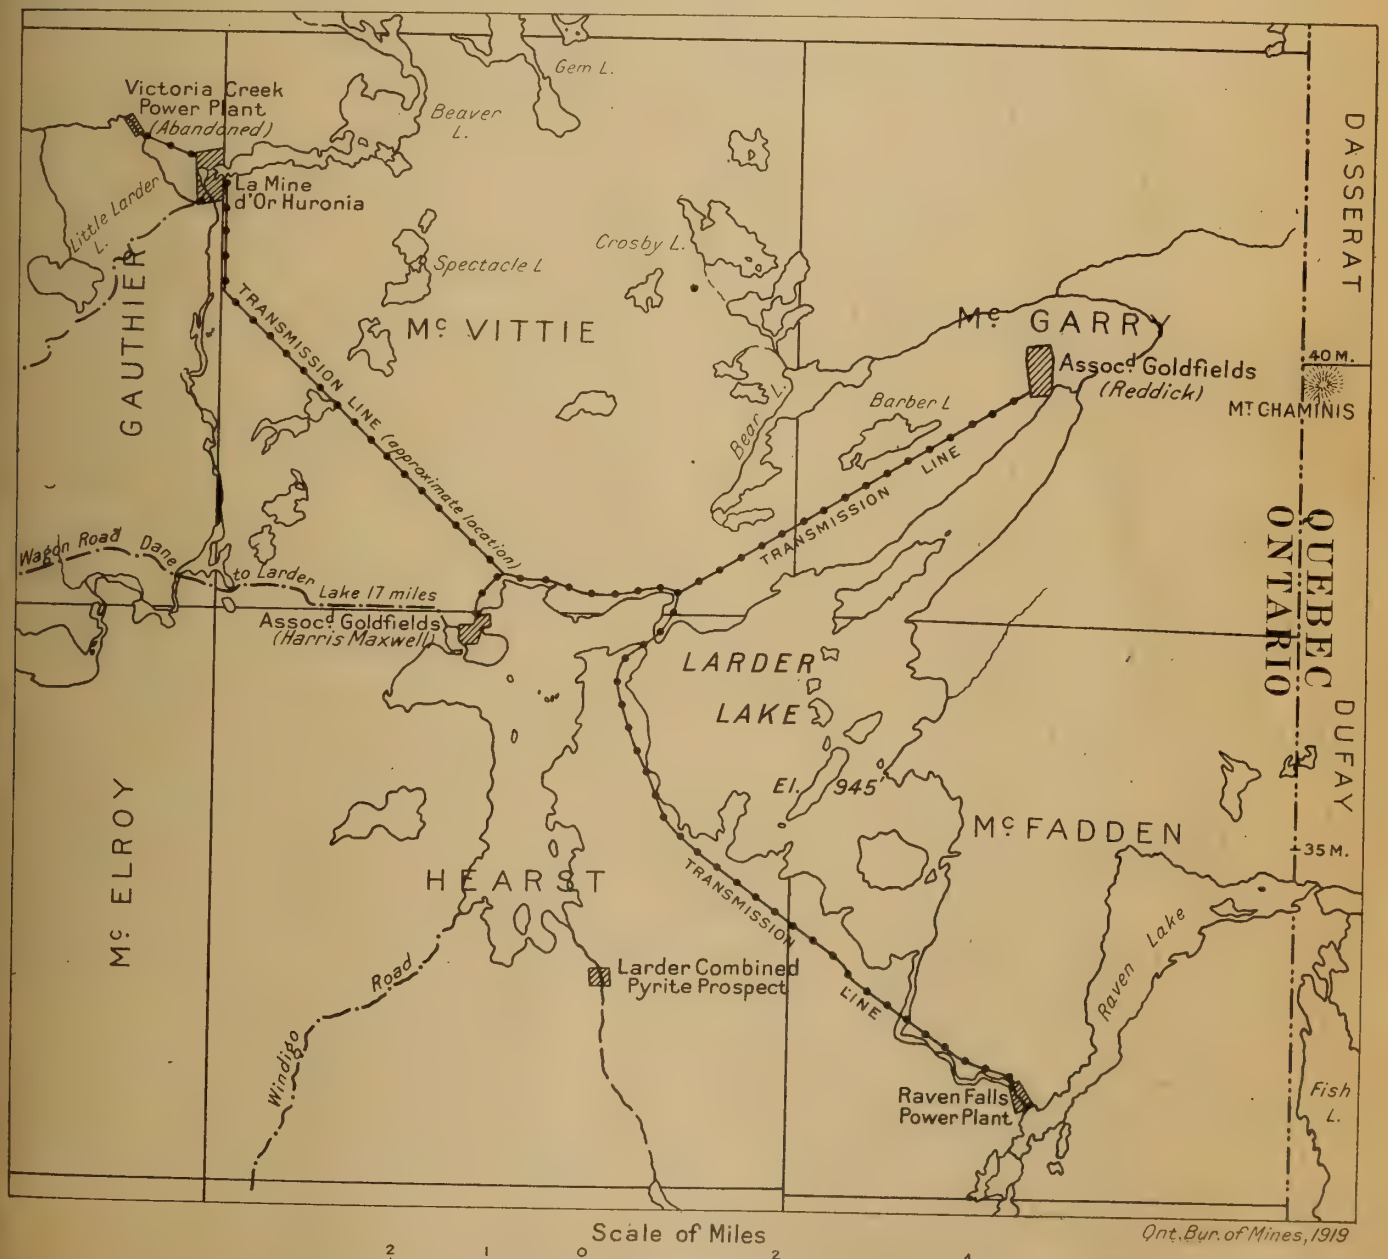
are usually brown in color, but often large parts of them have been altered to green fuchsite or mariposite, serpentine and talc. They are intersected by a network of quartz and calcite stringers, which in places carry low gold values over wide widths, and frequently small ore shoots or spectacular gold showings. Although this association of rocks and mineral solutions does not form ore in many parts of the world, still it resembles somewhat the ore bodies on the Rawhide mine, southeast of Angels Camp, California. Small, medium-grade ore shoots do occur, as on the 83-ft. level of the Reddick and 500-ft. level of Harris-Maxwell, but they are isolated, with little to indicate where they will be found, and what will be their extent. The passing from ore into barren material is known only by the disappearance of visible gold and low assay values, and not by a charge of formation. Since the known richer shoots are small and scattered the success of mining will depend upon the working of a large tonnage of low-grade ore, which will necessitate much capital and very detailed mining. Electric power being available, a careful systematic surface sampling can be made of large areas of mineralized dolomite at a reasonably small cost, with the view of locating low grade ore over considerable widths. Air pipes could be extended across such areas, and hand plugger drills used to sample the dolomite at an inch or so below the oxidized surface.

Associated Goldfields.

The Associated Goldfields Mining Co., Ltd., is operating Block "B" and Block "D" formerly known as the Harris-Maxwell and Reddick respectively. Power is supplied from their own hydro-electric plant at Raven falls, all three properties having telephone connection. In addition the company has a telephone line to Dane station. The president of the company is Geo. A. Mackay, with head office at 306 C.P.R. Building, Toronto. C. G. Dampreé is general superin-



The Larder Lake Gold Area.

tendent, and D. A. Anderson electrical engineer. The writer is indebted to these gentlemen for courtesies extended him.

Raven Falls Hydro-Electric Power Plant.

The power station is situated on Raven lake, at the entrance of Raven river. Larder lake serves as a storage basin. The water is fed by a flume 6 ft. in diameter and 1,280 ft. long, and the turbines operate under a head of 6 feet. According to A. R. Webster, Mining Inspector for Ontario Bureau of Mines, two horizontal turbines of 800 H.P. each run two 700 K.W. generators. The voltage is stepped up from 2,400 to 13,200 through three transformers of 300 K.W. each. Power is then transmitted 7¾ miles to "the Narrows" on Larder lake, where the line divides, one branch going 4½ miles northeasterly to the Reddick and the other 2½ miles westerly to Harris-Maxwell and an additional 5½ miles northwesterly to La Mine d'Or Huronia, making in all about 21 miles of transmission line (three phase, sixty cycle) as shown on the accompanying sketch map. At the Reddick the voltage is stepped down to 2,200 through two 150 K.W. transformers. Here a 225 H.P. motor drives a compressor of 2,000 cu. ft. capacity. The branch line to the Harris-Maxwell is stepped down through two 75 K.W. transformers to 550 volts. On the property there are various motors for driving the different pieces of machinery. Power was supplied for a time for the running of the mill on La Mine d'Or Huronia. The latter had a small electric plant of its own on Victoria creek, but it was closed owing to lack of storage capacity.

Block "B" Associated Goldfields (Harris-Maxwell).

This property consists of two claims, H.S. 114 and 115, on the northwest shore of Larder lake. An inclined shaft has been sunk to the 65-ft. level, where drifts and cross-cuts have been run, and a raise connected with the open pit. From the open pit level a vertical shaft or winze has been sunk to the 500-ft. level, stations having been put in at each 100-ft. depth. On the 500-ft. level about 150 feet of drifting and cross-cutting have been done. The openings are all in silicified dolomite with the exception of a narrow trap dike occurring in the inclined shaft or tramway to the mill. A 10-stamp mill was built in 1908 and a few trial runs made by the Harris-Maxwell and the Lucky Boy Mining Companies. The last mentioned had the property under option for two months in 1909. An additional 30-stamp mill was built in 1912, and completed early in 1913, under management of E. T. Brooks, and run by electricity supplied from the Raven Falls hydro-electric power plant, which was completed at about the same time. Desultory mining has been going on since operations began. In the early days, according to M. E. Wilson, "a shipment of 1,500 lbs. from an open cut was sent to the School of Mining, Kingston, and yielded $13.20 to the ton. However, a mill run of 230 tons from the same open cut made by the Lucky Boy Mining Co. in 1909 averaged only 45 cents to the ton. A mill run from another surface showing gave $2.20 per ton." In 1913 a production was reported to the Ontario Bureau of Mines from ore put through the mill from shaft sinking. To a depth of 440 feet the workings are largely in grey dolomite while below this the rock is rich in fuschite cut by quartz stringers and carrying much tourmaline and pyrite, the quartz at times being a foot or more in width. On the 500-ft. level a drive was run into 30 feet of this material containing visible gold, some of which is quite coarse. The size of this ore shoot has not been determined. The gold, some of which is quite pale in color, suggesting the presence of silver, is usually accompanied with much fine galena. The plant, which is equipped with various motors, consists of a 40-stamp mill with crushers, amalgamation plates, Wilfey tables, hoists, compressor saw mill, planing mill, and carpenter shop. The mill is not running at present. Forty men were employed on the property on October 1st. The company intends developing on a much larger scale in the near future.

Block "D" Associated Goldfields (Reddick).

The Dr. Reddick, the pioneer property in the area, consists of two claims, H. J. B. 29 and 30, on the northeast arm of Larder lake. The gold deposits are on the former claim and a 20-stamp mill, not in use, 1,000 feet distant near the lake shore on the latter claim. This is the property on which gold was first reported to have been found at Larder lake. The rocks consist of alternating bands of dolomite and green schists, probably all sediments, striking approximately east and west and dipping 70° to the north. The dolomite contains a network of quartz veins, some of which have coarse gold showings. Development work consists of a 90-ft. shaft with approximately 725 feet of lateral work on the 83-ft. level, and numerous open pits. The mining plant consists of a 20-stamp mill and a 225 H.P. motor which drives a compressor of 2000 cu. ft. capacity. A mill run of about 100 tons from an open pit was put through the mill in 1908 and a small production recorded. According to M. Ogilvy, then in charge, this ore ran $10 to $12 of gold to the ton. On further exploration by H. P. Depencier a drive 350 feet long at the 83-ft. level was made in under the large open-cut, all of which was in material carrying but little gold. In the summer of 1911 development work was renewed by cross-cutting at the 83-ft. level in the opposite direction in the hope of ascertaining the extent of a second surface gold showing. At a distance of 62 feet from the shaft an orebody was encountered which is 20 feet wide and said to run $10 per ton. A small stope was made and some ore milled between July and October, 1911. after which time the property remained closed until the Associated Goldfields bought it in August, 1917. Since then an electric transmission line has been extended to the property and the stope on the 83-ft. level has been extended until it is approximately 250 feet long, 20 feet wide in the centre and tapering at the end, and 25 feet high (Oct., 1918). At that time gold could be seen in different parts of the top of the stope. The gold usually occurs in a fine-flour state with iron pyrites, some copper pyrites and native copper along dark seams of chlorite, calcite, fuchsite and other minerals. There is no trouble in finding samples containing visible gold on many parts of the dump. More aggressive mining will be done on this property.

La Mine d'Or Huronia.

Gold was found in 1912 on claims L.2586 and L.2587, on the west shore of Beaverhouse lake, in Gauthier township. These claims were taken up by La Mine d'Or Huronia and have been worked intermittently ever since, except in 1915 when an extensive examination was made of the property by A. Pare for N. A. Timmins who had the property under option, but the option was not exercised. A. G. Burrows describes the quartz veins as being narrow, and striking northeast in a greenstone cut by quartz porphyry dikes.

Gold is visible, accompanied by iron pyrites, copper pyrites, magnetite and calcite. Gold also occurs in veinlets in the porphyry. Development work consists of numerous test pits, approximately 1000 ft. of underground work and considerable diamond drilling. The plant comprises a 15-stamp mill, a tube mill, Dorr classifier, 3 concentrating tables, 2 slime tables and a cone classifier. Power was supplied for a time by the company's hydro-electric plant on Victoria creek, ¾ of a mile distant, but owing to scarcity of water the plant could not be operated for long. By Dec. 10th, 1915, a transmission line was completed from the Associated Goldfields and ample power obtained. The mill ran part of 1916, but the property was closed on Dec. 2nd, 1916, the total gold production being approximately $9,165. Operations were again resumed at the end of 1918.

Other gold prospects upon which some work has been done and worthy of mention are the Gold King, Chesterville, Kerr-Addison and Larder lake Proprietary.

The tournaline at the Harris-Maxwell and the magnetite on La Mine d'Or Huronia suggest that the deposits were formed at a high temperature and pressure and at a great depth.

Iron Pyrites Prospect in Hearst Township.

A promising pyrite prospect occurs on claim H.S.904 or No. 2717 on Sharp Creek, one-half mile from the southwest bay of Larder Lake, in Hearst township. This is one patented claim of a group owned by the Combined Larder Mines, Ltd., in which James Hales, Barrister, Imperial Bank Building, Toronto, is interested. The claims were extensively prospected near the surface for gold several years ago, but apparently with little success. In October, 1918, the writer while examining some of the old workings noticed that a mineral dump on the above claim, H.S.904, consisted almost entirely of massive iron pyrites with some gossan. The shaft was full of water, but the owners reported the shaft to be 25 feet deep with a 25-ft. cross-cut at that depth, all of which were in pyrite. The dump consists mainly of fine-grained massive pyrite with occasional quartz and dolomite stringers carrying a little pyrrhotite and magnetite. An eight-pound sample which was fairly representative of the dump yielded on analysis 43.00 per cent of sulphur and 4 cents of gold to the ton. About 100 yards northwesterly from the dump with intervening drift-covered surface is a deposit of 'sugary' quartz and 100 yards farther along the same strike is a 30-ft. shaft in a banded formation of 'sugary' quartz with much pyrite and pyrrhotite. The rocks in the vicinity are predominantly green chlorite schists and pillow lavas. The deposit is apparently worthy of further development. It lies 12 miles distant from the T. & N. O. Ry., 1½ miles from the Associated Goldfields hydro-electric transmission line. Massive iron pyrite several feet wide was also seen at a 6-ft. pit on claim H.S.913 in the southeast part of Hearst township.

GREENLAND'S MINERAL RESOURCES.

Recently a report was published in the newspapers that Greenland might be offered to Canada by Denmark, if the Allies would agree to certain annexations to Denmark. In the Toronto "Globe" an editorial writer offered the opinion that ownership of Greenland was undesirable. Similar remarks were made in the United States years ago concerning the proposal to purchase Alaska. There is no evidence of wealth in Greenland comparable with that of Alaska; but the possibilities are worth looking into.

Replying to the Globe's editorial, Dr. W. G. Miller, Provincial Geologist of Ontario and Canada's representative on the Imperial Mineral Resources Bureau writes: "You say 'the exports include seal oil, and seal, fox and bear skins, fish products and eiderdown.' But you have not mentioned the most unique of the exports, viz., the mineral cryolite. Greenland is the only country in the world that produces or has produced this valuable mineral. Cryolite has been found in a couple of other countries, but not in economic quantities. The mineral is a fluoride of sodium and aluminum and is used for several purposes, notably in the manufacture of an opalescent glass, and of enamel for ironware; a large quantity has been employed in the production of aluminum. Associated with the cryolite are small quantities of the ores of zinc, lead and copper.

"The unique deposit was discovered at the end of the eighteenth century and mining began in 1854. It extends on the surface 600 by 200 feet. The depth to which mining has been carried is over 150 feet and the deposit shows no signs of giving out. Up to 1901 a total of over 307,700 tons had been mined. In recent years the production has been from 10,000 to 14,000 tons annually. About one-third of this is exported to the United States; approximately one-half of which is reshipped to Canada for use in the aluminum industry. Canadian imports from the United States in 1913 had a avlue of $50,905; in 1914 the value was $44,683, and in 1915 it was $72,024.

"Another unique mineral occurrence in Greenland is that of the native iron that occurs on Disco Island on the west coast. Large blocks of almost pure iron were found lying loose on the hillsides and were originally supposed to have a meteoric origin, but later the native metal was found in place in basaltic rocks.

"The largest known meteorite, called "Ahnighito" or "The Tent," was discovered in Greenland. It was brought from Cape York some years ago by Rear-Admiral Peary and is now in the American Museum of Natural History, New ork. It weighs 36½ tons.

"Let us get Greenland if we can and turn some of our well-trained prospectors loose there! They may find other mineral deposits, which will easily wipe out the yearly deficit you mention, that is only $30,000. The country as yet has had little encouragement, trade being a monopoly of the Danish Crown. The fisheries are also capable of much larger development."

The name of Mr. George Torrance Milne, His Majesty's Trade Commissioner-General in Canada and Newfoundland, is included in a recent list of Officers of the Order of the Empire (Civil Division) in recognition of services rendered during the war period. Previous to his recent appointment to Montreal, Mr. Milne was British Trade Commissioner in Australia for five years. He has also resided in various parts of South America. He is a Medallist of the Royal Society of Arts, London, and a Fellow of the Royal Geographical Society.

Pulverized Coal in Blast Furnaces

Use and Application of Pulverized Coal to Blast Furnaces as developed by Experimental Work at the International Nickel Company's Smelter at Copper Cliff, Ont.

By W. L. WOTHERSPOON.

I appreciate the interest readers of the Canadian Mining Journal will have on this subject as the influence on the economic aspects of smelting is far reaching. Our experimental work is not yet finished, and I am not prepared at this date to deal with the subject as I should desire. However, the following informaton may be of interest.

The use of pulverised coal in blast furnaces for the melting of metals, smelting of ores, etc., owes its conception to the ideas of Mr. U. A. Garred, and Mr. Thomas W. Cavers, the former an American Engineer, who was formerly Chief Engineer at Washoe Smelter of the Anaconda Copper Mining Company, and who later was engaged on important engineering work with the Mount Morgan Gold Mining Company, Mount Morgan, Queensland, Australia; and more recently at the copper refinery of the Nichols Copper Company, Laurel Hill, Long Island. Mr. Garred has been closely associated with the writer during the past two years, but it is only recently that it was possible to conduct experiments on a large scale at Copper Cliff, owing to the fact that the whole energies of the staff and employees of the International Nickel Company were needed for the nickel requirements of the Allied Governments, which included very heavy responsibilities, not only in operating for production, but in extensive construction work, included in which is the Port Colborne Refinery, constructed at an expenditure of over $5,000,000. However, a few months ago, Mr. Garred was able to take one of the standard blast furnaces, smelting 500 to 600 tons a day and, by making small modifications to it, proved by practical demonstration that a considerable portion of the coke could be replaced by powdered coal. Extended runs have taken place with normal percentages of coke—namely, 12 per cent reduced to about 6 per cent, with deficiency in fuel supplied in the form of powdered coal, thus showing, even under those conditions, very important economies. However, Mr. Garred feels that his experiments should be carried further, and that very soon he will be able to reduce the coke consumption still further ,if not replace it entirely.

While Mr. Garred was proceeding with his development work, Mr. Cavers, a Canadian, was engaged at the Tennessee Copepr Company, Copper Hill, Tenn., on work of a similar character. The results at Tennessee have been like those at Copper Cliff, very encouraging, as may be inferred from the following data. The work carried on by Mr. Cavers applied to standard blast furnaces with run of mine ore. Under normal conditions, consumption of coke with such ore amounted to 6 per cent. Several months ago two runs, one of twelve days, and another of fifteen days, were arranged, when the coke was replaced in its entirety by powdered coal, and the percentage of the latter used amounted to 3.8 per cent. This showed not only that an expensive fuel could be replaced by one of considerable less cost, but that there was a decreased tonnage of fuel required, amounting to approximately 30 per cent.

At Tennessee the manufacture of sulphuric acid from the blast furnace gases was of the greatest importance, and as a portion of that acid was used in connection with the manufacture of high explosives, it was decided by the management not to continue the use of powdered coal until the end of the war, owing to the anxiety of the inspector, who felt there was some chance of small quontities of unconsumed carbon causing discolorization of the acid. These special conditions are happily over, and the Tennessee Copper Company has now arranged to proceed actively with the use of powdered coal, and plans are in preparation for the utilization of the Garred-Cavers processes in three additional furnaces.

Patents have been granted to Messrs. Garred and Cavers in the United States, Canada, and many other countries, and other important patents are pending.

The processes are revolutinary, in that combustion of pulverized fuel takes place under pressure in the restricted spaces in the charge of the furnace. These spaces are the voids in the charge of ores, fluxes and by-products, and the channels in same that occur in the smelting zone. Under certain circumstances, for special cases, additional combustion space is provided by specially designed furnace jackets.

The pulverized fuel is prepared in the usual way and fed in predetermined quantities to the tuyeres of the furnace, where it meets the air blast supplied in the usual manner.

A company, known as the Garred-Cavers Corporation, has been organized, with offices at 43 Exchange Place, New York City, for the prupose of developing the work embodied in the Garred-Cavers patents, and there has already been shown great interest in the work done to date at Copper Cliff and Tennessee, which is particularly encouraging to those smelting companies whose operations are carried out in certain localities where the coke problem has been acute. For instance in Peru there are smelters and there are coal mines, but in the past it has been necessary to ship coke to the smelters from the United States. There are also smelters in Africa and the Belgium Congo, where coke was supplied from England.

The possible economies are far reaching. Under the auspices of the Garred-Cavers Corporation an aggressive policy in connection with the devlopment of the processes will be pursued.

Rocky Hard Coal Co.

The Rocky Hard Coal Company, which has large interests in what is known as the Alberta Coal Branch of the Grand Trunk Pacific, are actively operating on a large hill of coal which extends 60 feet above the level of the railway tracks, coal being taken from a facing of about 400 feet. The field is located near Coalspur station, 47 miles south of the town of Edson.

The coal is of good quality, and is being shipped as far East as Winnipeg. Its accessibility is indicated by the fact that steam shovels are being used in loading the coal directly from the coal beds into the cars.

Coal Production in Canada--Its National Significance

By F. W. GRAY.

The Federal Department of Mines announces that the production of 15,180,000 short tons of coal from Canadian collieries during 1918 is the largest annual production yet recorded for Canada. The significant figures are the reduction of 337,000 tons in Nova Scotia, and the increase of 1,263,000 tons in Alberta, when compared with 1917 tonnages. For the first time also the coal output of Nova Scotia takes second place among the Provinces and Alberta leads with a production approximately estimated at six million short tons.

The continued reduction in the coal production of Nova Scotia is a direct result of war conditions, chiefly associated with and arising out of heavy enlistments of skilled miners in 1915 and 1916.

The increase in Alberta's coal output is doubtless the result of the campaign carried on by the Fuel Controller early in the year 1918 to encourage the use of Albertan coal in substitution for anthracite imported from the United States, and possibly also some export of coal from Alberta to those districts of the United States lying directly to the south of the coal districts.

While, therefore, the outstripping of Nova Scotia by Alberta may at this time be regarded as a direct result of the war, and while it may be that during the next ten years we may see some attempt in Nova Scotia to regain the hitherto unchallenged position of that Province as the leading coal producer in Canada, yet the figures of 1918 have only anticipated an inevitable development of the future. As the population and industries of the Prairie Provinces increases, the relatively large coal resources of the West will become apparent, and Nova Scotia will do well if it holds the second place for any great number of years.

Great significance of the future of Canada, and great influence on the political orientations of the future, lie in these latest figures on coal production by provinces. The problem of the "manufacturing East" and the "agricultural West" that is so often dilated upon, and which has recently been emphasized by the belligerent, not to say selfish, platform adopted by the Western farmers, bids fair to assume a new aspect. Coal production always connotes industrial and manufacturing growth, and when the West commences to fulfill the destiny that is implicit in its combination of agricultural lands of vast extent, combined with mineral resources that far exceed those of the Maritime Provinces, the people who live "down East" will be compelled to hard thinking. Maritime union would seem to be a logical outgrowth from the changing relative conditions of the East and the West. There is a touch of the archaic in the retention by the three Maritime Provinces of New Brunswick, Nova Scotia and P. E. Island, of all the trappings and expenditures of three separate and distinct systems of parliamentary government, each with two legislative chambers, and this slightly archaic and decidedly expensive triplication of government extends into the administration of the natural resources of the mine, forest and sea.

Those who think of Canada as a nation, destined we trust to live in friendly independence alongside the United States, should not overlook the further significance of the coal production of the United States, which in 1918 reached the unprecedented and stupendous total of approaching seven hundred million tons of coal. In describing the coal output of the United States in these terms there is no desire to strain after superlatives. Coal production on this scale is in simple truth unprecedented in the world's history, and not only is it correct to describe it as stupendous, but one might go further and point out that it is a portent, a fact of to-day's history that should be digested and pondered over. The Canadian production of fifteen million tons, although it may constitute a record, is very small in comparison. National independence in this age of steam and electricity is well nigh impossible without the possession of coal.

There is a vague impression abroad that Canada's deposits of coal are vast and illimitable. This is not so. In consideration of its extent, its traditions of the past, and its hopes of the future, Canada is comparatively poorly supplied with coal deposits, particularly in the East. The coalfields of Nova Scotia represent but one per cent. of the coal resources of Canada, which is equivalent to stating that ninety-nine per cent. of the coal deposits of Canada are situated West of Winnipeg. A proper realization of the comparatively meagre coal resources of our country is a desirable thing to inculcate, because it will lead to a realignment of our ideas along many necessary avenues of thought, and it will emphasize the necessity for careful exploitation and conservation of Canada's coal wealth.

Among the British Dominions, Canada to-day ranks high as a producer of metals and minerals, but the extraction and purification of metals for commercial sale is in the first instance dependent on a supply of fuel. Wood fuel and water-powers have a certain limited application in this connection, but generally speaking, metal industries on a large scale are not possible in the absence of a plentiful supply of coal. In a country of vast distances, where transportation plays such an important part in our political development, and under somewhat rigorous climatic conditions, coal supply assumes an aspect of peculiar importance, an aspect that is not limited to provincial considerations, but is of national and federal importance.

We Should Have a Ministry of Mines.

It can hardly be contended that the coal industry of Canada, or any part of the mining industries of our country, are adequately represented by any ministerial department at Ottawa.

We need a Ministry of Mines, the creation of a portfolio in the Cabinet with real powers, assisted by ample funds, and employing under the leadership of a Minister of technical and financial ability, the specialists that are now scattered through a dozen unco-ordinated departments at Ottawa.

The Canadian Council of Agriculture which recently convened at Winnipeg, stated with becoming modesty that "Agriculture is the basic industry upon

which the success of all other industries depends." Well, maybe so, but will the agriculturists explain how modern agriculture could exist without coal and metals?

We will not say that mining men are modest, but it can be truthfully stated that the real importance of mining to Canada is but poorly appreciated by the country at large, and the basic nature of mining in Canada is overshadowed by the greater unity and possibly the greater vociferation of lesser breeds, who, if they are not already outside the law, are getting pretty close to being so, if the Winnipeg meeting of the farmers is indicative of the real feeling among these lords of the western lands.

A Ministry of Mines is being urged for Great Britain. A more far-reaching and pregnant proposal involves the co-ordination of the mining resources of the Empire, and their exploitation for the benefit of the associated nations thereof. Canada should not stay behind the procession. The mining industry should be represented in the Federal Parliament, and it should have a Minister of Mines to give it a voice and a policy.

BRITISH COLUMBIA'S COAL OUTPUT IN 1918.

With figures available which make possible an estimate of the coal output of British Columbia for the month of December it is found that the production of the Province for the year 1918 shows an increase over that of 1917 of approximately 174,096 tons. For the past year the total was 2,572,811 tons these figures, although based on reliable information, are as yet unofficial) as compared with 2,398,715 tons.

To those who have been closely following the past year's development in the coal fields of British Columbia this is a decided disappointment. At the end of the month of September it was thought that the end of the twelvemonth would find the production far in advance of that of 1917. Consequently the small margin indicated while not unwelcome, is not considered to be anything like as satisfactory as might have been confidently looked for if hard luck, in the form of the so-called Spanish influenza, had not intervened.

The influenza struck the coal mining camps with special violence. The effect of the epidemic was felt throughout the months of October and November in the output of the mines of Vancouver Island, as well as those of the mainland. But the result was particularly disastrous to the Island's showing, there being a slump which brought the aggregate of its collieries down to 29,139 tons below that of 1917; the total figures being: 1918, 1,666,582 tons; 1917, 1,695,721 tons. Increases, however, can be recorded in the Crow's Nest Pass and the Nicola-Princeton fields. In the former the output of 1918 is 179,200 tons ahead of that of the previous year and that in spite of the fact that for a time the influenza raged throughout that district. The explanation is to be found in the fact that in 1917 the output in the Crow's Nest Pass was seriously affected by the explosion of April of that year and the extended strike which followed. The Nicola-Princeton increase of 23,035 tons, the production of 1918 being 174,278 as compared to 151,243 in 1917, must be put down to development spurred on by the abnormal demand of recent months.

It is interesting and gratifying to be able to note that with the removal to an extent of the blighting influence of the plague among the miners in the month of December, the production immediately began to assume normal proportions. The result is that that month shows an increase of approximately 46,329 tons over the month of November.

Detailed statistics follow:

British Columbia coal production (approximate):

1918	2,572,811 tons
1917	2,398,715 "

British Columbia coal production by districts:

Vancouver Island—

1918	1,666,582 tons
1917	1,695,721 "

Nicola-Princeton:

1918	174,278 tons
1917	151,243 "

Crow's Nest Pass:

1918	731,951 tons
1917	551,751 "

Tonnages for the months of November and December:

	November. Tons.	December. Tons.

NOVA SCOTIA STEEL AND COAL CO'S PROGRAM.

D. H. McDougall, president of Nova Scotia Steel and Coal Company, Limited, announces that the company will take advantage of the slack spell in steel production to overhaul the plant and make certain additions and changes with a view to securing greater efficiency. Chief among these latter will be the provision of new and thoroughly up-to-date by-product coking ovens. Further the Wabana mines will be developed so that the Scotia Company will produce iron ore far in excess of its former outputs and at materially reduced cost.

Hayden Stone and Company, who represent the large United States interests in the Nova Scotia Steel and Coal Company have aided in the developments of these plans which will require considerable time and capital. The position of the company is strong at the present time, having regard to the provision of an additional $5,000,000 of working capital due to the sale of that amount of stock in 1917 and also to the fact that the company is in a strong financial position with net current assets of $10,000,000.

Special Correspondence

NORTHERN ONTARIO.

Surveying Des Quinze Water Power.

Signs of activity are apparent in connection with the Great Des Quinze water power project, which is situated some 25 miles northwest from Cobalt. Although very few details are available, it is understood a staff of surveyors were engaged last month by M. J. O'Brien, Limited, a twenty million dollar corporation of Montreal, headed by M. J. O'Brien, of Renfrew. This corporation was formed some time ago for the taking over of the extensive interests previously held by Senator M. J. O'Brien, among which is a part of the great water power of Des Quinze. This is perhaps the greatest undeveloped water power in the Province of Quebec. Various estimates place the power of this wonderful volume of water all the way from 150,000 to 250,000 horse power. Situated as it is, in the central part of the great mineralized area of Northern Ontario, as well as close to the great pulpwood resources of the district, it is considered highly probable a development of great magnitude is under contemplation. Up until the present time no official advice has been given out regarding the intentions of the big corporation. Although the ending of the war was expected to be the signal for extensive developments in the pulp and paper industry of the North, the actual commencement of work on this great power scheme would come as a considerable surprise to the inhabitants. Whether the present survey is for immediate use or for a more distant date is a matter of much speculation. As is well known, M. J. O'Brien acquired the nucleus of his large fortune in the development of the natural resources of the North Country, among which operations the most noteworthy are the O'Brien Mine of Cobalt and the Miller Lake-O'Brien mine of the Gowganda camp. Each of these mines are producing upwards of a million dollars' worth of silver per annum, and have extensive ore deposits in reserve. Therefore, when these extremely important facts are taken into consideration, there appears ample reason to believe the not distant future development of the great Des Quinze power is actually being considered. The development of this power is a matter of great interest to the district in general, providing, as it undoubtedly would, ample energy for the many new industries which no doubt will eventually be developed in the mining, pulpwood and lumbering sections of the North Country, where abundance of raw material awaits but the necessary power and supply of labor to turn it into marketable products.

One Company Asked for 1,000 Men.

One of the Porcupine mining companies recently asked the Organization of Resources Committee, Toronto, to supply them with one thousand men. This mine is presumably the Hollinger Consolidated, where, it is understood, about 2,500 men are required to work the mining and milling plant at capacity. The request was made that the men be supplied, four hundred in the first group and forty per week thereafter until the desired number was attained. During the past couple of years about twelve hundred men have found daily employment at the Hollinger-Consolidated, and a one thousand ton daily capacity addition put on the mill has so far not been utilized, except for but a short time. The employment of a working force sufficiently large to permit of operation at capacity, will be followed by a big increase in ore treated and gold production. During the year just past the Hollinger-Consolidated paid 5 per cent. in dividends, which amounted to $1,230,000. A plan for the erection of a large number of houses to meet the needs of the increased staff of workmen at the property is understood to be under consideration. The Hollinger-Consolidated mine is the nucleus of the town of Timmins, and housing accommodation in this thriving gold mining town at the present time is said to be inadequate.

Kirkland Lake Mines Forging Ahead.

The prevailing epidemic of Spanish Influenza was a retarding factor in the developments at several of the Kirkland Lake gold mines during the past month. The epidemic now appears to have run its course, making it possible to carry on normal work and the usual production is anticipated for the current month. Taking into consideration the position of the operating mines, together with the various new developments under contemplation on a number of the leading and well-situated prospective properties, it is evident the Kirkland Lake district is entering upon the most active period in its history. With the Kirkland Lake Gold mines almost ready to begin production in a big way, thus joining the Lake Shore and the Teck-Hughes in the producing list, and with the probability of the Tough-Oakes being among the producers within a few months, the Wright-Hargreaves proceeding with the installation of one of the largest mills in the camp, the Burnside having this month about completed the installation of a 30-ton mill, the probabilities are that six mines will be producing gold in the Kirkland Lake district before the end of 1919. The increase in the number of non-producing, but promising properties that will be operated in an aggressive manner during the year may reasonably be counted upon to at least keep pace with the number of producers. The opening month of the year 1919 finds the camp in the best proven as well as prospective position in its history. The developments of the six aforementioned mines have proven the stability of the camp, while the extent of the promising properties on which extensive development work is planned, gives good reason to believe that the producing area of the Kirkland Lake camp will be greatly enlarged.

Potter and Stevenson Properties.

Early developments of an interesting nature are shortly to be expected in connection with a consolidation of the Potter and Stevenson properties in the Kirkland Lake camp. These properties are centrally located, being situated on the south side of the Lake Shore Mines. American capitalists are understood to be concerned in the early development of the properties, which it is expected will soon be in operation.

Will Begin Work at Hunton-Kirkland Soon.

Plans are now under way aiming at the actual commencement of development and exploration on the Hunton-Kirkland property some time in February. A deal was recently closed for the purchase of the property, the first cash payment having been made. The ultimate purchase price is said to be well up in six figures. Some of the richest samples of gold ore ever found in the Kirkland Lake district came from the surface of the Hunton. At the outbreak of the European war, English interests were negotiating for

the purchase of the property, but nothing of a concrete nature transpired. With the ending of the war it was not surprising that these promising claims should attract attention, and the announcement that Toronto and American capitalists will develop the property gives general satisfaction.

Kirkland Townsite.

English interests are understood to be involved in a deal for the Kirkland Townsite property, and while the engineers of the company look upon the proposition favorably, the final ratification remains in the hands of interests in England. In well-informed circles, however, it is believed nothing of an adverse nature will develop, and the final sanction of the terms of purchase will be transacted in a short time.

Tough-Oakes.

It is now considered only a matter of a short time until some definite plan will be decided upon for a resumption of operations at the Tough-Oakes Gold Mines of Kirkland Lake. A general meeting is to be held at which a new directorate will be placed in charge. It is considered probable that at least a portion of the present directorate will remain on the board. According to semi-official advice, Commander Burnie, of London, Eng., is now in control of the company, and from the same source it is also learned that Mr. Kilpatrick, also of England, and who is associated with Mr. Burnie, is soon to arrive in Canada for the purpose of arranging the future policy of the company, on behalf of his principal. In the meantime the mine workings are being kept pumped out, and the large, efficient mill is being kept in a good state of repair. The course to be taken on resumption of operations will probably be an aggressive underground development program for a few months, followed by the re-opening of the mill. Sufficient money to carry out such a policy is said to be now on deposit for the company in Canadian banks. Before becoming involved in its costly and serious litigation the Tough-Oakes was the leading producing mine of the Kirkland Lake camp. For a time a production of approximately $60,000 monthly was maintained. By those in a position to intelligently judge of the merits of the property it is considered possible that this record will be exceeded, providing the mine is given a fair opportunity. The news of a settlement of the differences of the company's interests is of vital importance to the future of the company, and has been the cause of rejoicing by shareholders in the district.

Boston Creek Merger.

Well-founded reports are current of the merger of the R. A. P. Syndicate property and the Boston Creek mines, of Boston Creek. A merger such as reported to be probable should work out to the mutual benefit of the two companies. On one of the properties is a good mining plant sufficiently large to develop both companies' holdings to a large extent, while on the other camp buildings adequate for the accommodation of a large working force have been erected. On both of the properties considerable underground work has been done, and a good deal of gold ore has been blocked out.

Electric power is available in the Boston Creek field, obtainable from the Northern Ontario Light and Power Company, whose transmission line passes through the camp. The next few months are expected to be important ones in the history of the development of the Boston Creek field.

Burnside Mill Nearly Ready.

The new mill at the Burnside property at Kirkland Lake is receiving the finishing touches and will soon be ready for operation. It is probable the mill would have been ready for operation earlier, had it not been for the fact that a number of wrong parts of equipment were shipped by the manufacturers. However, all should be in readiness for a trial run by the end of the current month. The new mill has been designed with a capacity of thirty tons per day. Provision has been made for increasing the capacity of the plant according to the requirements of the mine development. The Burnside adjoins the Tough-Oakes.

Machinery Arriving for Indian Peninsula Mill.

The first car-load of machinery for the new 100-ton mill for the Indian Peninsula Mining Company has been shipped to the property. A first-class road has been cut from the town of Amos on the Transcontinental Railway to the mine. The property is located about twenty-one miles south from the railway and the Quebec Government built fourteen miles of the new roadway to the property, while the company completed the remaining seven miles, making available a good winter road over which the machinery and other equipment for a flotation mill of 100-tons daily capacity will be taken in. The company expects to have the plant treating this amount of molybdenum ore early in the spring. The ore will pass through a 13 x 4 crusher, and be elevated to a bin from where it will be fed by belt feed to a 5 x 5 ball mill in close circuit with a Duplex Dorr classifier, the water being controlled in the ball mill to the desired moisture. A 100-ton Groch Centrifugal duplex unit will be used to float the molybdenite. The plant will be steam driven. The company has cut nearly all the timber for the construction of the mill with its own saw mill plant. The control of the stock of the Indian Peninsula is under option to the Penn-Canadian Mines interests, which assures efficient and energetic development of the property.

Ontario-Kirkland New Plant Ready.

The Ontario-Kirkland property, formerly the Hud claims, is ready to operate its new electrically operated plant, and is fully equipped with the requisite machinery to carry out the proposed program of more than 1,500 feet of underground work. Some considerable delay in receiving the supply of electric energy took place, or the plant would have been in operation before Christmas. Sufficient capital has been made available for the development program, which includes continuing the 100-ft. shaft to the 300-ft. level and the driving of about 1,500-ft. of drifts and cross-cuts. Several well-mineralized veins in which gold occurs are in evidence on the property.

Miller-Independence.

Mr. W. E. Simpson, who, together with Mr. Fr[illegible] Groch, of Cobalt, is consulting engineer for the Miller-Independence Mines at Boston Creek, left the first week in the new year for the mine, for the purpose of thoroughly sampling and surveying the property. The entire surface and underground workings are to be surveyed and sampled. This work is preliminary to the beginning of the big development program now proposed, and for the carrying out of which the capitalization of the company was raised from 500,000 to 700,000 shares. The new issue of the stock, which consisted of 200,000 shares, is understood to have been subscribed for at $4 per share, thus proving ample capital for extensive operations.

1,950,000 Tons Proven Ore at the Dome Mine.

According to official advice concerning the affairs of the Dome Mines, the outlook for the company is bright. In many ways the policy adopted during 1917 has been justified. In the light of events which followed the actual curtailment of work, with the exception of a comparatively small force engaged on development and underground exploration work, there was no alternative but to have adopted such a policy. Already costs of conducting mining operations are receding, labor is becoming more plentiful, with a decided improvement in efficiency, and in various ways conditions are adjusting themselves.

Official figures show 1,950,000 tons of proven ore. The average gold content is $5.10 per ton. The total value is $9,945,000. Prior to the economic strain caused by the war the Dome reduced its ore at a cost ranging only slightly over $2.50 per ton. To equal such a record seems the probable thing to expect during future operations. It may be, however, that as mining is carried to deeper levels, the cost of producing may record some increase. It should perhaps be pointed out that the above figures of ore reserves occur in ground between the surface and the 700-foot level. Not one pound of ore below that depth is included in the estimates of close to ten million dollars. Therefore, even though work has been carried to a depth of 1,245 feet, and a considerable lateral work done between the 700-foot level and that depth, and a number of orebodies are being cut, yet its enormous value is not sufficiently proven to be definitely included in the proven ore reserves. This section of the mine, perhaps of greater value than the upper workings, remains as yet a great potential asset, the amount of which will be estimated following the requisite amount of development work. The ore in the lower levels, as so far indicated, is of a higher grade than that occurring in the upper workings. Therefore, any slight increase in the cost of reducing the ore will be compensated for in the higher average gold content. Conservative mining interests estimate the probable profit from every ton of ore treated for the next several years at the Dome, at $2.50 per ton after paying all costs.

The surplus as of October 31st last, is expected to be sufficient to cover requirements pending the return to a producing basis.

The capacity of the Dome mill and the mining facilities for providing the full tonnage to keep the mill at full capacity is approximately 40,000 tons per month. In computing these figures, all the added energy necessary to hoist ore from great depth is taken into full consideration.

Therefore, treating 40,000 tons monthly, recovering over $5 per ton or upwards of $200,000, it follows that with a net profit of $2.50 per ton the total net profits would approximate $100,000 monthly. Total output is thus expected to exceed $2,500,000 annually with net profits of $1,200,000.

The company is capitalized at $5,000,000, divided into 500,000 shares, with a par value of $10 per share. Just 400,000 shares are issued, the balance remaining in the treasury. Therefore, the company is obliged to pay dividends on only the $4,000,000 issued capital. It will at once be seen that a net profit of $100,000 would be equal to 2½ per cent. monthly, or 30 per cent. annually.

Mining at the above rate, the present proven ore reserves of the Dome are four years ahead of mill requirements. Of this upwards of 320,000 tons, or eight month's requirements, is already broken and lying in the stopes, the cost of mining having already been paid for. Also in the extensive workings from the 700-foot level down to nearly one-quarter of a mile the tonnage of ore added to reserves annually from this date forward may reasonaly be expected to exceed the tonnage taken out—this to continue for a good many years. In the past the company easily paid dividends at the rate of 20 per cent. annually. With the present improved facilities making possible a maximum profit of 30 per cent. annually, the contention of conservative mining men in declaring dividend disbursements at the old rate will follow close upon the heels of a resumption of production seems quite reasonable—even after making all due allowance for unforseen contingencies.

Will Develop Fidelity Property.

Fairly extensive plans for the development of the Fidelity property in Teck township adjoining the Kirkland Lake LaBelle Mine have been decided upon. Already a portion of the machinery for the plant has arrived at Swastika, and is being taken to the property. The new plant will be steam driven.

New Development Work in Whitney Township.

Preparations are under way for the starting of mining operations on the two claims north of the Bellinger Mining Company in the northwest of Whitney township at an early date. The claims lie three miles north of South Porcupine, and have been acquired by Toronto interests. There is a 200-foot shaft on the property with 20-feet of lateral work at the 100-ft. level, and 50-ft. of crosscutting at the 200-foot level. A vein of ankerite and quartz stringers running parallel and 35 feet in width has been uncovered. A number of stringers in the main vein carry gold values. Mr. T. J. Wright is in charge of the work of fixing up the road and taking in machinery for the operation of the property.

Steam Plant for Canadian-Kirkland.

Arrangements are being made for the installation of a steam driven mining plant on the Canadian-Kirkland property in the Kirkland Lake camp. The Canadian-Kirkland property was recently taken over by Geo. E. Drummond, of Montreal, and D. H. Angus, of the Right of Way Mines, Cobalt. Providing development work with the steam plant proves satisfactory, later on it is the intention of the new control to install electrically driven machinery.

Alexo Nickel Mine.

During the month of December the Alexo Mine at Porquois Junction shipped 1,015,000 pounds of nickel ore, which is well up to the general average of the mine. The property is located about twenty-five miles east from Porcupine. A large body of peridotite is in contact with the pillow lava on its northern flank. The ore body has been opened up for upwards of 700-feet in length, and has a width of from three to forty feet, and a dip of from 65 to 80 degrees to the north-west.

Power Plant for Gowganda.

Reports are current of the likelihood of the South Bay Power Company proceeding with the construction of its power plant in the Gowganda district with the arrival of spring.

Casey-Cobalt.

During the third week in January the Casey-Cobalt Mine, situated in the township of Casey, about nine miles north-east of the town of New Liskeard, shipped two carloads of silver ore. One carload was consigned to Cobalt, while the other went to Denver, Colo., for treatment. The Casey-Cobalt is the only operation in its immediate vicinity, and is a regular producer of silver ore.

Drilling Cotter Property.

Results of the diamond drilling operations on the Cotter property at Boston Creek have been so favorable that the company operating these claims have decided upon the preparation of plans for extensive mining operations, which will be carried out as soon as possible.

Boston Creek.

The importance of the Boston Creek camp is being more clearly brought to mind every day, with the sensational deposits of gold ore on the Miller-Independence, the Hollinger interests developing the Mondeau, and the Mining Corporation of Canada seeking property in the camp, together with recent developments on the Cotter and Cullen-Renaud properties, it appears certain much substantial development will be accomplished in the district during the current year.

BRITISH COLUMBIA.

Mr. George Fraser has resigned the position of Superintendent of the coal mining operations at Cassidy's, Vancouver Island, of the Granby Consolidated Mining & Smelting Company. Mr. George Hargreaves also has resigned the position of mine manager. The duties of both the foregoing offices have been assumed by Mr. R. R. Wilson, formerly General Superintendent of the Crow's Nest Pass Coal Company, Mr. Wilson is a son of Mr. W. R. Wilson, General Manager of the Crow's Nest Pass Coal Company.

Lack of Interior Lubrication Cause of Hoisting Accident .

A verdict has been given by the Coroner's Jury before which an inquest was held into the cause of the death of sixteen coal miners at Nanaimo, B.C., on September 10th last. It reads as follows:

"We, your Coroner's jury, empannelled to inquire into the death of Robert Kelly and fifteen others in Protection Shaft, of the Canadian Western Fuel Company, September 10th, 1918, find that the said men came to their death by descending on a defective cable, which broke owing entirely to the oxidizing of the wires, chiefly caused by apparent absolute lack of any internal lubrication, leaving the wires thus exposed to the action of a more than normally corrosive water and a humid atmosphere. In view of the evident general unreliability of exterior lubrication measures, which from the evidence adduced failed to preserve to any very appreciable extent the life of said cable or preclude against deterioration, we suggest that the Department of Mines recommend the appointment of an expert inspector of hoisting ropes, cages, safety catches and all appurtenances generally, and that legislation be enacted whereby under such abnormal conditions as obtain in said shaft no new hoisting cable be retained in service longer than some reasonable time to be determined by the Department of Mines as otherwise there would appear to be no practicable process which can be adopted and absolutely relied upon looking to the absolute dependability of such hoisting cables against defect or breakage under all present governing conditions."

Nanaimo Coal.

Criticism of the quality of coal being turned out i Nanaimo, B.C., by a writer of Vancouver, B.C., i much resented in the former town. One of the paper of Nanaimo observes: "In this connection it must b remembered that the local mines have been workin under the same war conditions which have hampere every other industry as well as that of coal mining Since conscription came into force work has been ne cessarily cut down to meet the new conditions unt lately practically one shift only each day has been th rule. At the same time, with the supply of efficien labor thus reduced, the demand for coal increase from every quarter. In order to meet the enormou demand at least half way it has been found necessar to send out Nanaimo coal without having been, as fo merly, washed and screened. At the same time co of somewhat inferior quality from the Harewoo Mine, has been mixed with the coal of the best loc quality in order to keep up with the demands fro day to day." The writer explains that the publi have had to stand for "War Coal" as they stood fo "War Bread," and with reference to the quality Vancouver Island coal quotes Professor E. T. Hodg who said that of Canada's coal reserves British Co umbia has the best as well as the most of it.

The strictures to which objection is taken read i part as follows:

"Take, for instance, the price of coal in this Cit (Vancouver). We are forty miles from the p mouth by water. Coal is transported on scows towe by tugs, the very cheapest form of coal transport tion. Yet run of mine coal, composed of a large pr portion of worthless slack and other rubbish, costs much per ton in Vancouver as the finest Pennsylvani anthracite coal, washed and screened, costs in Toro to after being transported by rail several hundre miles from the mines. I should judge a ton of th kind of coal supplied in Toronto will generate fift per cent more heat than the stuff which clogs ou pipes with soot and our grates with clinkers. If ther was an honest intention in right quarters, Vancouver coal bills would be reduced by at least 25 per cen pronto. Apparently there is no intention, honest o otherwise, of anyone in authority making an inquir into the oppressive coal prices of this city. We Vancouver inflicted with an Ontario climate our co situation would be little short of desperate, as indee it has been at times, and that with millions of tons coal within forty miles of the city."

Copper Smelting.

The Vancouver Chamber of Mines announces that it winter series of lectures on mining has been inaugura ed, the first having taken place on the 7th of January when Prof. Turnbull, of the University of British C lumbia, delivered a lecture on "Copper Smelting."

PLATINUM AT FRANKLIN CAMP, B.C.

The establishment recently of the fact that there is platinum bearing mineral in the Franklin Camp, near Grand Forks, B.C., has caused a flutter of interest in British Columbia mining circles. Mr. William Thomlinson, ore sampler for the Canadian Munition Resources Commission, spent some time in that district late last summer and his report, which has just been published, is accepted by some as indicating that prospectors are close on the trail of the source of the platinum which has been found in the placer ground of the Tulameen River.

Mr. Thomlinson states that he is authorised to make public the following information regarding the tests for platinum made on the material taken by himself, during the month of September last, from mineral claims situated on the so-called "black lead" in Franklin Camp, Grand Forks Mining Division. He proceeds:

"Early in the month of August I visited Franklin Camp and took samples from the various workings on the "Maple Leaf" mineral claim, and sent the samples to the Dominion Assay Office at Vancouver to be assayed for platinum. Two of the samples from the "Maple Leaf" claim taken from an open cut from which two cars of copper ore had been shipped were found to contain, respectively, 0.15 oz. and 0.17 oz. of platinum per ton, and the results appears to me to indicate that the platinum content of the ore was roughly proportionate to the amount of the primary copper minerals, especially chalcopyrite, showing in the ore.

"Later Mr. J. J. O'Neil, of the Dominion Geological Survey, visited the "Maple Leaf" Claim with me, and being interested in the mode of occurrence of the platinum took a sample of almost pure chalcopyrite, occurring as a small lense in the pyroxenite, and has the sample assayed for platinum at the Dominion Assay Office at Vancouver. This sample showed a content of 0.38 oz. platinum a ton.

"The mineral bearings gangue on the "Maple Leaf" claim is mainly pyroxenite, with some tongues or inclusions of augite-syenite on the hanging wall side of the lode, and the copper minerals, principally chalcopyrite, occur in bunches and veinlets and as disseminated specks, throughout the pyroxenite and the syenite.

"Owing to good results from the Maple Leaf samples and noting that the pyroxenite zone or so-called "Black Lead" extends almost entirely across Franklin Camp, I visited and sampled all the principal properties situate on the pyroxenite-syenite contact zone. On most of the claims so situated the lode material appeared to be barren of economic minerals; but on several of the claims there could be seen at or near contacts a tendency for the copper or iron sulphides to form mineralized belts or masses. Most of my samples were taken from places where such segregations of copper and iron sulphides occurred and especially from where the copper-bearing minerals were in evidence; although the oxides and sulphides of iron were also included in the samples.

"Although most of the samples taken, on being assayed, showed appreciable amounts of platinum, it cannot yet be stated with certainty that more than very small portions of the "Black Lead" or pyroxenite belt can be mined on a commercial basis.

"In the samples assayed there appeared to be certain proportions between the copper-bearing minerals present and the platinum and the platinum contents; but at the "Mountain Lion" claim the platinum appears to be entirely associated with sulphides and oxides of iron.

"Whether the platinum occurs as native platinum or as sperrylite, the arsenide of platinum, has not yet been determined; but, I presume, it may be in the latter form, and associated with the sulphides and oxides of copper and iron where they are found segregated in the pyroxenite zone.

"On several properties, such as the "Gloucester" M.C., situate near to and on the dip of the pyroxenite ozne, platinum may also be found to be associated with the sulphide ores; and, perhaps, it may be advisable to have all the ores of the entire camp tested for the metals of the platinum group.

"There is, however, much yet to be learned regarding the mode of occurrence of the platinum, and as to the average values of the material forming the so-called "Black Lead."

"It is probable that only certain portions of the pyroxenite zone contains platinum, copper or other metals in economic amounts; therefore much further investigation may be required, but I certainly consider the matter worthy of detailed research on the part of the Government or of the large mining corporations.

"Samples of the undernamed properties contained platinum as follows:

"Maple Leaf," 3 samples, 0.15, 0.17, and 0.38 ozs.
"Iucky Jack," 3 samples, 0.04, 0.06, and 0.08 ozs.
"Mountain Lion," 2 samples, 0.09 and 0.09 ozs.
"Golden Age," 1 sample, 0.06 ozs.
"Averill Gp," 2 samples, 0.09 and 0.09 ozs.
"Buffalo," 2 samples, 0.08 and 0.19 ozs.
"Ottawa," 1 sample, 0.06 oz.
"Columbia," 1 sample, 0.04 oz."

Metal Output Order, $1,000,000 a Month at Trail.

During the calendar year of 1918, according to a statement given out by local officials, the value of the metals smelted or refined by the Consolidated Mining and Smelting Company, Ltd., at Trail, B.C., was approximately $12,676,247 (the figures for the month of December being estimated) or over $1,000,000 a month. Lead was the leader with a value of $3,500,000; spelter next being valued at $3,023,290; and the others followed. Some 75 tons of lead piping were made valued at $15,000.

Appended are the detailed figures:

Lead	(Lbs.)	40,662,704	$3,537,655
Spelter	(Lbs.)	25,453,797	3,023,290
Copper	(Lbs.)	9,951,781	2,557,000
Gold	(Ozs.)	72,205	1,444,000
Silver	(Ozs.)	2,088,331	2,000,476
Sulphuric acid	(Tons)	3,926	98,150
Bluestone	(Lbs.)	174,178	15,676
			$12,676,247

Many Arrays for Platinum Made.

A comparative statement of the gold bullion deposited at the Dominion of Canada Assay Office, Vancouver, B.C., shows that the year 1918 established a new record for that centre. The value of the gold bullion deposited was $4,080,184. In 1917 it was $3,257,220, and in 1916 $2,828,239. The increase in 1918 over 1917 was $822,964, and the increase in 1918 over 1916 was $1,251,945. During the latter part of the season 189 assays of platinum-bearing ores and sands were made and 77 deposits of platinum metals received. The purchase of platinum metals has been discontinued, but assays of platinum-bearing ores and sands will be continued to be made.

Accommodation is being made for the accommodation of about 150 men at Copper Mountain by the Consolidated Mining & Smelting Company. This work is

understood to be preliminary to the commencement of extensive development of the property known as Voight's Claims, which have been taken over by the Consolidated Company. This property adjoins that of the the Canada Copper Corporation, near Princeton, B.C., on which extensive work has been under way for several years, and which soon will be in shape for operation on a large scale.

Mining in Northern Manitoba.

The northwestern district of the Province of Manitoba is attracting some attention as a copper producer. The Mandy Company, which is a Canadian organization of a Tonapah, Nevada, firm, has had an output during the past year of about 9,000 tons of high grade copper ore. The property now is in shape, it is stated, to produce 20,000 tons in 1919, but whether this will be done in view of the present uncertain prospect in regard to the market is a question. In the same region, according to reliable report, diamond drill has been under way on low grade copper deposits with the result that some 2,000,000 tons have been blocked out. Transportation has been and still is somewhat of a problem. The ore which thus far has been shipped has gone to the Trail (B.C.) smelter. Realizing that the industry cannot stand so long a haul the company is planning to instal a smelter and build a railway giving connection with one of the main line Canadian railways.

Increased production of gold from Ontario Mines—

This week comes the important announcement that the directors of the Porcupine Crown Mine have decided to re-open the mine. This is one of the most hopeful signs for the gold district. From this date forward the idle mines may reasonably be expected to begin operations, and that within the next few months every gold mine of importance in the country will be operating at full blast. The next three former producing mines in line for resumption of production before very long are the Schumacher, the Dome and the Porcupine V. N. T. In the Kirkland Lake and Boston Creek districts activity is also increasing. During the month of December the Lake Shore Mine produced a greater quantity of gold than in any previous month in its history. In the Boston Creek districts, the Miller Independence has definitely arranged for deep mining, and is assuming ever larger proportions.

Will Examine Resources of Greenwood District.

Citizens of Greenwood, B.C., are doing everything within their power to keep the smelter of the Canada Copper Corporation, which was closed down recently, in that district and to make such arrangements as will result in its operation. They have faith in the mineral resources of that part of British Columbia; they believe that the mineral necessary to keep the smelter active exists in that vicinity and that it can be found; and they are not going to allow the smelter either to stand idle or be removed if anything within their power can prevent it. Hon. Wm. Sloan, Minister of Mines, has agreed after listening to their representations, that two of the Government Mining Engineers shall make an investigation of the conditions as to the ore resources of the Greenwood District, and submit reports at the earliest possible moment. The Citizens' Committee hope that these reports will justify their confidence and that it will be found practicable, in a commercial sense, to continue the smelter, which, of course, is the heart and the mainstay of the community of Greenwood.

Oxy-Acetylene Welding and Cutting

Welding Nipples In a Metal Tank

In manufacturing, as well as in repair work, the Presto-O-Lite Process of Oxy-Acetylene welding has proven itself a great economic factor. Metal tanks are rendered leak-proof, and where nipples are inserted the joints are made neater, stronger, and at a lower cost than is possible by any other method.

In thousands of shops and factories the Prest-O-Lite Process is displacing the rivet, bolt, and threaded joint.

Prest-O-Lite PROCESS

employes both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Presto-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the process quickly and easily.

Write for valuable illustrated literature and data on work others are doing by the Prest-O-Lite Welding Process. It may point out ways to solve your problems.

AMENDMENTS TO MINES ACT OF ONTARIO.

Questions of importance to prospectors as well as mining men in general, are being discussed. It is learned on good authority that a number of amendments to the Mining Act of Ontario are under contemplation. Any action taken, will have the double object in view of being beneficial to prospectors, as well as to the best interests of the mining industry. Among the questions being discussed is the advisability of inducing prospectors to have their claims surveyed soon after staking takes place, thus eliminating the danger of friction or dispute over uncertain and irregular boundaries. Toward this end, it would appear likely that the Department will allow the cost of survey for each claim to apply as the equivalent of about twenty-five days' work. This would be beneficial in two ways. First, many claims would probably be surveyed shortly after being staked, the cost of surveying to apply against the first instalment of work, and with these regularly established lines as guides, much of the inaccuracy of blue-prints gotten out on the strength of carelessly run claim lines, would not occur. Second, the burdens of the prospector would be made lighter to the exact extent of the cost of survey, which, under the present Act the prospector is now obliged to pay in addition to assessment work and patent fee.

Another matter that is receiving consideration is the advisability of placing a tin tag on all four corners of mining claims, instead of only on the No. 1 or north-east corner as at present. This, it is obvious, would cause the boundaries to be less liable to become confused in case of fire destroying one of the corner posts, on which might chance to be the one tin tag as at present specified.

Incidentally, in pointing out the two foregoing amendments, which are now understood, among other things, to be the subject of consideration, it might be well to also point out the necessity for amendments that would serve to protect co-holders in mining claims, where one or more of the co-holders have duly performed and recorded their assessment work, but where one or another of the co-holders has failed to do so, thus causing the entire mining claim to become automatically forfeited and imposing upon those whose work has been performed, the only alternative of applying for relief from forfeiture, involving a good deal of expense and uncertainty, as well as the usual legal proceeding before the Mining Commissioner. To overcome the possibility of such occurrences it would be necessary to add a "provisional" sixty-day period to the time when each or any instalment of work is required to be performed. Thus, in the event of one co-holder failing to record his work in the proscribed time, the remaining co-holders would have ample time in which to perform the delinquent's work, and thus protect their own interests, but the protection of such "provisional" extra period not to apply to the delinquent or delinquents themselves. Those performing the necessary work to protect the claim, should automatically become entitled to divide the entire forfeited interest of their co-holder among themselves equally or in proportion to the share of expense borne by each, or otherwise, as they should agree between themselves.

Another matter of deep concern, not only to prospectors, but to mining men in all parts of the province, is the retarding effect on the mining industry of the granting of mineral rights to settlers. It is pointed out that settlers take up land either for its cultivation or for "skinnin" the timber, and not for mining purposes. Invariably they fail to do any mining work. In various mining districts throughout the north, large sections have been held idle, due to the fact that settlers have paid some $20 or so to the Government for the right to settle on a piece of land. Undoubtedly this is a big contributing factor toward retarding development of the mineralized areas, and constitutes an evil that could be eliminated without retarding the settlement of the country. This would not rob the settler of the right to mineral occurring on his farm, provided he follow the regular proceedure of a prospector, and in addition to holding the farming rights, stake out claims and perform the required assessment duties devolving upon such a course. In the event of others staking the mineral rights of his farm, he would always be entitled to the payment for any damage to his land or buildings.

Greater inducement is being offered to those who are seeking out the hidden riches of the province of Ontario. Prospectors are being given every reasonable consideration within the power of the Department of Mines. Hon. G. Howard Ferguson, Minister of Mines, through Mining Commissioner T. E. Godson, K.C., is keeping an ever watchful eye on the mining situation in all parts of the province. Commissioner Godson is perhaps in touch with a greater variety of prospectors than is any other man in the Dominion. Disputes involving the good and bad points within the Mines Act are constantly before his attention. The opinion of gentlemen of the legal profession as expressed in each and every dispute is carefully weighed by the Commissioner, with the result that perhaps the most satisfactory mining law ever compiled, governs the mining industry of this province. Not only does this satisfactory state of affairs exist, but each year amendments are made which still further improve the Act.

It seems reasonable, therefore, to look forward to a number of the questions now under debate, as above outlined, figuring in the probable amendments for the year 1919.

Coal Dust Firing of Blast Furnaces

By T. W. CAVERS.

The increase in the price of coke in the last few years, and the ever-pressing demand for lower smelting costs, have led the metallurgist to try pulverized coal in the blast furnace. The experiments have been so successful that there is every reason to believe that the blast furnace will regain its former place in the smelting industry and again prove a serious rival to the reverberatory.

When coke is introduced into the blast furnace with the ore and flux, it is partially consumed by the surplus oxygen of the blast before it reaches the point where it is most needed. Even in rare instances, when the oxygen delivered at the tuyeres is practically all combined with the sulphur, iron and carbon in the lower part of the furnace, the hot, ascending sulphur dioxide gases, coming in contact with hot coke above, are decomposed and the coke consumed.

The logical place, therefore, for the introduction of fuel is at the bottom of the charge, a little above the level of the molten slag in the crucible. This condition is secured in coal dust firing.

By the introduction of coal with the blast, the abundance of oxygen in intimate contact with the finely divided coal, ensures its complete combustion at a point a little above the level of the tuyeres, and, consequently the utilization of all the heat generated. It has been found in practice that the coal necessary to keep the furnace in good running condition is only 55 per cent. of the coke used on the same charge. The furnace runs more smoothly and gives less trouble with crusts when using the coal. No coke whatever is used except for "blowing-in."

In the blast furnace, the fuel maintains the temperature at which the various reactions take place, and supplies the reducing agent in roasted ore smelting. The substitution of coal dust for coke does not seem to make any material change in the condition of the lower part of the charge, nor alter the character of the slag or matte. In the absence of coke, however, the sulphur of the incompletely-roasted ore takes the place of carbon in the reduction of Fe_2O_3 to FeO and makes for greater concentration.

It has not yet been demonstrated that coke may be entirely dispensed with in lead smelting, or that carbon monoxide, from coal dust in excess of what the blast is capable of burning to carbon dioxide, will prove as satisfactory a reducing agent for lead oxide as coke.

All coals are not suitable for the manufacture of coke; but almost any coal may be used in the blast furnace. It is possible that peat or any other carbonaceous material, capable of being pulverized, may be successfully employed.

BOOK REVIEW.

The Mineral Industry, Its Statistics, Technology and Trade During 1917. Edited by G. A. Roush and Allison Butts, McGraw-Hill Pub. Co., New York. Price $10 net.

This is the 22nd volume of "The Mineral Industry." It contains information regarding the production of all countries for which statistics could be obtained. The greater part of the volume is devoted to the mineral industry of the United States; but foreign countries also receive considerable attention and an attempt has been made to present information concerning all mineral producing countries.

Many contributors have assisted in compiling the book, and most of the chapters include special articles by men well qualified for the task. The minerals are treated in alphabetical order, separate chapters being devoted to all the more important minerals or groups of minerals.

There are also special chapters devoted to, ore dressing and coal washing, data of the world's principal mines and mineral statistics.

As in previous volumes a wealth of information is included in this volume. It will be found referred to even more often than the earlier volumes owing to the many changes that are taking place in the industry owing to the war and to the return to peace conditions.

Mine Tracks, Their Location and Construction. By J. McCrystle. McGraw-Hill Book Co. Price, $1.50 net.

This little book is designed to furnish those in charge of trackwork and the laying out of trackwork with the necessary data in convenient form. The several chapters are headed: rail, ties, projection of haulage roads, grades, gravity grades, frogs and switches, locating the turnout and book of rules. As most books deal with standard-guage track, this one should be welcomed by those who want information about narrow-guage track.

Handbook of Mineralogy, Blowpipe Analysis and Geometrical Crystallography, by G. Montague Butler. John Wiley & Sons, New York. Price $3.50.

This book includes a second edition of "A Pocket Handbook of Minerals," and a first edition of "Pocket Handbook of Blowpipe Analysis," and "A Manual of Crystallography," 311 pages are devoted to the first part; 80 pages to the second, and 155 to the third. There is a separate index for each part. There are a number of tables for use in determining minerals by their physical properties.

The information given in this book is such as will help the user to identify minerals. The book is not intended to be used as a manual of mineralogy. An attempt is made to emphasize the features most useful for determination, rather than to state properties in detail.

Mill and Cyanide Handbook, by A. W. Allen. Charles Griffin & Co., London. Price 6s. net.

This is a book of tables for the use of those who are engaged in the milling of ores. The tables are arranged in sections under the following heads: technical chemistry and physics; weighing, measuring and estimating; experimenting and testing; crushing, regrinding and amalgamation; treatment of ore pulp; precipitation, clean-up and bullion recovery; conveyance of ore, pulp and solution; miscellaneous tables. In addition there are treatment charts, solution charts, clean-up charts, titration charts, report forms, construction costs and a glossary.

It should prove a useful handbook for the mill man.

Lightning River Gold Area and a Remarkable Series of Lava Flows

By A. G. BURROWS and C. W. KNIGHT.

In pursuance of instructions received from the Provincial Geologist, Dr. Willet G. Miller, the authors spent the summer of 1918 examining the recently discovered gold deposits in what has been called the Lightning river area, which lies directly south of Upper Lake Abitibi, Timiskaming district, Ontario. Our work covered an area of eight townships, the eastern limit of which was the interprovincial boundary between the provinces of Quebec and Ontario.

The boundary lines of the eight townships were surveyed during the summer of 1918 by Provincial Land Surveyor H. J. Beatty, but the lot and concession lines were not run. Consequently our geological mapping was, of necessity, more or less of a reconnaissance nature. The newly surveyed townships, Frecheville, Garrison, Harker, Holloway, Lamplugh, Marriott, Rand and Stoughton, were named after men well known in the mining and geological world.*

In this paper the account of the gold deposits and of other economic aspects has been written by Mr. Burrows, while the general geology has been described by Mr. Knight.

Gold was discovered in the Lightning river area in August 1917 by Messrs Howey, Cochenour and Willans. At that time it was a difficult matter for prospectors to get into this little-prospected area. During last summer, however, a rough road was built from near the Croesus mine into the Howey-Cochenour-Willans claims, this road being a continuation of the road which runs from Matheson to the Croesus mine. From Matheson, on the T. & N. O. Ry., to the Howey-Cochenour-Willans prospect, it is more than 40 miles by road. The area may also be entered by going to La Reine, north of Upper Lake Abitibi on the National railway. La Reine is 72 miles east of Cochrane, and is in the Province of Quebec immediately east of the interprovincial boundary. A gasoline boat may be taken at La Reine, and Upper Lake Abitibi reached by going down the Okikodasik river, a distance of about 5 miles. From the mouth of this river it is about 17½ miles southwest across Upper Lake Abitibi to the mouth of the Lightning River. A small gasoline boat may be taken about six miles up the Lightning river to the place where the river forks, at which point a trail about six miles long leads south directly to the Howey-Cochenour-Willans prospect.

The rocks in the eight townships covered by us consist almost entirely of greenstones, which are nearly always massive, and seldom are altered to schists. The greenstones consist mainly of basaltic or andesitic lava flows, interbedded with which are pink or grey acidic flows, probably for the most part rhyolites. All of these rocks have been considered to belong to the Keewatin series. We were fortunate in discovering in the southwest part of Holloway township an area in which the rocks are so little altered that we were able to recognize and map an orderly succession of lava flows, the tops and bottoms of the flows being found, and their thickness measured.

There are other rocks present besides these Keewatin lavas. We found here and there throughout the area dikes of feldspar porphyry and diabase cutting the Keewatin. There are also dikes or other masses of serpentine rock cutting the Keewatin.

In addition to these dikes there are larger intrusions of igneous rocks. For instance, Ghost mountain is made up of a great intrusion of diabase, presumably cutting the Keewatin lavas, about five miles long and more than a mile wide. This mountain rises some 660 feet above the Lake Abitibi, and is the most striking topographical feature in the area.

In Garrison Township there is an intrusion of pink hornblende granite, syenitic in places, a few square miles in extent, and also a much smaller, though coarse-grained and very beautiful syenite intrusion in Harker township. Both these masses intersect the Keewatin lavas.

Little is known about the age relationship of these various intrusions, one to another, since we rarely found them in contact with each other. We were able to prove, however, that along the shores of Upper Lake Abitibi certain of the feldspar porphyry dikes are older than certain diabase dikes. All of the intrusions, including dikes of porphyry, diabase, serpentine, and bosses of granite and syenite, cut, and are therefore younger than, the Keewatin lavas.

While most of the rocks in the area are igneous, there are small outcrops of iron formation, and also of volcanic tuffs and breccias. In the northern part of Garrison township, for instance, an iron formation strikes in an easterly direction. Its extent is not known since it occurs partly in low or swampy drift-covered areas. Iron formation also occurs along the south shores of Upper Lake Abitibi, while in Boundary bay we found some bedded tuffs and breccias with at least a thickness of 60 feet.

Carbonate rocks occur in the heavily drift-covered valley of the Mattawasagi (Teddy Bear) river, and in other places.

Lava Flows in Holloway Township.

In the southwest part of Holloway township, about 10 miles south of the shore of Upper Lake Abitibi, there is a remarkable series of lava flows, presumably of Keewatin age. The flows have been tited into almost vertical positions, and now dip at an angle of about 80 degrees to the south. Their upturned edges strike a little south of west. The time at our disposal was not sufficient to work out the length of the flows, but it was found that one of them extends for at least five miles in an east and west direction. The older flows occur at the north; in other words, younger flows are successively met with towards the south.

The lava flows indicate the great volcanic activity which existed in this part of the earth's crust in ancient times. Even our hurried work showed the presence of 14 distinct flows having a combined thickness of about

*Can. Min. Jr. May 1st, 1918, p. 146.

4,400 ft. In this thickness of 4,400 ft. there may be more than 14 flows, but owing to lack of time, and to the soil which covers the rocks in many places, we did not recognize more than 14 flows. Unquestionably the total thickness of the lava flows must be enormous, since similar volcanic rocks extend for ten miles to the north as far as the shores of Upper Lake Abitibi, and are reported by prospectors to occur for miles to the south.

The thinnest flow noted was about 27 feet, the thickest being hundreds of feet.

For comparative purposes it may be pointed out that the lava flows of the Keweenawan series in the Lake Superior region vary from about two feet to those which are 100 feet or more in thickness. In only two instances do they reach a thickness of 500 feet. The thin flows are not of great length, nor, for the most part, are the thicker flows. The greatest distance which a single flow has been followed is 30 miles. In some parts these Keweenawan flows in the lake Superior region have a total thickness of 23,000 feet.*

The volcanic rocks in Holloway township are indisputably stamped with the characteristics distinctive of lava flows. The most striking of these characteristics is the ropy, slaggy and at times half glassy nature of the tops of most of the flows. Sometimes the tops present a fragmental appearance. This appears to be due to the fact that the surface of the flows was the first part to solidify into a more or less thin crust, and that this solidified crust then broke up, and allowed the liquid rock from below to well up and cement the broken fragments. No doubt this process may have continued over and over again. Other characteristics, which we found for the most part abundantly developed, are the amygdaloidal, vesicular, scoriaceous, spherulitic and flow textures. Of common occurrence also are the pillow structures, which are developed in the basalts, but not in the rhyolites. Another interesting feature of these volcanic rocks is the occurrence of what are known as lithophysae, which consist of a series of concentric shells, resembling somewhat nested watch glasses.†

Columnar Structure in Diabase Dikes—Lightning River Gold Area.

In order to prove beyond question that we were dealing with a series of lava flows and not a number of parallel dikes we made a special search for the actual tops, or surfaces, of the flows. In nearly all of the fourteen flows we found these tops. The bottoms were also generally found. It was seen that the dense, fine-grained bottoms were chilled and frozen against the

†Pirsson, Rocks and Rock Minerals, p. 264.

Prospectors in Lightning River Gold Area, Sept., 1918, at Howey-Cochenour-Willans Claim.

ropy and slaggy tops. If further proof were needed, to show that we were dealing with lava flows, it is found in the study of each individual flow. For instance, the bottom of the basaltic flows are generally dense, fine-grained, sometimes amygdaloidal rocks; as the centres of the flows are approached the rock becomes coarser in grain, even as coarse as a medium-grained diabase. As the top is approached the flow becomes finer in grain, amygdules begin to make their appearance, and finally the rock assumes the ropy, slaggy and scoriaceous features which are characteristic of the surface of many lava flows.

The thickness of the ropy tops varies in the different lavas; in the flow in front of the office of the Howey-Cochenour-Williams gold prospect the ropy surface makes up almost half of the flow, the ttoal thickness of the flow itself being about 27 ft. In other instances these ropy surfaces attain a thickness of as much as 40 ft., in which cases the flows themselves are hundreds of feet thick. Sometimes the ropy surface is only a few feet thick.

The lava flows briefly described above are in an unusual state of preservation in so far as their textures and structures are concerned. The ropy, slaggy, scoriaceous, amygdaloidal and other characteristics are all easily recognizable. This is due to the fact that the rocks, although they have been tilted up into almost vertical positions, have not been subjected to those severe processes of metamorphism which alter them to schists. They, as a consequence, retain their massive characters.

Of the fourteen flows which were worked out three are acidic varieties, which may be called, in a general way, rhyolites, while the remaining eleven are basalts or andesites. Two of the rhyolites are light pink in color on weathered surfaces, while the third rhyolite has a pink to dark grey, or at times greenish, color. The basalts are all dark green in color.

The discovery of these flows in Holloway township is of unusual interest. In no other area of Keewatin rocks in the Province of Ontario has there been found such an orderly succession of flows. Of course it has been believed that the Keewatin was composed of a series of lava flows, since the textures of the rocks pointed clearly to their volcanic nature. Nowhere, however, had the tops and bottoms of the flows been found, and the flows mapped in detail. The Keewatin

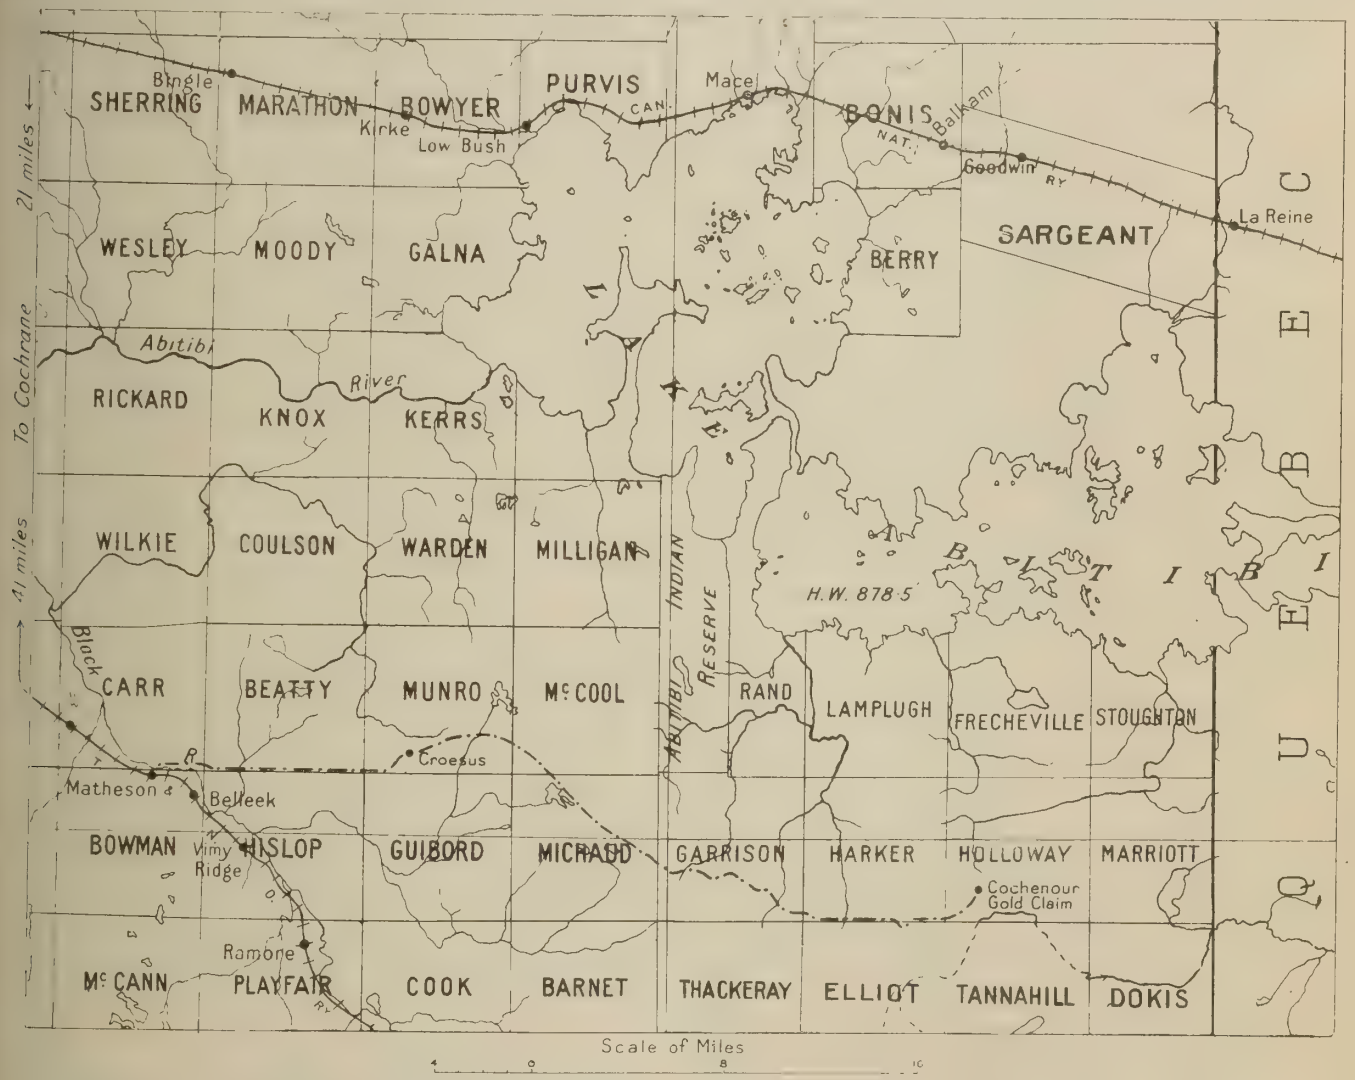
was simply known as a chaotic tangle, consisting largely of volcanic rocks, to which stratigraphic methods could rarely be applied.

Whether the flows in Holloway township really belong to the Keewatin, or to a younger series of rocks, cannot be dogmatically stated. Until it is proved that they do belong to a younger series, we prefer, in the meantime, to class the flows as Keewatin in age.

Economic Geology.

The chief interest in the area centres in its gold discoveries, and while a few claims have been partly prospected, on the whole only a limited amount of work has been done, due to the lack of prospectors and the distance of the area from a railway.

Most of the work has been done in the southwest



part of Holloway and the southeast partof Harker, these townships being adjacent.

Howey-Cochenous-Willans Claim.

Work on the Howey-Cochenour-Willans claim, No. 7135, has been largely confined to an examination of the vein in which the original discovery of gold was made in August, 1917. This vein has been traced by means of pits and trenches a distance of 175 ft. At the westerly exposure it is in the basalt, and at the easterly exposure in the rhyolite. At the west outcrop in the basalt an incline shaft has been sunk on the vein where the dip is 23° south. When the property was last visited by us the shaft had reached a depth of 35 ft. and the vein was still in the basalt, which rock lies to the north of rhyolite, the strike of the contact of the two rocks being to the south of west and the dip being about 80°S. From information furnished by Mr. J. W. Morrison, who was manager of the property at that time, it has been learned that when the shaft penetrated the contact of the basalt and rhyolite the low dip of the vein was maintained, and the contact between the rocks has been displaced a distance of four feet on the plane of the vein. This evidence points to the formation of the vein along an inclined fault that intersected the rock formations.

The vein structure, as revealed in the shaft to a depth of 35 feet, shows a main persistent quartz vein, varying in width from an inch to 10 or 12 inches, with an average width of about 4 inches. Roughly paralleling this main vein there are a number of narrow quartz veinlets usually less than an inch in width and more or less discontinuous, the whole partaking of the character of a sheeted zone produced by shearing that accompanied the formation of the fault. This zone varies in width from about 2 to 3 ft. The quartz veins carry considerable calcite often of a pink color, and also pyrite, chalcopyrite and zinc blende. In the main vein the pyrite, which is the most abundant sulphide, frequently occurs in a roughly banded arrangement, parallel to the walls, and is also concentrated between the quartz and the wall rock. Fragments of country rock occur in the vein and are said to be more numerous as the contact between the basalt and rhyolite is approached.

The gold usually occurs in a fine condition with the

pyrite, but samples from the main vein often show gold in the quartz visible to the eye.

The rock adjacent to the veins has been mostly replaced by silica and carbonate solutions, accompanied by iron pyrites. Samples of the replaced rock effervesce strongly with the acid. Away from the veins the original lath-like structure of the plagioclase feldspars is well preserved.

The shaft is reported continued to a depth of about 70 ft., and work was stopped after the rhyolite had been been penetrated for 20 ft.

The rhyolite contains scattered crystals of iron pyrites and on the surface to the south of the shaft there are numerous loose fragments of the rock. Native gold has been observed in some of the fragments. We were informed that from a number of assays of the surface rhyolite an average assay value of about $1.50 in gold per ton was obtained. From a few samples taken by us we were able to confirm the presence of low values in the rhyolite. Similar low values have been reported in this rock from a number of places along the band of rhyolite for 5 miles. Some work has been done on quartz xeins that carry iron pyrites occurring in this or a parallel band of rhyolite.

Taylor-Horne Claim (7261)

This claim is located in Holloway township adjacent to the west boundary of the township. Here there is a quartz vein with strike. N 82° E. that can be traced for 125 ft. east from the boundary line to the edge of a bluff rising from the drift. The vein dips 75° S., is narrow and varies greatly in width. At the easterly exposure it is 8 inches wide where a shallow pit has been made. At another point it is 4 inches in width and well mineralized with iron pyrites, zinc blende and galena. Some visible gold was observed at one point in the vein. The enclosing rock is altered basalt. Some selected material from this vein gave on assay to $4.40 in gold.

Cochenour Claim (in Harker township).

This claim joins the Taylor-Horne claim on the west side of the boundary line. Work has been done on the strike of the Taylor-Horne vein, which towards the west diminishes in width. On the Cochenour claim there is a mineralized zone, but with very little vein quartz exposed. The basalt, which is the country rock, has been greatly impregnated with silica and carbonate solution and iron pyrites over a width of from 5 to 10 feet. A little native gold was observed in a joint plane in the altered rock 230 feet west of the boundary.

McDonald Claim (7324).

On the McDonald claim some surface work has been done on 3 quartz veins in the rhyolite. These veins from 2 to 10 inches in width carry iron pyrites and copper pyrites. This prominent vein, which strikes N. 15° E. and dips 75° easterly, has been traced on the surface for 150 ft. Some native gold has been reported from this vein and values of $8.40 and $7.60 in gold were obtained from samples of quartz and rhyolite, carrying iron pyrites.

Reference has been previously made to the general character of the rocks in the area south of Abitibi lake. These rocks, largely of a basic character, basalt and diabase, are very similar to the massive basic rocks that occur in the vicinity of the Croesus mine in Munro township, where in 1914 a quartz vein carrying the richest gold ore yet found in Ontario was discovered. It is possible that in the area to the east, which so far has been little prospected, other gold deposits of a similar character may be found.

Magnetic Declination in Holloway and Frecheville Townships.

Along the north boundary of Holloway township the compass was found to have an unusual variation at and near the contact of an intrusion of serpentine which cuts Keewatin lava. The Keewatin here forms a prominent hill known as Lightning mountain about two miles east of the Southwest corner of Frecheville township. At the foot of Lightning mountain, on the southwest side, the mass of serpentine referred to is found striking about west 30° north. The greatest variation of the compass is 95° west of the true astronomic north, and occurs about at the contact of the serpentine and Keewatin. It is evident that the variation is due to the serpentine rock, since the variation falls as one leaves the contact. The only apparent cause for this unusual declination appears to be due to the presence of a very little magnetite in the serpentine. Analyses of the serpentine for platinum, chromium and neckel gave negative results.

We also found a heavy magnetic declination along the south boundary of Rand township in a swamp. The declination is as high as 36° west of north astronomic The south boundary of this township being drift-covered it was not possible to discover the cause of the declination. However, there is an iron formation about a mile south of the boundary. If this extends north, below the drift, it probably would account for the declination.

Surveyors while engaged in outlining or subdividing townships, occasionally refer in their notes to unusually high magnetic declinations, indicated by local disturbance of the compass needle, that is due to the proximity of such deposits as magnetic iron ore, serpentine, or pyrrohotite. Reference to local disturbance in the notes accompanying the survey of Reaume led prospectors to examine this township, which is largely covered with drift, resulting in the discovery of some deposits of chrome-bearing serpentine. The discovery of the Alexo nickel mine is directly due to the reference by surveyors in their notes to the unusually high magnetic declination observed in the townships of Dundonald and Clergue. Alex. Kelso, a prospector, knowing the significance of the unusually high magnetic declinations referred to, carefully examined the area, and found the deposit of nockel-bearing pyrhotite in serpentine afterward known as the Alexo nickel mine.

Mr. N. T. Bothwell, who has been in charge of gold-quartz mining operations in Alaska during the past summer, is in Winnipeg for a few days. Mr. Bothwell intends to continue operations as soon as the spring break-up comes.

Mr. J. B. Tyrrell has been nominated for the presidency of the Canadian Mining Institute for the coming year. Mr. Tyrrell is chairman of the Toronto branch of the Institute.

Mr. C. E. Smith has not accepted the nomination for election as a councillor of the Canadian Mining Institute for the coming year. It is probable that Mr. Geo. Mackenzie, of Ottawa, will be nominated.

Mr. T. W. Carvers is at Copper Cliff. He is interested particularly in the use of coal dust as a substitute for coke in blast furnaces.

The Graphite Industry

By CHARLES SPEARMAN.*

The mineral graphite, generally speaking, is widely distributed throughout the world, deposits being found in Canada, United States, Mexico, Ceylon, Siberia, Madagascar, Greenland, Norway, Finland, etc.

Graphite crystallizes in the rhombohedral division of the hexagonal system, usually in six sided tabular crystals which at times may have the appearance of being circular or elliptical in outline; may also occur foliated, radiated or columnar; may be granular to compact, earthy, scaly or flaky; has a perfect basal cleavage, greasy feel, metallic lustre; is opaque, flexible but inelastic, steel gray to black color; hardness is 1-2; Sp. gr. 2.24. Graphite is essentially carbon, but in its purest form contains volatile matter and ash usually less than 1%. The streak is black. Graphite is a conductor of electrically. Its fusibility is probably about 3,000 deg. C. The mineral is combustible at 650-700 deg. C. Crystalline graphite may be oxidized to graphitic acid $C_{11}H_4O_5$, while the artifical amorphous substance cannot.

Amorphous carbon is produced commercially from coke by the Acheson process. Schungite is the name applied to an amorphous variety of carbon sometimes found in the schists. There is considerable difference of opinion regarding amorphous graphite occurring in nature. Many contend that the so-called amorphous carbon is really flake graphite deposited in microscopic flakes or scales, or larger flake reduced to a state of fine subdivision by dynamic action, such as deformation of the deposit. A great many specimens of so-called amorphous carbon found in nature, examined by the writer, tend to bear out the above contention i.e. that which appears as amorphous carbon to the unaided eye actually shows the condition of a groundmass of microscopic crystals or flakes containing therein many flakes which are relatively large.

Some of the richest known Canadian graphite deposits are found in Eastern Ontario and Western Quebec or roughly speaking within a radius of one hundred miles of Ottawa. Most of the graphite in the above area occurs in large disseminated flakes of such size that practically all rest on a 60 mesh standard screen, the only exception to the above being the Black Donald Mine graphite at Calabogie, Ont. where a great deal of the flake in certain parts of the deposits is very small Judging from hand specimens it appears as though most of this fine flake would rest on a standard 90 mesh screen.

Flotation Process Replacing Old Dry Process.

About half a dozen miles for the concentration of graphite were built from time to time in the above area, some dating back to twenty years. In 1916 all were closed down, with the exception of one with a small output in Buckingham Tp., Que. and the Black Donald at Calabogie, Ont. The others attempted to concentrate by the dry process and failed. In 1916 or thereabouts, flotation began to play an important part in the concentration of graphite ores, and with such success that within a short time there will be flotation concentrators replacing the old dry processes in the various mills.

(*Consulting engineer, 4311 Montrose Ave., Westmount, Qué.)

The average graphitic carbon content of the Black Donald ore is much higher than that of any within the area mentioned, averaging about 30-35% graphitic carbon; the remaining properties on which, comparatively speaking, little development has been done outside of open cutting, should average about 8% or better graphitic carbon if developed to that end. The Globe Graphite Mining and Refining Co., Ltd., at Port Elmsley, Ont. stands second to the Black Donald as far as development work is concerned. A full description of the last named property was published by Mr. M. E. Wilson of the Geological Survey in Summary Report, 1917, Part E.

According to Lindgren, graphite may originate in several ways; (a) it may for an integral part of rock magmas and crystallize with the rock, (this type is seldom of economic importance).

(b) it may be formed by the recrystallization of carbonaceous matter in metamorphic sedimentary rocks, (c) it may be formed by deposition from gaseous carbon compounds such as carbon monoxide or cyanogen compounds, perhaps with metals, and usually found in narrow veins.

In the Ontario-Quebec area referred to above, the graphite occurs usually in crystalline limestone adjacent to or at the contact with intrusive rocks of the acid type, generally pegmatites or their derivatives, i.e. rocks formed by the action of the intrusive on the intruded rocks. These deposits are characterized by their relatively large dimensions, 10′-100′ wide, where development has been carried out by diamond drill or otherwise. The graphite is associated with mica, pyroxene, scapolite, wollastonite, pyrite, quartz, etc. The deposits are as a rule quite irregular and more or less varied in carbon (graphitic) content. Regarding the origin, it would appear in most cases to be accounted for by a combination of (b) and probably (c) types above mentioned, acting upon the already deformed or disturbed country rock. The major crustal movement which made the intrusive possible incidentally caused zones of weakness adjacent to the zone of major movement, which zones were subsequently acted upon by emanations from the intrusive magma, probably pneumatolitic or nearly so in character, causing recrystallization of the carbonaceous matter of the crystalline limestone within the influence of the emanations, into graphite. The presence of quartz adhering to some of the flakes would indicate transportation of some material at least from the intrusive magma with possibly some graphite formed by the deposition of gaseous carbon compounds, (c) type above, of the intrusive. From the above it would follow that the size of the deposit would depend directly upon the extent or degree of deformation adjacent to the intrusive and the richness of the deposit depends directly upon the duration of the action. The duration of the action depends more or less upon the volume of the intrusive magma.

In the United States the greatest producing area is in Alabama, in the Ashland district of Clay county where the graphite occurs in a metamorphosed mica schist much weathered and decomposed so as to render mining comparatively easy. The deposits are from 10′ to 80′ wide, the flake is a fair average size; but the deposits are on the whole low grade averaging about

3-4% graphitic carbon. In Clay and Coosa counties there are about 60 mills with a rated total of about 7,000 tons per day, many operating, the remainder under construction. New York State is the second largest field in the U. S. Generally speaking the graphite occurs there in pre-Cambrian crystalline schists of sedimentary origin and averages about 5% graphitic carbon.

In Ceylon the graphite occurs in veins from 4" to 12" wide in a fine grained acidic or basic gneiss intruded by granites and pegmatites. The ore is high grade and is sorted at the mine and as marketed runs over 70% graphitic carbon. The graphite occurs in these relatively narrow veins in a fibrous or radiated structure with the long axis of the fibre normal to the walls of the veins. This graphite is remarkably pure and is much used for crucible manufacture.

In 1917 Alabama produced about 3,000 tons of graphite; New York about 2,500 tons, Pennsylvania and other United States areas 450 tons. The production for 1918 for the above areas is approximately the same as for 1917. Ontario produced over 3,000 tons in 1917 and about the same in 1918, practically all of which came from one mine, the Black Donald at Calabogie, Ont. Importations from Ceylon to United States in 1917 were 25,000 tons much of which was used to mix with domestic flake for the manufacture of crucibles. In 1918 this importation was greatly diminished by the placing of an embargo on the Ceylon product by the War Trade Board. In 1917 Madagascar produced 35,000 tons of which England and France used 28,000 tons. From 3,000-4,000 is produced artifically at Niagara Falls by the Acheson process and which is "deflocculated" and is used in oil as a lubricant.

Graphite for the market is usually graded according to purity and size of flake. No. 1 flake should be no smaller than 90 mesh standard screen, over half of which should rest on a 50 mesh standard screen, all or nearly all pass through a 16 mesh standard screen, and contain 85-90% graphitic carbon or better. No. 2 flake should rest on 120 mesh standard screen and pass through 90 mesh standard screen and contain 75-80% graphitic carbon, while all flake which passes through a standard 120 mesh screen is known as No. 3 and contains from 40-70% graphitic carbon. No. 1 domestic flake in 1918 sold at 17-22 cents per pound; No. 2 domestic at 13-15 cents per pound while the lower grades sold at from 3-11 cents per pound. The present price is somewhat lower than the above for domestic product, but with a better domestic grade going on the market it is likely that the price will remain quite steady.

A great deal of the domestic No. 1 flake is used in the manufacture of graphite crucibles, usually mixed with Ceylon graphite in the proportion of 30% domestic to 70 per cent Ceylon Graphite flake for crucible manufacture must meet with the specifications enumerated above and, in addition, must contain little or no basic gangue which would flux the clay which is used in the art. The flake must not be thin, light or fluffy or it will not shake down to the requisite density when in bulk, and will thus possess too great a percentage of voids which must be filled with clay in the manufacture of the crucible. A crucible with too much clay in its make up loses its conductivity for heat and requires a greater heat to carry out the operation and consequently at a greater cost. Hence the more dense the mass of finished flake taken as a whole the better suited it is for crucible manufacture, other features being equal. In explanation of the above I would quote the following test; 100 grams of Alabama No. 1 flake, shaken down, occupies about 150 c.c.; the same weight of Canadian No. 1 flake occupies about 135 c.c. while the same weight of Ceylon flake occupies about 91 c.c.; hence the Ceylon product makes a crucible with more graphite in its make up than could be made from the other products, for the same size of crucible. Experiments carried out on a commercial scale by the writer have resulted in the obtaining of a Canadian crucible flake, practically free from basic gangue and when subjected to the above standard test occupying about 101 c.c.. It can be made still more dense. This should make an excellent crucible stock as far as domestic flake is concerned, and further research along this line would mean much towards decreasing foreign importations to this continent, and greatly improve the American markets and assist the American industry.

Much graphite is also used in paint manufacture foundry facings, pencil manufacture, polishing powder, as an adulterant in fertilizers, etc.

From the preceding brief general summary of the graphite industry it is apparent that the Canadian area referred to has graphite deposits which are valuable, and field examination reveals the advisability of further exploration and development in order to bring the area into prominence as a world producer. This statement is based on evidence of numerous large and relatively high grade deposits already outcropping or shown by limited development work already done; nature of the flake contained in such deposits which is unexcelled commercially; accessibility to transportation by rail and water, cheap power, etc. Then there is the industry of manufacturing graphite products within the area, which merits a great deal of attention on account of the foregoing facilities. In fact this area presents qualifications for the development of the industry which no known area can duplicate.

TEMISKAMING BUYS DOLLY VARDEN.

Toronto, Feb. 3.

The shareholders of Temiskaming, at their annual meeting yesterday, consented to the proposal of the directorate, to extend the operations of the company, by taking over the Dolly Varden and Wolfe silver mines in British Columbia. These mines have been handicapped for some time by lack of finances, and Temiskaming has entered into an agreement whereby operations will be resumed. The purchase price of the property is $900,000, but the obligation to the former holders of the mine is only $450,000 because of the liabilities that Temiskaming has to assume. A narrow-gauge railway extending from the coast to Alice Arm to the Dolly Varden property is to be completed, and all debts will be met by the purchasers. According to the agreement, the vendors receive no payments on the purchase price, before the Temiskaming Company recoups itself for this outlay. The vendors will only be paid out of the profits.

The known ore reserves are said to be heavy, the properties, it is stated, having over two million ounces of positive ore in sight. The two properties lie within nine miles of each other, and both are said to be rich and extensive.

Temiskaming's annual statement was received and adopted at yesterday's meeting, and the old Board of Directors were re-elected.

Special Correspondence

NORTHERN ONTARIO.

Payment Made on Patricia.

A large cash payment on the purchase of the property of the Patricia Syndicate, at Boston Creek was recently made, according to official information. Advice is also to hand that an early resumption of operations at the property may be looked for, owing to the improved economic condition and better supply of labor. The small mill on the property was closed down early in the winter owing to the difficulty in securing fuel for its operation. Last week it was announced the Mining Corporation of Canada and also Detroit interests were negotiating for the purchase of the property, but so far nothing definite has transpired.

Exploring Skead Township.

Evidence points to a considerable increase in mining activity in Skead Township area during the coming spring and summer, and even now a number of properties are being worked in a more or less extensive way. Gold has been found in various sections of Skead township and in some instances spectacular gold values were found. Chief among the mining operations under way in the district at present is the Skead Gold Mines Limited. This company owns more than a score of claims on which work has been commenced. The Wisconsin Mining Company owning property in the district has engaged a number of men for the putting in shape of the mining plant, with the intention of resuming operations early in March. Plans are under way for a fairly extensive exploration of the vein system. Owing to the distance the new field lies from the railway, the development of the district has not been as rapid as the showings would appear to warrant. The coming summer, however, appears to mark the beginning of an aggressive period of development and those interested in the district are very optimistic at the outlook.

Will Resume Work at White Reserve.

Tenders are being called for 150-ft. of drifting at the 140-ft. level of the White Reserve property, in the Maple Mountain section. Arrangements are being made for an early resumption of mining operations at the property. Considerable development has been accomplished on this property and results to date have been very encouraging.

Development Plans for Miller-Independence.

The work of surveying and sampling the Miller-Independence Mines at Boston Creek has been completed. While no official report of the extent of the rich orebodies as so far opened up has been given out, it is stated the assays check up well with previous optimistic statements made. The consulting engineers have been so favorably impressed as to advise the sinking of the present shaft to lower levels. The recommendation is to the effect that the present shaft be continued from the present level of 200-ft. to a depth of at least 500-ft., with large stations at the 300 and 400-ft. levels, from which points lateral work is advised. The management is making preparations to carry out this work with the least possible delay. The shaft from the surface down to a depth of 40-ft. is being lined up with the remaining portion of the working which has reached a depth of 200-ft., and which has an incline of about 51 degrees. A concrete cellar will be placed at the mouth of the shaft. Two additional drilling machines have been placed on order and will be used for the purpose of sinking the shaft, while the present machines will be free for the carrying on of further development work. The shaft will be timbered and additional machinery installed to facilitate the hoisting of the ore. The shortage of labor appears to have bene overcome and as ample funds are available for the development of the property and erection of a large mill, there appears to be nothing to prevent the carrying out of the large plans of development recently outlined, and the placing of the property on a producing basis in a reasonable time. The small mill installed on the property has been satisfactory as a testing plant, for the testing of the ore in the mine as the various levels of the property are opened up. The high grade nature of the ore makes it unwise to use the present milling system for treatment. It is thought this plant will eventually serve as a customs mill for a number of the smaller properties opening up close to the Miller-Independence. The increasing importance of developments at the mine presage a bright future for the property at the coming spring and summer will see long strides made in the proving of the rich orebodies, the limits of which at the present time can only be guessed at. From what has been so far proven it is the opinion of many prominent mining men that the Miller-Independence operation is one of the most important in the annals of gold mining in the Dominion of Canada.

Gowganda.

A deal for the Walsh property in Gowganda, involving a sum said to be well up in six figures is under way. This silver property was under option to the Crown Reserve Mine of Cobalt and development work was carried to a depth of 200-ft. Owing to a very large payment falling due and terms not proving satisfactory, the option on the property was allowed to lapse. The Walsh lies adjacent to the famous Miller Lake-O'Brien mine and the geological conditions are very favorable for the encountering of silver deposits of importance.

Teck-Hughes Increases Output.

The December output at the Teck-Hughes Mine in Kirkland Lake is the highest in the history of the company. During the month some 2,035 tons of ore were treated, from which an average of $10.12 per ton was recovered. It was officially stated that the grade of ore to be treated in the future at the Teck-Hughes would be higher than in the past. The reason given for this is the fact that the ore encountered in the course of development has been conveyed to the mill and does not represent the average contained in the main orebodies of the property. One orebody in the mine has been opened up for a distance of 400-ft. and a depth of 600-ft., showing a width of thirty-seven feet at its widest point. It is further stated officially that one of the main orebodies of the mine has an average value of between $11 and $12 per ton. The mill on the property is designed to treat between 100 and 120 tons of ore daily when brought up to full capacity. The outlook therefore is for an output of upwards of $30,000 per month when operating at capacity.

Porcupine V.N.T.

Reports to the effect that the Porcupine V.N.T. property was about to be re-opened have been officially denied. Following the curtailment of operations last year, the lower workings of the mine were permitted to fill with water. It is therefore not probable that any action towards a resumption of work will be undertaken until the spring arrives.

McRae Porcupine.

Arrangements are understood to have been about completed for the further opening up of the McRae-

Porcupine property in the township of Deloro. Considerable work has previously been done on this property, and the results have been promising.

Porcupine-Keora.

Plans have been completed for a resumption of operations at the Porcupine-Keora property in the northern part of Whitney township. The preliminary work to be undertaken will consist chiefly of diamond drilling with the conclusion of which underground work will be started. Considerable success was met with in the diamond drilling of the Keora upwards of two years ago, when this work carried to a depth of 800-ft. Orebodies of a substantial width which are said to contain commercial values were cut.

Hunton-Kirkland.

It is understood interests closely identified with the McKinley-Darragh mine are connected with the purchase and development of the Hunton-Kirkland property at Kirkland Lake. Plans are under way for the installation of a steam plant for the exploration and development of the property, and work is to be commenced early in February.

Cheaper Supplies.

Striking evidence of the decline in the cost of mining materials is borne in the fact that steel plate which not long ago was on the market at 12 cents per pound can now be purchased for six cents. Copper wire has also declined nine cents per pound in the past few weeks.

McKinley-Darragh's new orebody.

The McKinley-Darragh mine ore shoot recently discovered at the 300-ft. level of the property near the old Princess property of the LaRose Mine continues to prove up well under development. Some rich ore occurs along the vein which has been opened up for a distance of fifty feet, in addition to the high grade being encountered there is a considerable tonnage of low grade mill rock in the wall rock. It is expected the vein will be picked up in the level above the present point of operation.

Good Ore at Adanac Mine.

The persistent efforts of the Adanac Mining Company have at last been crowned with success. The ore shoot at the 310-ft. level has been opened up for a distance of fifty feet, the vein showing a uniformity of width during the last few rounds of shots, and has every appearance of continuing for a considerable distance. The high grade portion of the vein runs from six inches to one foot in width, carrying values from one thousand ounces up to five thousand ounces to the ton, with an average value of approximately one thousand five hundred ounces to the ton. Besides this high grade vein the wall rock on both sides of the vein carries good milling ore, considerable leaf silver and ruby silver being in evidence for several feet from the main portion of the vein. Arrangements have been made for the hauling of ore to the Temiskaming mill which adjoins the Adanac, and a trial run of between fifty and sixty tons will be made as a preliminary to steady production. The length and breadth of the present ore shoot affords ample opportunity for the commencement of stoping operations, and this work will probably be commenced at an early date. An additional machine is to be employed in the mine next week which will increase the speed of development. A contract for the hauling of the ore to the Temiskaming mill has been let at 60 cents per ton for the time being, but it is expected a considerable reduction in this rate will be effected in the near future.

Tough-Oakes.

It is anticipated that any possible further litigation in the affairs of the Tough-Oakes Mining Company of Kirkland Lake, will not hinder the affairs of the Company. It appears to have been definitely established at the recent annual and special meeting of the company that the Foster control was at an end. However, it is possible the present controlling interests of the company will demand an accounting of the affairs of the concern during the past three years in which control was in dispute. The present directorate of the company holds that the former directorate are solely and entirely responsible for the present condition of the property, and the present directors have not had the opportunity of investigating the situation. Any dispute along this line or legal action taken should not hamper the development of the mine from this date forward and it is expected the development of the mine and subsequent opening of the mill will soon result in large earnings.

Hollinger's Construction Program.

A large construction program is being mapped out by the Hollinger Consolidated Gold Mines at Parcupine, including the immediate erection of some fifty houses for the accommodation of workmen. The early commencement of an additional 100-ton unit to the present 2,800-ton mill is also expected to be considered before long. Since the commencement of the war a 1,000-ton unit has been added to the plant, and an additional 1,000-ton unit will be installed. This work had been planned previous to the war. However, lack of labor and high cost of material consequent of the war led to the latter addition to the mill being left until a more opportune time. At the present time men are pouring into Timmins in large numbers, and housing accommodation in the town is being taxed to the limit. The whole district is teeming with activity and the probability is that with the coming of spring conditions warranting the construction of the extra milling facilities will have arrived and the work should be under way early in the summer. The Hollinger mine is the mainstay of the town of Timmins and with the enlargement of this and other properties in the district, the town of Timmins is now a thriving hive of industry. There is every evidence that the present town will soon be swallowed up in a big city, which the mining industry and its demand for labor will create. Even now the number of new buildings being constructed and planned will go a long way towards changing the present appearance of the town and giving it a long step towards cityhood.

Mining Commissioner T. E. Godson, K.C., has completed his January sitting in Haileybury, and returned to Toronto.

Mr. A. Brant, manager of the Porcupine-Keora Mine in the township of Whitney, went north last week to reopen the mine.

Plans are being arranged for the resumption of work on the Baldwin property, near Kenogami station in the Kirkland Lake district.

Plans are being made to resume work on the Murray-Mowgridge property, in the Wolfe Lake district a few miles east from Bourke's Siding.

BRITISH COLUMBIA.

Testing Breathing Apparatus.

Acting on instructions from Hon. Wm. Sloan, Minister of Mines, the Chief Inspector of Mines of British Columbia has arranged for a series of practical tests of the efficiency of the Gibbs Mine Rescue Apparatus and the Paul Breathing Apparatus. These will begin on Tuesday, the 28th of January, at the Government Mine Rescue Station at Nanaimo, and continue until the efficiency of the machine is thoroughly demonstrated.

Activity at Trail Smelter.

Notwithstanding the present unsettled condition of the metal market, Trail, B.C., the home of the smelting plant of the Consolidated Mining & Smelting Company of Canada, is as busy now as it was some months ago, and has more men on its payroll. The explanation of this, in a few words, is that the management is preparing for the time, expected soon, when the work of reconstruction will make itself felt in the demand for the product of the plant.

Plant for Treating Tailings.

To be ready to take the fullest advantage of the shortly looked for readjustment and the return to the normal, there is considerable to be done at Trail. This was forecasted in the annual reports of the company's officials, which were issued recently.

One of the most important things in mind is the construction of a concentrating plant in connection with the zinc plant for the purpose of treating the tailings of the Sullivan mine and other silver-lead-zinc ores after they have passed through the zinc electrolytical process. There is an immense quantity of this residue which has been accumulating ever since the process for the recovery of zinc was installed, because there was no known, economically practical method, of extracting the lead-content. Both Messrs. J. J. Warren, the Company's General Manager, and S. G. Blaylock, his assistant, have stated that this vital problem has been solved by their own chemists. If this is so, and officials in question are evincing their faith by proceeding with the necessary installations, its importance to the mining industry of Eastern British Columbia, where the refractory ores of the Sullivan mine are found repeated in many other promising properties, can scarcely be over-estimated. It is said that the method by which the said tailings are to be handled is a combination of the concentration and leaching processes. Its success means the continued production of spelter at Trail at a cost which will permit in all probability its being placed on the market in competition with the products of other American smelters which are handling less complex ores because the lead content also will be available. This, therefore, is one of the works that the Trail Smelter management is engaged in and which, to some extent, accounts for the activity referred to at the outset.

Enlarging Copper Refinery.

A second matter, and also one of first importance, which is receiving attention is the enlargement of the copper refinery to provide for a daily minimum capacity of 50 tons. Present facilities permit the producing of not more than 20 tons a day. The concrete footings for this structure have been placed and the work wil go ahead as soon as weather permits.

The extension of the copper refinery plant at Trail is the logical outcome of the company's policy in acquiring the Voight copper claims, Copper Mountain, B.C. Of course, considerable development is necessary before this property begins to produce on a large scale, but, in the meantime, the Smelter is assured the concentrates of the Canadian Copper Corporation's mill at Allenby (near Princeton) B.C. The latter concern, which has made a large investment at Copper Mountain in the development of claims which adjoin the Voight claims (so-called), and the construction of a branch line from Allenby to the property and a mill at Allenby, has entered into an arrangement for the shipment of concentrates to Trail. Active work in the extraction of ore at this mine should commence within a few months so that the Trail Smeltery, with such a source of supply in addition to what is available from its own and custom properties, will have no difficulty in finding material for the augmented facilities of its copper refinery.

Alice Arm District.

The Alice Arm District of British Columbia is expected to develop into one of the large producing sections of the Province before long, it being the opinion of mining men that the Dolly Varden mine, which now is inactive because, owing to the failure of the Taylor construction company to carry out its contract relative to the construction of the railway from the coast to the mine, both the railway and the mine are tied up. The former is practically complete. When work ceased on it last autumn only five more days work would have found the terms of the charter complied with but, although within reach of the goal the company could do no more, and the charter has been allowed to expire. Considerable sums are owing to the workmen, and there also are large accounts outstanding for material. The owners of the mine have offered, according to well authenticated report, to pay these off providing the Provincial Government will renew the charter, which is an indication of faith in the mine very encouraging to all interested in the minerals of the section. It is confidently expected that the Government will take the action sought, in which event the line will be finished and its operation commenced. This, it is pointed out, will not only permit the Dolly Varden mine to undertake shipment of ore and further development, but will result, through providing transporation facilities, in opening up many other promising mining properties of the district.

Galena Farm Mine.

Eight carloads of ore have been shipped from the Galena Farm mine since Mr. W. J. Casey, of Los Angeles, Cal., became lessee of the upper workings, according to a report from Silverton, near where the property is situated. Three carloads were zinc concentrates and the remainder crude lead-silver, and all were produced from ore discovered in recent months above the intermediate tunnel level. The lead-silver ore has an estimated net value of $4,000 to the carload. The new ore is contained in a body 11 to 14 feet wide, disclosed in raises 150 feet apart on the intermediate level. The 14 feet of ore in the west raise includes two and a half to three feet of a shipping grade, while the 11 feet in the east is of milling grade xx. Drifts are proceeding on ore from the tops of these raises, which are less than 100 feet in heighth, eastward from the east raise and westward from the west raise.

Cork-Province Mines.

Cork-Province Mines, Ltd., operating mines and mill on the south fork of the Kaslo River, Kaslo, B.C., has concluded arrangements for refinancing, and expects to start operations early in the spring with sufficient capital to sink the main shaft 200 feet deeper and drive the main tunnel level into the third vein, which is particularly promising on the surface, and will be tapped at vertical depth of 700 ft. A letter has been addressed to the stockholders by the management stating that all metallurgical problems have been overcome, and that a successful run is confidently expected when operations are resumed. Running full time it is figured that the mine will earn a monthly profit of $12,000, based upon a lead and zinc concentrate output of 390 tons, worth $20,294 gross. These figures, it is explained, have been prepared with due allowance for the decline in price of lead, and present net value of zinc concentrate shipped to Trail, where no payment is made for silver content.

Developing Fluorspar Near Grand Forks.

Progress is being made in the development of the fluorspar property of the Consolidated Mining & Smelting Co., near Grand Forks, B.C. Eighty-two men now are employed there. The tram line being built to convey the ore from the mine to the bunkers for shipment is nearly completed, and is expected to be ready for operation this month. At the bunkers a mill is being installed which will grind the ore to almost flour-like consistency before shipment. The mill site is to be connected with the Kettle Valley Ry. by a branch line which is under construction.

COAL RIGHTS ON VANCOUVER ISLAND.

The Government of the Province of British Columbia has announced that it will stand by the settlers of Vancouver Island, who are claiming the coal rights in connection with the lands they occupy providing they can prove that such claims are based on sound premises. It will be recalled that the Dominion Government last year disallowed the Provincial Act giving the settlers a further period in which to record their applications, this measure being termed "An Act to amend the Settlers' Rights Act, 1904." One of the objections taken by the Federal Administration is that such legislation proposes to authorize the alienation of rights which were conveyed by the Province to the Dominion and by the Dominion conveyed to the E. & N. Ry. Company in consideration of the latter constructing a railway on the Island. Among other points advanced by the Provincial Government in its answer is that there is no difference in principle between the Act of 1917 and that of 1904, both being identical in character, and that the Dominion is inconsistent in disallowing the one and allowing the other to stand. This legislation, and the conflict which it has caused between the Federal and Provincial Administrations, involves title to considerable of the undeveloped coal areas of the Island. This is now, for the most part, in the hands of the Canadian Collieries (D), Ltd., to which company it was transferred by the Esquimalt & Nanaimo Ry Co.

THE SMELTER RATES INQUIRY.

At the opening session of the Committee appointed to inquire into the fairness or otherwise of the treatment rates charged on custom ores by the Consolidated Mining & Smelting Co. of Canada at its Smeltery at Trail, B.C., it was explained by Mr. S. S. Fowler, the chairman, that evidence either in the nature of criticism or suggestion would be heard from anyone. Such evidence might be given orally or in writing. It had been decided that, where witnesses made the request, their testimony would be heard "en camera" and would be treated as confidential. It was explained, in this connection, that some who might wish to be heard felt that, if they went before the Committee without assurance to the contrary, details of their mining business or of the concerns for which they were employed, would become public to the prejudice of such private interests. Members of the Committee, after taking the evidence of one witness behind closed doors, decided that they would visit the Trail Smeltery and meet representatives of the management of the company in order that necessary arrangements might be made for investigation of the conditions relative to the operation of the plant. A circular is being issued by the Committee for distribution among operators and mining men throughout the Province, explaining that the inquiry has been opened, and that evidence on the question will be welcomed from all who desire a hearing or are of the opinion that they have knowledge which will throw further light on the issue. In the meantime further indications that the inquiry does not satisfy a faction of the operating miners of Eastern British Columbia is furnished by a resolution passed by the Kalso (B.C.) Board of Trade, which explains itself and reads as follows:

"That this board place itself on record as not being satisfied with the appointment of a committee with limited power and authority for investigation into the matter of smelter rates and treatment of lead and zinc ores by the Consolidated Mining & Smelting Company's plant at Trail, and that we believe only by a Royal Commission can a complete and satisfactory investigation be made, and that copies of this resolution be forwarded to the Minister of Mines and the Federal Member."

Prospecting at Trail.

"Sandy" McDonald, an old Cariboo placer miner, has interested and surprised residents of Trail, B.C., by staking Camp Welcome, Claim No. 1, on the Columbia River, just opposite the town. His work is proceeding practically in full view of the populace of the smelting centre and he is said to already have recovered both fine and coarse gold. He professes confidence that, as soon as he has the ground properly opened up, he will be able to prove its value and, incidentally, to justify his faith.

Mr. D. A. Angus, of the Wright of Way Mines has returned from a trip to southern points.

JANUARY SITTINGS OF MINING COMMISSIONER.

The January sittings of Mining Commissioner T. E. Godson, have been concluded at Haileybury.

The dispute of John I. Ritchie, George T. Hamilton, and J. W. Myles vs. John T. Green, was a question involving discovery. An examination had been made by engineers of the department, as well as by the mining inspector. After consultation the litigants agreed to relinguish the restaked properties, the former claims to be reinstated and divided according to the terms of settlement agreed to.

Decision was reserved in the case of E. H. Horne vs. R. B. Morrehead, B. Babayah and Robert Carlyle.

In the dispute of J. A. Knox vs. C. Steveson, as well as the dispute between J. A. Knox and Peter J. Graham, owing to the illness of Stevenson, a material witness, stands over to the next sittings.

In the case of Horace Patterson vs. R. A. P. Mining and Development Company, the order of the applicant is to go as asked unless the respondents show cause forthwith.

A settlement is pending in the dispute between Peria et al vs. Kell and Ufland. An enlargement was asked for to permit settlement.

In the dispute between Joseph Harvey, jr., vs. Fred Egan, judgment was reserved.

ASKING FOR BOUNTY ON IRON ORE.

Ottawa, Feb. 3.

In support of a movement to encourage the mining of iron in Canada, representatives of the Boards of Trade of Port Arthur, Sudbury, Sault Ste. Marie, North Bay, Vancouver and other cities and towns will wait on Sir Thomas White, acting Premier, and other members of the Government at 12.30 p.m., to-morrow. The delegation will be introduced by Mr. F. H. Keefer, M.P., Parliamentary Under-Secretary of State for External Affairs.

The deputation will suggest that one dollar shall be paid for every dollar's worth of iron ore produced in Canadian mines. When iron and steel bounties were paid on the tonnage of pig iron produced in Canada, members of the deputation state, the amount of Canadian ore used in smelters was comparatively small, American ore being used mainly. If the $26,000,000 so expended had been paid in the way now suggested, the deputation believes iron mining in Canada would have been much more advanced than at present.

Miners Flocking to Gold Camps.

The trek of mine workers to the gold camps of Northern Ontario has become fairly general. Accommodation is being taxed to the utmost. The leading Porcupine mine is about to construct fifty dwelling houses in the town of Timmins. Various mines, closed down for from one to three years, are planning early resumption of work, and the gold output of this country may reasonably be expected to record a big increase during the current year. Before the end of the current year it is expected eight Porcupine gold mines will be producing gold, as against four at the present time. Likewise in the Kirkland Lake field similar increases are anticipated. Two mines are now producing, whereas before the end of the current year six are expected to reach the producing stage. In the Boston Creek district very satisfactory headway is also being made.

CENTRAL ELECTRIC POWER STATIONS IN CANADA.

A Census and Directory of the Central Electric Power Stations in Canada has just been completed by the Dominion Bureau of Statistics and the Dominion Water Power Branch of the Department of the Interior working in co-operation and with the assistance of the Ontario Hydro-Electric Commission, the Quebec Streams Commission and other Provincial Departments concerned. The Report is in two parts, Part I. comprising a complete census and statistical survey, with accompanying explanatory matter, whilst Part II. forms a comprehensive directory of all commercial and publicly-owned power stations in operation throughout Canada, showing the principal features of each, the locations where blocks of electrical energy are for sale, the price at which power is obtainable, transportation facilities available in the vicinity, etc. The collection of the data was made by the Bureau of Statistics and the Provincial Departments and the analysis and preparation of the data by the Dominion Water Power Branch.

The statistics include only central electrical stations, that is, stations engaged in the sale of electrical energy; all other electrical estabishments, such as electric railways, electro-chemical and other electrically operated industries, are excluded. Outstanding features of the report are as follows:

Capital and Labor.—The capital invested in central power stations totals $356,004,168, of which 79.5 per cent is invested in commercial stations and 20.5 per cent in municipal or publicly-owned stations. These figures indicate that the capital cost of central electrical station systems in Canada per primary horse-power installed is $193, averaging $196 per horse-power for commercial stations and $183 per horse-power for municipal or publicly owned stations. This cost includes all capital invested in construction and equipment of hydraulic works, power stations, transmission and distribution systems; real estate; cash on hand; current assets; sup-

The total employees connected with the industry, including officials and wage earners, numbers 8847, of which 58 per cent are connected with commercial and 42 per cent with municipal stations. The salaries and wages paid to these employees total $7,777,715 per annum.

Revenue.—The total revenue received from the sale of electrical energy is $44,536,848, of which $29,135,399 was secured by commercial and $15,401,449, by municipal plants.

Power Installation.—The primary power installation in central stations totals 1,844,571 h.p., of which 78.3 per cent or 1,444,314 h.p. is installed in commercial stations and 21.7 per cent or 400,257 h.p. in municipal stations. Of the total primary horse-power installed, 1,652,661 h.p. is derived from water, 180,800 from stream, and 11,710 from gas and oil.

The total primary power installed in central electric stations throughout the Dominion averages 221 h.p. per thousand population. Yukon averages the highest with 1,206 h.p. per thousand population, British Columbia coming next with 378 per thousand population, Ontario with 286 per thousand population, Quebec 271 per thousand population, Manitoba 118 per thousand population, New Brunswick 49 per thousand population, Saskatchewan 47 per thousand population, Nova Scotia 34 per thousand population and Prince Edward Island 13 per thousand population. Population by provinces is the only feasible basis available for making a per capita

analysis of the central station industry. The occupation of the population, and its varied density in different localities have a direct bearing on the market for electrical power, and consideration of these phases will assist in explaining the above variations in the per capita development.

Cost of Construction.—Of special interest is the actual cost of construction of hydro-electric power stations per installed horse-power. Omitting all real estate, transmission and distribution equipment, seventy representative hydro-electric stations throughout the Dominion, with an aggregate turbine installation of 745,797 h.p. and a total construction cost of $50,740,458 show an average cost of $69.11 per installed turbine horsepower. The figure in brief represents the average capital cost of construction at the power site and is of considerable interest to engineers.

Hydro-Electric Power in the Central Station Industry.—One of the most important facts disclosed as a result of the statistics is the outsanding position which water power takes in the central station field. Out of a total installed primary capacity of 1,844,571 h.p., 1,652,661, h.p., or 89.6 per cent—practically 90 per cent—is derived from water. This figure is indicative of the extent and availability of the water power resources of the Dominion and of the remarkable degree to which their adaptability for central electric station work has been appreciated in principle and realized in practice. The vast water power resources of the Dominion, the ready adaptability of hydro-power to the production of electrical energy and the increasing extent and scope of economical electrical transmission form an industrial asset which probably more than any other will ensure a full measure of future prosperity.

The Yukon develops 97.4 per cent of its primary central energy from water. Ontario develops 95.7 per cent from water indicating markedly the commercial adaptability of water power for central station work, even where in competition with convenient and reasonably cheap coal supplies. Manitoba develops 95.2 per cent of its central station energy from water, Quebec 94.9 and British Columbia 89.9 per cent. Alberta develops 43.2 per cent from water, although an abundant supply of coal is available. New Brunswick develops 38.8 per cent from water power, Nova Scotia 19.2 per cent. The percentage of water power used in central electric stations in Nova Scotia is low although the province is exceptionally endowed with available water power resources. An abundant coal supply indicates the reason for this condition. The city of Calgary is served from a steam-driven plant, the largest central electric station in the Province. The present tendency in the province is, however, towards the increased use of hydro power. In Prince Edward Island only 13.9 per cent of the central station power is derived from water. Topography and area of the Island province explains the lack of water power resources. In Saskatchewan no water power is developed. Here the topography of the province is solely responsible, the entire settled portion being located in prairie country which is not naturally endowed with attractive water power sites.

Tables 1, 2 and 3 provide a more detailed analysis of the statistical data referred to in the foregoing.

Directory of Central Stations.—The directory of central electric stations in Canada, whilch forms Part II. of the Report constitutes a ready reference to the central electric stations of the Dominion. Garvke's Annual issued in England and McGraw's Directory published in the United States have attempted to deal with this field in Canada, in order to provide reference data in the general interests of commerce and industry. The material which has now been compiled is much more exhaustive and comprehensive in every way than either of these publications, and it is thought that it will prove a valuable asset in the reconstruction period as it permits a bird's eye view of the present status of the industry in all parts of the Dominion and indicates the locations where expansion is readily feasible. As already stated, a special effort has been made to secure from the various corporations and municipalities, information relative to blocks of electric power available for sale; the prices at which such power can be provided; the available sites for industry in the vicinity, and the transportation facilities available. The corporations and municipalities have co-operated heartily in this connection. It is intended that, in so far as possible, this information shall be kept up to date, in the Dominion Water Power Branch.

For Part I (statistical) application should be made to the Dominion Bureau of Statistics, while for the Directory, Part II., distribution will be made by the Dominion Water Power Branch.

Time Clocks in Schools

Proposal that School Pupils and Students Register Their Time, Arouses Wide-Spread Attention —Employers are also Keenly Interested in the Movement.

Educators all over the country are discussing the proposal of Principal F. P. Gavin, of the Windsor, Ont., Collegiate Institute, that students be required to register IN and register OUT on time recorders, just as they will later do in the business world.

Principal F. P. Garvin is to be highly complimented on this advanced idea, showing that he realized that the future business people of the country cannot be taught the value of time and the value of punctuality too early in life.

People prominent in various walks of life have gone on record to the effect that Principal Gavin's idea marks a new era in school life. What greater lesson, they ask, can a child or young person be taught, than the value of time and punctuality, and at the same time be taught one of the greatest essentials to success in business? While School Boards in some sections are already using Time Recorders in connection with the Teachers, Principal Gavin's proposal quite indicates that he is of the opinion that its disciplinary benefits should go further and include the pupils also.

Incentive Supplied Students.

In addition to affording both teachers and parents an indisputable record of the time that each pupil arrives at the class room, or leaves the class room, it is pointed out that a direct incentive is supplied the student, for the reason that the method would eliminate the bad habits of arriving late or leaving early on some trivial and often doubtful excuse, frequently offered under the supposed parental authority. This, teachers argue, would be a great benefit in carrying out the class schedules, and improving the morale of the class.

Moreover, the valuable study time lost by each pupil must, when one considers the hundreds of thousands of pupils, amount to many hundreds of thousands of hours monthly. Moreover, such lost time must set a bad example to all pupils as is evidenced by the present indifference on the part of many pupils to this question of punctuality. These two factors are said to be the greatest evils in the present educational system, and is one of the reasons why the teachers have been found to be genuinely interested in the new movement, to record all the comings and goings of their pupils.

Eliminated Favoritism.

Teachers are recognized as being very human people. In fact, it is necessary that they be so, and this fact in itself makes it difficult indeed for a teacher to eliminate what might be called favoritism. Parents see in the new idea a method that will remedy this element. The time recorder of course is totally impartial, and since each pupil would register his or her record, it follows that the personal element cannot enter into it. This must be important in the childrens' minds, for they would quickly recognize that each and all were treated exactly alike, which is recognized as the one method to command the greatest respect.

Parents would unquestionably place high value on the time card record that the pupil could bring home at the end of each week or month. They would know immediately whether their children were loitering on the way to school or on their way home, and further, know almost to the minute how long a child had been kept in at school, all of which is valuable information.

Employers Keenly Interested.

In view of the far-reaching effects in later life this proposition is likely to have, business men and particularly manufacturers, are watching the progress of the new movement with undisguised pleasure. They see in it the best remedy for the old commercial and industrial evil, the "late" habit of new employees recently out of school.

It is a well-known fact to all employers that this tardiness with its direct loss to the firm, is mainly due to the fact that all through school life the pupils or students were not educated along the lines of making a printed record of their comings and goings. Manufacturers feel that the time recorder should have its place in school life, it is the training ground for business, since it has been found indispensible in the later. The general concensus of opinion of the business men interviewed on the subject is unquestionably in favor of the installation of time recording machines, in every school and educational institution in the country. They point out that many young men or women have lost an opportunity of promotion by their executives owing to the fact that they had not exhibited the proper appreciation of the value of time or the value of punctuality.

Major R. W. Coulthard, who recently returned from France, is now in Toronto, where he recently took charge of the Davisville limb factory of the Department of Solviers Civil Re-establishment.

Mr. O. A. Dunlap has been elected vice-president of Hollinger Consolidated Mines, succeeding the late John McMartin.

Want Bounty on Iron

Mining men and citizens generally of the Canadian West propose once more to bombard the Dominion Government in the effort to secure the passage of legislation placing a bounty of 50 cents a ton on the production of pig iron in Canada. Some action of a similar character was urged by a strong delegation from British Columbia at the Canadian Capital last year with no more effect than the elicitation of a promise that the Federal Government would purchase all pig iron produced for which no other market was available at "the market price." This had no effect on the industry, and none was looked for by the disappointed delegates. Apart from other considerations the phrase "the market price" was too indefinite. Did it mean "the market price" in the West or the East of Canada. If the latter, then there was no advantage, and further representations failed to secure any clearer explanation of what was meant. Now mining men of northern Ontario are joining with the Pacific Province in the movement, as is evinced by the following telegram received by Hon. Wm. Sloan, Minister of Mines for British Columbia:

Port Arthur, Ont.,
January 2t8h, 1919.

Wm. Sloan,
Minister of Mines,
Victoria, B.C.

Delegation meets at Ottawa February 3rd on iron bounty and increased production of iron and steel in Canada. We urge you to attend. If impossible, send representative or wire your endorsation of movement to your own member or to F. H. Keefer, M.P., Ottawa.

E. J. BLAQUIR,
MAYOR A. W. ROBERTS,
President Board of Trade.

The whole-hearted co-operation which Port Arthur may look for from British Columbia in regard to this matter is indicated by Hon. Mr. Sloan's reply, which follows:—

January 29th, 1919.

E. J. Blauquier,
Mayor A. W. Roberts,
Board of Trade,
Port Arthur, Ont.

Re your wire and importance of Dominion Government adopting such policy as will encourage development of Western Canada Mineral Resources and production of Iron and Steel, wish to state that representations of this character have my hearty sympathy, and that I sincerely trust your efforts will meet with success. Regret am unable, owing to opening of Provincial Legislature to-day, to join your delegation in person. However, have taken this matter up with Dr. S. F. Tolmie, M.P., and Charles A. McIntosh, M.P., who assure me that there is no doubt the British Columbia representation at Ottawa is a unit on this question, and will as a body press the claims of the West during the forthcoming session of Parliament. In this connection may say that it is my present intention, as soon as local sessional duties permit, to visit Ottawa to add my support to the end that the Federal Government take steps to encourage this important industry. We feel that our Government, in offering bounty of $3 a ton on pig iron produced in

the Province from local ores, has gone as far as our financial resources permit, and the Dominion Administration should give practical evidence of its interest in the development of the immense iron deposits of the West which now are dormant. We are on the threshold of a period of reconstruction and it is of the utmost importanct to the indusrial and commercial fuure of our country that this vital basic industry should be established.

WM. SLOAN,
Minister of Mines.

OBITUARY.

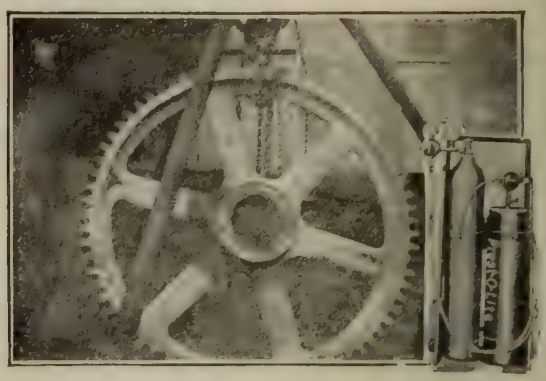
James Cumming.

One of the pioneer mining men of the Canadian West died at Vancouver, B.C., on December 3rd last, in the person of James Cumming. He was known to all old timers, having figured prominently in the events connected with the rush to the Cariboo gold fields, where he went in 1862 and where he worked for eight years, having been identified with the development of the famous Cameron claim. Until a few years ago he lived in the same district, operating various placer claims with indifferent success, but always cheerful and buoyed up with the never-failing confidence that some day he would make the "big strike." In 1912 Sir Richard McBride presented him with a Free Miner's License as a public and personal testimonial.

Will Abolish "Closed Towns."

Legislation is proposed by the Hon. T. D. Pattullo, Minister of Lands for the Province of British Columbia, which will affect the policy of the Granby Consolidated Mining & Smelting Co., Ltd., as well as other mining and manufacturing companies, of maintaining what are termed "closed towns" in those areas near their plants where homes are provided for officials and employees. The companies' explanation for their course in this report is that it is in the interest of their respective businesses that agitators and idlers, and people generally with no particular business, shall be kept out of such centres. On the other hand the Minister of Lands takes the position that the right of any private corporation to arbitrarily prohibit intercourse between the members of their particular community with the outside world is questionable, that it results in the restrain of free competitive trade, and is an unjustifiable interference with the freedom of the subject. It is not proposed by the Government, however, to place any law on the statutes which will force the companies to throw open their towns to the same extent as are the usual run of municipal corporations. The Lieutenant-Governor-in-Council will be given power to declare certain communities company towns, within the limits of which the public shall have free right of ingress and egress over the ways and roads used by the companies as avenues of traffic; but it is not intended that the ways immediately adjacent to the works themselves and used solely in connection with actual industrial operations shall be deemed avenues of traffic. In other words the prohibition will be lifted as regards avenues of traffic which are in the townsite proper and on which are located the various public offices, public buildings, etc. Provision also will be made for wharf accommodation for public traffic and use in cases of those towns where water transportation is the only means of approach.

Oxy-Acetylene Welding and Cutting



This Expensive Gear Wheel Reclaimed at Trifling Cost

This Gear Wheel, in a large plant at St. Catharines, was broken recently. To replace, it would have taken much valuable time and represented quite a serious expense.

A local Prest-O-Lite operator was called in and undertook to repair the casting in record time at trifling cost.

The work was done by the job welding department of the International Garage, St. Catharines, Ont., and has given complete satisfaction.

Prest-O-Lite Oxy-Acetylene Welding is proving a great economic factor in the Factories, Mills, Railroads, Mines and Machine Shops of Canada.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Address Department C-108.

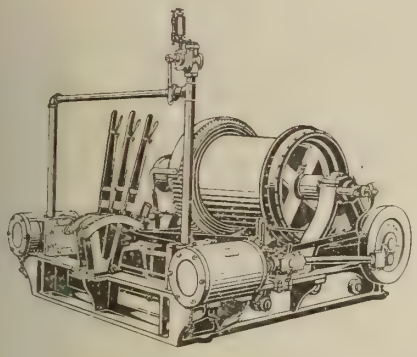
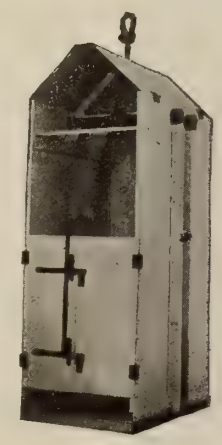
MINE HOISTS AND CAGES



With our Hoists and Cages your men are at all times perfectly safe.

The Hoists are made to your order exactly the way you want them made.

The cages are also made to order to fit your shaft, and are provided with a proper Safety Device so the cage cannot fall to the bottom of the shaft if the cable breaks.



We make these Mine Hoists reversible or non-reversible, and with Friction Drum, as shown, or with Drum Keyed fast to the shaft. We also make them for either Steam, Electric, or Belt Driver, and in 7 sizes, from 10 to 50 H.P., and with any required size of Drum up to 48''.

Marsh Engineering Works Limited, Belleville, Ontario

ESTABLISHED 1846

Sales Agents: MUSSENS LIMITED, Montreal, Winnipeg and Van ouver

Northwest Kootenay Mining Association.

The mining companies of the Golden and Windermere districts of British Columbia are organizing the Northwest Kootenay Mining Association, the object of which will be to encourage mining in that section and to assist in any way that may suggest itself in the advancement of the industry.

CUT GEARS

All Types - Any Size
Large Capacity

Hamilton Gear & Machine Co.
Van Horne St. - TORONTO

FOR SALE—TWO CLAIMS

Adjoining Hattie Gold Mines in Coulson, Beatty Area
Would give Working Option to responsible parties

H. C. CROW, 184 Sunnyside Ave., TORONTO

BURNS & ROBERTS

MANUFACTURERS OF STEEL PLATE WORK
Tanks, Air Receivers, Penstocks, Etc.
Dealers in Railway and Power Plant Machinery
BANK OF HAMILTON BDG., TORONTO LIMITED

FOR SALE

1 4x8 Marathon Mill, with 7 tons of grinding rods from 5/8 to 1¼ in. diameter, and 7 tons extra 1¼ in. rods. The delivery of this mill was too late for the purpose for which it was bought, so it has not been used.

1 12-in. x 15-in. two-drum Jenckes Tandem Hoist, with one 20-in. auxiliary drum and one nigger-head mounted on the shaft extension. Second-hand, but in good condition.

1 Steel Mast, 11 x 17 inches, 45 or 60 feet long, equipped with all sheaves, foot castings and swivel top piece for 12 guy wires.

1 1 cu. yard Mansfield back dump Excavator Bucket, second hand.

McKinley-Darragh-Savage Mines Limited

COBALT, :: ONTARIO

ELECTRIC DAYLIGHT

DID YOU EVER WISH FOR DAYLIGHT AT NIGHT?

Those new buildings that have to be rushed to prepare for extensions—the new equipment to meet that increased tonnage — the emergency that means night work at the shaft opening — the loading of supplies and timber for underground at night; these are but a few cases where

SAFETY
for the
NIGHT GANG

Northern Electric
DAVIS
FLOOD LAMPS

will produce big returns in time and money saving for a comparatively small investment. The light can be diffused over large areas or projected in a solid beam—there are no carbons to trim—and the lamp is perfectly portable — no permanent wiring necessary.

Write for descriptive folder "Electric Daylight," giving prices and full information. Tell us your night-lighting problems.

:-: EDITORIAL :-:

AN OPPORTUNITY FOR THE CANADIAN MINING INSTITUTE TO SERVE THE INDUSTRY.

Great interest is taken in the election for president of the Canadian Mining Institute this year, owing to the feeling that it is desirable that the Institute should play a more important role in the mining industry. In the opinion of many members, an Institute that would exclude others than engineers would be of comparatively little use to the industry. It is true that it would be much better to have such a society than none, and that much good results from purely technical discussion among engineers. It is true also that there would be some advantage to engineers in membership in an exclusively engineering society. Our contention is that the Canadian Mining Institute has a bigger field for usefulness. It has an important place to fill as representative of the mining and metallurgical industries. It should further the interests of its members, not by seeking special privileges for them, but by speeding up the development of our mineral resources, and by guiding development along lines that are in the national interest.

If the Mining Institute is to represent the industry, the members must see to it that the officers of the Institute are active in educating public opinion in regard to mines and mining. There is little use in complaining of the lack of consideration which Governments give the industry, so long as no great effort is made to inform the people who elect the members of parliament. Governments can afford to ignore the mining industry only so long as there is no general appreciation of the advantages that the country reaps from the activity of mining and metallurgical companies. If the Canadian Mining Institute will perform its natural function as the mouthpiece of the industry, the public will be so well informed that Governments that do not feel disposed to take a leading part in the development of our natural resources, will find it advisable to consider whether mining is not an essential industry in this country.

Mining is, next to agriculture, our greatest basic industry; but the people do not yet realize it, and consequently those who represent the people have given the industry little consideration. Few members of parliament show any indication of having more than a child's knowledge of mines, minerals, and metallurgical works, and their importance to Canadians.

Who is to blame for this condition of affairs? If this country were run on the German plan, we might justly lay the whole blame on the governments. We are not sure that Canada is entirely free from Kaiserism; but so far as leadership in developing mineral resources of Canada is concerned, our Federal Governments can well plead not guilty. If we accept the idea that our system of government is a purely democratic one, our Federal Government has good reason for ignoring the mining industry. If the electors do not press for more activity on the part of the Government in developing our mineral resources, the inaction can be expected to continue. Some organization must undertake to inform the electors. The natural organization is the Canadian Mining Institute.

We believe that the most important work for the Canadian Mining Institute during the period of reconstruction is to do what it can to speed up development. Our mineral deposits do not increase with age. Every year we leave the deposits undiscovered and undeveloped, we are denying ourselves the use of our natural walth. If the public appreciated this, would they not insist on every encouragement being given to mining? Cannot the Canadian Mining Institute do much towards improving the status of mining in Canada, by functioning as the voice of the industry?

What the Mining Institute does during the coming year towards increasing the faith of Canadians in our natural resources and in obtaining greater aid from governments for the mining industry, depends largely on whom the members elect as president. Members at Porcupine and Toronto have nominated Mr. J. B. Tyrrell for this office, because they feel confident that he will devote much of his time to the affairs of the Institute, and because he is an advocate of greater publicity for mining, recognizing as he does that one of the most important duties of the Canadian Mining Institute is to inform the electors and the governments on matters of importance to the mining industry. Moreover, Mr. Tyrrell's work takes him to all parts of Canada, and if he is elected we may expect him to take an interest in mining and metallurgical work in every district.

Those who are supporting Mr. D. H. McDougall for the presidency say:

"Mr. McDougall, a native of Nova Scotia, is President of The Nova Scotia Steel and Coal Co., and has

been actively engaged in the coal, iron and steel industries throughout his professional career. Mr. McDougall has already rendered exceptionally valuable service to the Institute. As President of the Mining Society of Nova Scotia he aided essentially in effecting the amalgamation of this Society with The Canadian Mining Institute during the past year. This is a step which has long been desired, and which materially strengthens the position of the Institute as a national society. Moreover, during the last year, Mr. McDougall took a very active interest and did a large share of the work in the organization of the Iron and Steel Section of The Institute. It is our confident belief that Mr. McDougall's election as President this year is especially desirable not only on general grounds, but also in order to bring both of these measures, to which he has already so largely contributed, into full working effect."

Mr. McDougall is admirably fitted for the office of President of the Canadian Mining Institute. We have no doubt that, he would be able to do much along the lines indicated by those who have endorsed him for election this year. We hope that he will fill the office at some time in the near future: but for the most important work which the Institute could do this year, Mr. Tyrrell appeals to us as the logical president. Mr. Tyrrell is one of those who believe that the Institute should endeavor to be of greater service to the industry, by taking a more active interest in all matters affecting the industry. We know that he can and will give the necessary time and attention to such work. The Institute needs such a president. We admire Mr. McDougall, but we hope that Mr. Tyrrell will be elected.

PROTECTION OF INVESTORS.

It is almost certain that this year is to be marked by great increase in activity in mining and exploration in Canada, particularly in the gold producing areas. Gold mining was unattractive during the period of high prices, but much progress was made by the companies that were able to continue operations. There is every reason to be optimistic for the future. We may expect that many investors will be attracted by the promise of wealth to be gained, and we expect that development of our mineral resources will justify large expenditure. We hope that a larger number of Canadians will take part in this development and share in the profits.

We would warn those who are inexperienced in mining, however, that the development of mineral resources is in the early stages a very uncertain business. In the case of mines that have been well developed and have been producing for some time, there are good grounds for predicting the results of operations for some years ahead. In the case of new properties on which little work has been done, those who provide funds for development take long chances. They should see to it that they have an opportunity to make correspondingly large profits in case the venture proves a successful one. Those who invest in mining securities should realize that while there are many profitable mines, there are comparatively few like Creighton, Hollinger and Nipissing. The chance of any prospect developing into such mines as these is very, very small. Those who are most familiar with the mining industry consider such properties to be as good security as any industrial enterprise, and better than most. They also consider, however, that such prizes are rare, and that while others such as these will be developed it will only be after many unprofitable properties have been tested.

Development of new properties usually necessitates considerable expenditure before any return is possible. Those who subscribe money to pay the cost of development should see to it that their money is used for development, and that if the venture is successful they obtain profits comparable with the risk they take. Governments can provide some protection for investors by insisting on full publicity of company affairs, so that the investor may be able to judge, whether his money has to earn an unreasonable amount for others before it will be possible to return large profits to the subscribers. But it is scarcely possible for Governments to make such inquiry into every company's affairs as to remove all risks for the investor. The experienced investor finds it advisable to consult reports of expert examinations of properties and to satisfy himself as to the character of the promoters. There are risks enough in developing new properties when the money invested is used in well advised development work.

It is particularly desirable at this time that development be speeded up and that Canadians take a larger part in the development. We hope that those who wish to obtain the co-operation of the public will see to it that the public is given a fair show. Investment in most mining enterprises is properly classed as speculative and investment in undeveloped properties is very speculative. Those who cannot afford to risk losing their money should not be invited to take part in such enterprises. On the other hand those who are able to risk something in the hope of making large profits should be encouraged to do so. They should be given all the known facts and not asked to believe that they are investing in enterprises that are sure to be successful. Unduly optimistic statements may attract some investors, but such men are not likely to put their money into a second enterprise of the same sort. If we would foster Canadian investments in mining enterprises, we must see to it that everything possible is done to in

form the public of the risks as well as of the possible gains. There are many who would be willing to risk their money if they were confident that they were given reliable information by promoters. Those who launch new companies would do well to bear in mind that they scare away experienced investors when they describe prospects as mines and when they endeavor to hide vital matters by glowing phrases. There will be more publicly subscribed money for mining when there is more plain talking by promoters.

It is customary to suggest as a remedy for all evils, that the Government do something. In this connection many will claim that the Government should be asked to make a searching inquiry into every new mining and exploration company, and have experts report on the actual value of the shares offered for sale. We believe that the Government might do good by insisting on more explicit statements by promoters; but we do not believe that Governments should be asked, or that they could if they tried, at reasonable expense, obtain all the desired information. It is in the search for information that much money must be spent in exploration and development. Those who find, by an expenditure of money and labor, that a prospect gives promise of becoming a profitable mine, are the ones who should be rewarded for the risks they have taken. Governments cannot give such information. They can, however, help to obtain the desired information and they can well be asked to do more work of the character they are now doing. They can help the prospector by geological maps and reports, by transportation facilities, and by suitable mining laws and regulations, and they can help protect investors by taking a more active interest in the flotation of new companies, and in new offerings by old ones.

A MISLEADING PROSPECTUS.

There has lately been on exhibition in shop windows in Yonge street, Toronto, specimens of silver ore and rocks from the Cobalt district, which serve to draw attention to a company that is soliciting subscriptions to develop a prospect known as the O'Connor property, Coleman township. Concerning this property the salesman interviewed by the writer made some strange statements. We were also presented with a copy of a prospectus, dated December 17th, 1918, and "filed in the Office of the Provincial Secretary of Ontario."

According to this prospectus the property "is located in a rich, proven mining district." An 'engineer' says of the ore deposit that "the vein filling is calcite, cobalt, nickelite, and smaltite." * * * * * "at 6 ft. depth, the vein jumps" * * * * * "the vein is well defined and is one of the strongest fissure veins in the Cobalt Camp."

Now the property is not in the Cobalt Camp and the vein would have to make many 'jumps' to get there. Those who read the prospectus may, however, be satisfied with the statement that the 'engineer' who reports on the property has been informed "on good authority" that another person "took a general sample of the ore from a 58 ft. level and got 520 oz. silver." The 'engineer' fails to state how much ore was taken, but we imagine that the sample weighed at least one ton. It would be of interest to learn how the sample was taken and what its significance is.

We do not doubt that silver has been found on the property and that as a prospect it is worth some attention; but what we learn of the ore deposit from the prospectus it does not impress us very favorably.

Even worse than the description of the ore deposit is the information, or lack of information, concerning what the purchaser of shares gets for his money.

OUR PLATINUM AND PALLADIUM PRODUCTION.

In an article published in the "Toronto World" on Thursday, February 6, Mr. J. F. Black, of Sudbury, calls attention to the production of precious metals. He quite properly emphasizes the fact that proper record is not kept of the precious metals contained in the ores mined in the Sudbury district. The statements published abroad concerning our output of platinum and palladium are very inaccurate, doubtless because of our own failure to publish accurate statistics.

In a graphic representation of the metals output of the British Empire, published recently by a supposedly good authority in England, Canada's output of palladium and platinum is given as a few ounces per year. Actually the annual production is valued at several million dollars.

Very large quantities of these precious metals are mined with the nickel and copper of the Sudbury district. Our Government records do not show what the amount is. Are Canadians so uninterested in their own natural resources that they will not undertake the task of keeping a proper record of production? It would cost something to obtain the exact figures by sampling every shipment, but with the co-operation of the producers a close approximation could be made without great difficulty. From what we can learn, a good deal of the precious metals is lost in the process of treating the matte. As most of the refining is done in the United States and Wales, we have no record of the recovery. Canadians should be advised, however, concerning the amount of precious metals contained in the mine, smelter, and refinery products exported.

Reports of British Columbia Government Mining Engineers

A feature of the Preliminary Review and Estimate of the Mineral Production of British Columbia for 1918, which has just been issued by the department presided over by the Hon. Wm. Sloan, Minister of Mines, are the summaries by the six mining engineers, appointed to the same number of Provincial districts to report upon and to encourage mining development therein, of the work coming within their respective jurisdictions during the past year.

Mr. G. H. Clothier, of the Northwestern District, draws attention to the increase in the production of copper and gold in that section of the Province. He points out that the exceptional showing in respect of the former metal is due to the Granby Consolidated Mining & Smelting Co's operations, while the good showing as to gold lies to the credit of the Belmont-Surf Inlet Mines, the production of which, it may be said parenthetically, is one of the notable occurrences of the year 1918 in this Province from the standpoint of the mining industry. It is pointed out, however, that the placer fields of his district have not yielded as before because of the oft-quoted fact that the value of gold stands still while the cost of everything connected with its production has been soaring.

The output of the Northeastern District is placed at about $375,000 in value by Mr. J. D. Galloway, Government Mining Engineer. Nothing of special interest is noted by Mr. R. W. Thomson, of the Central Mineral Survey District, although he furnishes particulars of the development of various mining properties which indicate that mining is far from stagnant in that section. Mr. P. B. Freeland, of the Southern Mineral Survey District, states that some 705,000 tons of mixed ore were produced within that district during 1918 and that "considerable activity was shown during the greater part of the year in prospecting for minerals necessary for war purposes." Of this work and its results he promises more details in the annual report. The various mining enterprises of the Kootenays are dealt with in some detail by Mr. A. G. Langley, of the Eastern Mineral Survey District, while Mr. Wm. M. Brewer, of the Western District, which includes Vancouver Island and a part of the lower British Columbia Mainland, observes that, while there has been no phenomenal progress in either coal or metalliferous mining in his district, the advance has been steady.

In introducing his report Mr. Clothier says:

"The output of the district for the year will approximate 837,200 tons, producing 30,908,300 lb. of copper, $980,000 in gold, and $282,000 in silver. This is a considerable increase over last year, due to the greater production of the Granby Consolidated of copper, while the increase in gold and silver is accounted for by the very successful year of the Belmont-Surf Inlet Mines, Limited. The output of placer gold will, however, be considerably less than last year.

"The outlook of this district for the coming year is exceptionally good, for it is almost a certainty that the railroad of the Dolly Varden will be adjusted and it will become an important producer. There is every prospect of several smaller properties in that section also shipping during the coming summer. The Portland Canal section will have a shipper in the "Bush" property this winter, with several other properties showing up well with development. These sections will greatly increase the gold-silver production of this district. The Engineer mines, at Atlin, may also be expected to become a big gold-producer, possibly within the next year.

"With the war over and the return of many of the men who enlisted from this north country, together with others who will be well fitted for the life and alive to the many opportunities of this particular portion of the Province, I look for an extensive revival of prospecting and mining activities."

Under Queen Charlotte Mining Division, he says:

"Some little local excitement was caused at a logging camp on Shuttle island, about six miles south of Lockeport, when the cook discovered gold in the gravel on the beach, and later in small quartz stringers running through the slaty country-rock. No work to amount to anything had been done on the quartz stringers at the time of my visit, but I am informed that the owner is now sinking a shaft on the most likely looking portion. The placer claims on the beach have been purchased from the original stakers and will be worked this winter. The beach gold is, without doubt, the result of the disintegration of the quartz gold-bearing stringers whose gold has been concentrated in the gravel."

Belmont-Surf Inlet and Drum Lummon Copper.

Interesting observations with reference to the Belmont-Surf Inlet Mines, Ltd., the Drum Lummon Copper Mines, Ltd., and the operations of the Granby Consolidated on the Ecstall River are found under "Skeena River Mining Division" as follows:

"The Belmont-Surf Inlet Mines, Limited, operating at Surf Inlet, on Princess Royal island, has been under continuous operation and had a very successful year. The output was 8,209 tons of concentrates, shipped to Tacoma, and yielding 43,328 oz. gold, 27,990 oz. silver, and 451,820 lb. copper, a very satisfactory showing for the first year's operation. Extensive development-work is being carried on continuously, with such successful results that the ore reserves have been largely increased. An ice-breaker has been put on the lake for the winter months, so that there will be no interruption of shipments.

"The Drum Lummon Copper Mines, Limited, has been operating its property on Douglas channel all summer. The main work underground has been the continuation of the drive on the ore-zone, which has now been opened up for a distance of over 200 feet. Considerable ore was broken down on to the drift-level before closing down the underground work for the season. This will give ample material for the mill to experiment with from now until spring. A new compressor, run by a 25-horse-power gas-engine, was installed early in the year and proved ample for all requirements. A small milling plant was erected and had been in operation only one day at the time of my examination. It is equipped with a small jaw-crusher at the head which takes the mine-run of

ore, crushing to about 1 inch size and discharging into storage-bin. Two Gibson type mills, each of 18 tons per 24 hours capacity, are fed from this bin and grind to discharge through a 40-mesh screen, feeding directly to a concentrating-table designed by the manufacturers of the Gibson mill. The whole is run by a 10-horse-power gas-engine. This plant has demonstrated that it will make a concentrate of 62.5 per cent copper, 1.12 oz. gold, 30 oz. silver, running on a feed of 5.9 per cent copper ore. The loss, however, will be very heavy unless some scheme, such as a flotation-cell, is used to treat the slimes and middling product. It is a very creditable little plant and will no doubt be gradually improved and enlarged.

"The claims up the Ecstall river, mentioned in last year's report, have been further explored by diamond-drilling by the Granby Consolidated, who have the property under option. No information is available from the company as to the results obtained. The work was closed for the winter, but will be resumed in the spring. The importance of the success of this property to this part of the Coast cannot be overestimated."

Concentrating Granby's Hidden Creek Ores by Flotation.

Coming to the Nass River Mining Division Mr. Clothier discusses the work of the Granby Consolidated as follows:

"The Granby Consolidated Mining, Smelting, and Power Company, Limited, has exceeded its last year's output of copper, smelted from its own British Columbia ores, by nearly 3,000,000 lb. The amount of ore smelted from its Hidden Creek mines was 828,488 tons, exclusive of limestone and quartz used for fluxing purposes, producing 30,394,109 lb. copper and approximately $107,000 in gold and $282,000 in silver.

"The 100-ton 'pilot mill' has been operating steadily all year in experimental work on the concentration of the Hidden Creek ores, as well as ores from the company's Alaska properties. The milling process is confined to flotation alone, and some very satisfactory results have been obtained on the siliceous ores. Good progress has also been made in experiments on the selective flotation of the heavy sulphide ores.

"The company has under way an immense project in the installation of coke-ovens, with all the attendant modern equipment for saving and utilizing the by-products. The plant will cost approximately $2,000,000, and it is expected it will be in operation early in the spring. The coal-supply for this plant will be obtained from the company's coal property on Vancouver island. The most important prospecting-work the company has undertaken during the year is the exploration of the Ecstall River pyrite-showings. I understand that results from work to date have been sufficiently encouraging to justify further investigation in the spring."

Among other notable prospects dealt with in the Alice Arm Section an interesting reference, as appended, is made to the Standard Group:

"The Standard group of four claims is situated on the south side of McGrath mountain. It is owned by W. McLean and others, of Alice Arm. The showing on the property is an immense vein of quartz, 60 feet wide where exposed by an open-cut along the side-hill, mineralized with zinc-blende disseminated through the quartz in bunches and in bands up to 2 feet in thickness; in fact, it would be hard to break off a piece of quartz that did not show zinc in the whole 60 feet. Further strippings and open-cuts down the hill expose the same class of ore, but whether it is the same vein or a parallel one is hard to decide from the amount of work done. It is a remarkable showing of zinc sulphide, about four miles from the beach, and ideally located for economical tunnel-mining. The ore, being a straight zinc sulphide and quartz, is a perfect one for concentration."

The country adjacent to the Kitsault River is found very promising. Mr. Clothier says:

"This section was in a fair way to become an important factor in the mining industry of the Province this winter or early next year. The railroad from the beach to the Dolly Varden, partially constructed last year, was practically rebuilt and nearing completion when the contracting company went into liquidation, with the result that the camp of Alice arm and the section tributary to it are tied up for the winter. It is to be hoped that an early adjustment of railroad affairs will be arranged, so that this may have the opportunity of becoming one of the most important mining sections of the Province.

"The Dolly Varden Mines Company owns the Dolly Varden property, about eighteen miles from tide-water on the west bank of the Kitsault river, and the Wolf property, two miles farther up on the east bank of the Kitsault. The Dolly Varden has been extensively opened up by underground development, as described in the Minister of Mines' Report of 1916, and is therefore in condition to start shipping at any time. The ore-bodies have been proven by thousands of feet of diamond-drilling. On the Wolf a tunnel 35 feet long has been driven in on the ore-body, from the face of which a crosscut to the north 50 feet and to the south 10 feet proves the ore-body for a width of 60 feet, with neither wall in sight. Several thousand feet of diamond-drilling has been done, proving the extent of the ore-body and showing it to be of a good milling grade."

High Grade on Big Missouri.

Of the Big Missouri in the Salmon River District, of which considerable has been heard of late, the Resident Engineer states:

"The Big Missouri group, a well-known property belonging to Lindeborg Bros., of Stewart, has undergone during the past season a complete change. Heretofore it has been considered from the standpoint of a big, low-grade-complex-ore proposition, with many difficulties in sight and requiring large capital. Work done during the past season, however, on the two claims adjoining the Mineral Hill group has proven that the same high-grade ore-shoots extend on to the Missouri ground. Fifteen open-cuts were dug all over these claims, with results which were highly satisfactory. Since then the bond has been transferred to D. D. Mann and associates, who, I understand, are planning extensive exploration-work for the coming spring."

The Engineer Mine.

The Atlin Mining Division and the Engineer Mine are next dealt with and, in view of the possibilities of the latter property, one of the most promising of the lode mines of Northern British Columbia, references to it are given in full:

This portion of the Province has been comparatively quiet for the past two years on account of the scarcity of labor and the extreme high cost of everything pertaining to mining. There has been little or no prospecting for mineral and, with the exception of two properties, no development-work. In the placer

areas there is no new ground being opened up, and where working on "pay" the lack of labor is a serious handicap.

I expect to see many of the returned soldiers take to this north country, for the life is suitable and the chances for a "stake" are good. I have no returns yet of the placer yield for the year, but I judge it will be less than last year.

The Engineer mine has been developed to the point where it justifies being exploited on an extensive scale and put in the big producer class. This will naturally stimulate lode-mining in all parts of the section.

The Engineer mine property consists of eleven Crown-granted claims situated on the southern end of Taku arm. It was owned by the late Captain James Alexander.

During the past ten years there has been a great deal of work done by way of surface-stripping, open-cutting, shaft-sinking, mining from the surface, and underground development. This work has exposed on the surface two series of veins, each radiating from a central quartz-mass or "hub," the majority of the veins in each series showing visible gold, and the hubs reported to be of milling grade ore. A 2-stamp mill was operated for several years with ore mined from high-grade surface showings and packed to it on men's backs. The record run for this mill was two hours and a half, producing 24 lb. of gold.

All the underground work, with the exception of the new crosscut tunnels now under way, has been done on the "E" vein, from which a considerable tonnage was mined from the surface. A shaft has been sunk 250 feet, from which four levels have been run on the vein. The first level is from the surface, cutting the shaft at 50 feet below the collar, and extending a further distance of 345 feet on the vein. No. 2 level, 45 feet below No. 1, has been driven 100 feet north and 190 feet south of the shaft; No. 3 level, 50 feet below No. 2, has a drift 210 feet south of the shaft; and No. 4 level, 90 feet below No. 3, has been run 145 feet north and 90 feet south. The shaft is 40 feet below the No. 4 level and shows the vein to be 2 feet wide, with visible gold on each wall. There is a bonanza shoot of ore or from 1 to 6 inches thick, widening in one place to 18 inches, showing on the second, third, and fourth levels for a length of 40 feet. The remainder of the vein, on all the levels, would be considered high-grade ore. In development-work the waste is broken ahead of the ore about 19 feet; the ore is afterwards broken down and taken to the sorting-tables on the surface, where it is broken up and sorted into three grades of ore — that showing visible gold, a second grade which is sacked for shipment, and a third grade sent to the dump for future treatment. The grade showing gold is accumulated until sufficient to run through the ball-mill, 600 to 1,000 lb. being the usual charge, in which it is pulverized in about two hours; mercury is then added and amalgamation completed in from twenty to thirty minutes. The tailings are sacked and shipped with the crude second-grade ore, which averages from $150 to $200 a ton. The record run of the ball-mill was 24 lb. 8 oz. of gold from 160 lb. of ore.

A very comprehensive scheme of development has been started. Two crosscut tunnels are being driven —the Mill tunnel from the mill-site on the beach to a point under the shaft on "E" vein, a distance of 1,200 feet, crosscutting in that distance at least five veins from which high-grade ore has been taken on the surface. This tunnel will deliver all ore from "E" vein and intermediate veins to the mill and give a depth of 500 feet at the shaft. It has been driven 309 feet. The other tunnel, called the Boulder Vein tunnel, is being driven from the level of No. 1 level in the shaft to crosscut the upper series of veins radiating from Hub B. Two of these in particular, the Boulder vein and Shaft vein, show bonanza ore on the surface. It will require between 300 and 400 feet of a tunnel to cut them; the whole series will take about 900 feet, giving a depth of 600 feet on the farthest vein. This tunnel has been driven 55 feet, and will deliver all ore from Hub B series to No. 1 shaft level, to shaft to Mill tunnel to mill. The three-compartment shaft at the head of the mill will be sunk to intercept a very rich vein cropping at the edge of the water, which can then be drifted on to Hub A, thus delivering all that ore to the shaft to be hoisted to the mill storage-bins.

The Northeastern Mineral District.

Mr. John D. Galloway has the following general observations to make with reference to the Northeastern Mineral District:

The mineral production of the North-eastern District in 1918 is expected to have been somewhat less than in 1917. The district has as yet few productive mines, although undeveloped prospects and partially developed properties are numerous. Undoubtedly many of these will repay exploitation, but during the last two years conditions have not been conducive to extensive mining development. While it is true that metal prices have been high, this has mainly stimulated actual producing mines and has not induced the development of new properties, except where quick returns were in sight. On the other hand, the scarcity, inefficiency, and high cost of labor, high cost of mining supplies, especially powder and machinery, and scarcity of capital for speculation has had a retarding effect on the development of new mining properties. It may be expected, however, that the return to normal conditions will cause greater activity in this district during 1919.

The copper-output of the district during the past three years has been largely from the Rocher Deboule mine, and this year the output from this mine has been less than in former years.

The zinc and most of the silver and lead output comes from the Silver Standard mine; this property is now in good shape to make an increased production in the future.

Considerable interest was shown in the coalfields of the Hazelton-Telkwa Sub-district during the year. The high cost of fuel-oil and the steadily increasing price of coal on the Pacific coast are conditions which have aroused interest in undeveloped coalfields. The Grand Trunk Pacific Railway during the year changed from oil-burners to coal-burning locomotives on the division from Prince George east, and it is quite possible that if a suitable local supply was available the division from Prince Rupert to Prince George would also be equipped with coal-burners.

Production of coal was started late in the fall from the Telkwa Collieries, situated four miles from Telkwa.

The production of placer gold in the district has this year been considerably less than in 1917, due to a shortage of water-supply during the season in the Cariboo Division, the main placer-producing section of the district; thus seriously handicapping hydraulicking operations.

The North-eastern Mineral Survey District contains

a large virgin field for prospecting; many areas contiguous to the Grand Trunk Pacific have been partially prospected and claims staked there, but careful examination, such as has been carried out in some of the older camps in British Columbia, has not yet been done. In addition, there is a great deal of country, both north and south of the railway, which is as yet quite unprospected, but in which the general geological conditions are favorable for the occurrence of economic minerals. It is to be expected that the return of many men to the country now that the war is ended will result in a general revival of prospecting. Undoubtedly many of the prospectors who enlisted will return to their old occupation, while the free, adventurous life of the prospector, with its promise of possible spectacular returns, will make a strong appeal to many returned soldiers who before the war had led indoor lives. The North-eastern Mineral District should secure a considerable number of these returned men who are desirous of following such a life.

During the first five months of the year 1918 the Resident Engineer was in the Victoria office engaged in preparing the report of the previous year's work and assisting in the compilation of the Annual Report of the Minister of Mines, as field-work in the district could only be commenced at the beginning of June and be continued until the end of November.

More attention was given to the Cariboo and Quesnel Divisions than in 1917, with the result—as the district is a large one—that less field-work was carried out in the Omineca Division than in the previous year. A reconnaissance in the Peace River Division was contemplated for the season, but lack of time prevented this work being effected.

The official returns for the year 1918 are not yet available, but the following estimate, it is believed, will approximate the actual production:—

Gold, placer	4,000 oz.
Gold, lode	900 "
Silver	100,000 "
Lead	155,000 lb.
Zinc	327,000 "
Copper	560,000 "
Miscellaneous minerals	$4,000
Coal	500 tons.
Total value, approximately	$375,000

Hydraulic Operations in Barkerville District.

Referring to hydraulic operations in the Barkerville district generally, and to those of some individual companies, as well as to the quartz claims of Proserpine Mountain the report says:

The hydraulic placer mines near Barkerville made a smaller production than in 1917. The water-supply during the year was not very satisfactory, so that a smaller yardage of ground was handled than in the previous year. In the early part of the season the winter snow melted with great rapidity, causing a flood of water which went to waste, and after that a long dry period occurred, during which there was an insufficiency of water for steady hydraulicking. Not much help was obtained from fall rains, so the season as a whole was unsatisfactory as regards water conditions.

Hopp Mines.—These mines, consisting of Lowhee, Stouts Gulch, and Mosquito Creek, which are operated under the management of John Hopp, were worked continuously throughout the season as the supply of water permitted. The major portion of the placer-production of the Cariboo District comes from these three properties. Stouts Gulch mine was worked up to its head in 1917, but this year the work was carried on laterally, side channels and benches being worked. There is still a considerable yardage of gravel to work out, but it may prove to be lower grade than the main channel. Lowhee mine was worked continuously throughout the season, and it is reported the average grade of gravel handled was well up to that of former years. Mosquito Creek mine was handicapped by shortage of water, and only a small yield of gold was obtained.

Lightning Creek Gold Gravels and Drainage Co.—This company carried on work at its property at Wingdam during the season with a force of about a dozen men under the superintendency of Elmer S. Will. The work done consisted of putting the surface plant of the property in shape for actual mining, which is planned for the season of 1919.

The property is an old one and equipped with a plant for deep-drifting placer-mining on a large scale. During the year the flume was rebuilt, giving more water-power, the pumping machinery was overhauled and added to, and generally the whole plant was put in good conditions.

Drilling of the ground, which has been progressing for two or three years back, was continued. The Keystone drill was operated nearly continuously throughout the season, Mr. Brown being in charge of this work.

Proserpine Mountain.—The gold-quartz claims on Proserpine mountain, which are owned by Armstrong, Tregillus, Carey, and Blair, still continue to attract considerable attention. Further development by the owners was carried on during the summer. This work was confined to surface prospecting by cuts and shallow pits. Late in the fall, however, Tregillus and partners commenced sinking a shaft, and it is expected they will continue work all winter.

There are a number of well-defined quartz veins on these claims varying in width from 1 to 30 feet. These veins are mineralized in places with pyrite, arsenopyrite, and a little galena. The main valuable metal content is gold, the distribution of which is somewhat irregular. It would seem probable that the gold primarily was associated with the sulphides, but surface oxidation and leaching have in places scattered free gold through the quartz.

From the results of many samples taken, it is evident that at least portions of the veins would pay to work, and it is quite possible that further development would show considerable tonnages of ore which would pay to mill. The ore will have to be milled on the ground, and much further development is required before a large mill would be warranted. The possibilities for these claims are that when the veins are properly opened up they will furnish sufficient tonnage to mine and mill on quite a large scale, although average values may prove to be comparatively low grade. These properties warrant a thorough investigation by any company looking for gold properties.

The Emancipation Mining Co.

One of the interesting sections of Mr. R. W. Thomson's report on the Central District is his reference to the work of the Emancipation Mining Co., Ltd., which follows:

This company has taken out three shipments during the year and is the only shipper in the district at present. Although exact figures are not to hand, the following particulars are approximately correct: Early

in the year 6 tons was treated at the Tacoma smelter and returned $6,000; later a shipment of 12 tons was treated at the Tacoma smelter which returned $1,920. The last parcel of ore sent out was a small one of about 1 ton of hand-sorted high-grade ore which was expected to net about $2,000 a ton. The tunnel, which has been driven to about 200 feet, still carries milling values in the face, but a winze has been sunk to follow the high-grade seam, which without losing its values narrowed at this point. Prospecting-work has been carried out on the Packard group, owned by this company, with very promising results. On the same lead as the Emancipation group there has been considerable excitement this year owing to the discovery of very rich free gold in the surface quartz of many of the claims. This has caused the staking of the whole lead for nearly eight miles. High-grade ore has been found on the claims owned by Toni Angelis, J. Bailey, W. Palmer, and W. McLean. Claims extend now all the way from the Emancipation group to the Emigrant Mines properties, a distance of eight miles. The past year has been the most promising since the district was first prospected.

The Southern District.

Excerpts of some of the most important parts of Mr. P. B. Freeland's Report on the Southern District follow:

Granby, Consolidated Mining, Smelting, and Power Co., Phoenix.—About 444,500 tons of copper ore was shipped from these mines to the Grand Forks smelter during the year. This tonnage is below that of 1917, chiefly owing to smaller ore-bodies and their increasing distance from the centre of operations. Sickness caused by the Spanish influenza created a shortage of labor and a reduction in tonnage.

Canada Copper Corporation.—The Mother Lode mine operated steadily until about the end of November, when the Canada Copper Corporation ceased operations at their smelter at Greenwood. About 163,382 tons of ore was shipped during this period. The Sunset mine has also closed. About 2,697 tons of ore was shipped.

Camp McKinney.

The Consolidated Mining and Smelting Company of Canada did a considerable amount of work upon its holdings in this camp during the summer. A continuance of some of the quartz leads were uncovered, showing a fair amount of mineralization.

In the fall the West Kootenay Power Company established two camps near the old Cariboo mine and commenced cutting a right-of-way for the high-power electric line which, it is understood, will pass through the McKinney camp on its way from Greenwood to Copper mountain.

Osoyoos Mining Division.

Hedley Gold Mining Co., Ltd.—This company has operated the Nickel Plate mine steadily throughout the year in spite of the increased costs in labor, supplies, etc. About 70,100 tons of ore has been crushed and treated in the company's mill.

Golconda Claim.—In 1917 3,390 lb. of molybdenite was shipped to Ottawa. On driving the main tunnel ahead on the lead, the molybdenite to a great extent disappeared and a good grade of chalcopyrite was encountered. Transportation difficulties prohibit shipping any low-grade ore from this property. About 10 tons, carrying 18.1 per cent copper, was sent to Trail.

Similkameen Mining Division.

Canada Copper Corporation, Ltd.—The chief energies of this company during the year have been confined to building a 2,000-ton concentration plant at their mill-site, situated about four miles from Princeton. In connection with this plant, the erection of houses for their employees, a school-house, and every facility necessary for the welfare of families has been thought of. A branch of the Kettle Valley Railroad from Princeton to Copper mountain is under construction at the present time.

At the mine, on Copper mountain, work practically ceased during the summer; all the development-work having been done that was necessary until the concentration plant has been installed. A more detailed account of this mine and its mill will appear in the 19 Annual Report of the Minister of Mines.

Tulameen River.

The strong demand for platinum caused a great deal of activity in the vicinity of the Tulameen river. Besides numerous small placer-workers, the Munitions Board, of Ottawa, under the direction of G. S. Mackenzie, did a considerable amount of drilling, with the intention of ascertaining the possibilities of working the gravels profitably for platinum.

It is improbable that the price of platinum will keep up to its present price for any length of time, and the drilling of these gravels and the ascertaining of the quantities, if any, of platinum is seemingly necessary, to provide against any such contingency as that which arose during the period of the war.

Olivine Mountain.

A Vancouver syndicate obtained some holdings on this mountain early in the year, and prospected it with a view of mining certain localities for platinum and chromite. Some segregations of the chromite have been found to contain platinum in small quantities, but these segregations are so scattered that profitable mining is at present out of the question.

On the north side of Olivine mountain some good showings of copper sulphides and carbonates have been uncovered by Andy Jensen, of Tulameen. Assays from these showings run up to 4 per cent copper. The locality is worth of some investigation.

The Eastern District.

Mr. A. G. Langley, of the Eastern District, includes in his report the following interesting notes:

Sitting Bull.—Very little work has been done on the property during the year by the owners, pending the installation of a compressor plant, which they propose to make as soon as the new road up Boulder creek is built. The future development-work will consist of driving an adit-tunnel at a location easily accessible and free from snowslides to tap the vein at a lower level. Ore is exposed in the upper workings along the course of the vein, but on account of the rugged and steep nature of the country these workings cannot be worked with safety during the winter months. Some 30 tons of high-grade silver-lead ore are ready for shipment.

Trojan Group.—This group comprises six claims and is situated on Boulder creek at a distance of eight miles from Athalmer, the nearest point on the railway. Access is gained by a good wagon-road to within three miles of the property, and for this distance there is a good 4-foot trail. The property formerly known as the Delos group was bought by the Trojan Mining Corporation, a company promoted in Spokane by F. Wonn, who is also largely interested in the Sitting Bull mine. E. D. Smith is in charge of the development-work. The ore occurring in the quartz-filled vein is principally chalcopyrite, with occasional

values in gold and silver. A sample of ore from an open-cut on the surface ran as follows: Gold, a trace; silver, a trace; copper, 15.5 per cent. There were between two and three car-loads of ore ready for shipment, and the manager now reports that he has nearly 300 tons available, and which he hopes to haul out during this winter. During the year development has been confined to surface work along the outcrop and to the continuation of the old tunnel. Surface improvements consist of commodious camp buildings suitable for a crew of about twenty-five men. The new road up Boulder creek, which has been completed for a distance of five miles, leaves the main road up Horse Thief creek at a point of 7.4 miles from Wilmer.

Fort Steele Mining Division.

Sullivan.—This mine, which is by far the largest producer of lead and zinc in British Columbia, has been steadily operated by the Consolidated Mining and Smelting Company, who report that there is an immense tonnage available for extraction and treatment. The output of this mine, which could be worked to much greater capacity, just about equals the total output of lead and zinc of all the other mines in the Province. Latterly about 300 men have been employed at the property. Shipments for the year are as follows: Lead ore, 30,554 tons; zinc ore, 96,950 tons; and iron pyrites, 4,582 tons. The long adit-tunnel which is being driven from Mark creek is now in about 4,600 feet.

Ainsworth Mining Division.—Near Ainsworth.

Bluebell.—This mine has been operated steadily during the year under the management of S. S. Fowler. On account of a large flow of water, work has been discontinued in the lower workings of the mine, pending the installation of a new pump. The concentrator has not been run during the year, the output of the mine being derived from a large body of oxidized silver-lead ore on the surface. This was extracted by "glory-hole" method and taken out through an adit-tunnel. During the year over 5,000 tons of crude ore was shipped to the Trail smelter.

Florence.—This property, consisting of eight Crown-granted claims, is owned by the Florence Silver Mining Company, of which F. R. Wolfle is manager and Hewer mine superintendent. The mine is developed by means of over 10,000 feet of underground workings. The concentrator, which is situated on the shore of Kootenay lake, is said to have a capacity of 150 tons. Water-power to run the plant is developed on Woodbury creek under a 350-foot head. A large gang of men was employed by the company during the year, and over 2,000 tons of silver-lead-zinc concentrates was shipped to the Trail smelter.

Near Kaslo.

Cork-Province.—Mining and development work have been actively carried on during the year under the management of W. E. Zwicky. The production shows a substantial increase over that of last year. A Minerals Separation flotation plant consisting of fourteen 4 x 12 cells, three Wilfley tables, a Dorr classifier, and other equipment was added to the mill during the year. About 800 tons of silver-lead concentrates has been shipped to Trail during the year. Latterly the property has been temporarily closed down.

Curle Manganese Group.—This property, which is situated on the Kaslo & Nakusp Railway at a short distance from Kaslo, was partly developed by Col. Mill, of Spokane. The first shipments contained such a high percentage of moisture that it was found necessary to install a dryer. The results evidently did not meet with much success, and after shipping fifteen cars of ore the property was closed down in October. The ore runs from 34.5 to 49.5 manganese, is low in silica and iron, and may be classified as a good grade of wad. It is possible that the failure to make a success of the venture may be attributed to unfamiliarity with mining and treatment methods for this class of ore.

Sandon Camp.

Conditions in the Sandon camp have been better than for many years past, and the prospects for a large increase in production from the surrounding district is most encouraging, providing market conditions remain favorable.

Clarence Cunningham, who has been carrying on progressive mining and development work at his various properties, has done a lot to stimulate the industry in the Slocan and elsewhere.

Besides the Queen Bess, which is proving to be one of the richest mines in the Division, he is operating the following properties, in which, all told about 250 men are employed: Idaho-Alamo, Sovereign, Wonderful, Van-Roi, Hewitt and Wakefield.

At Alamo a 150-ton concentrator is nearing completion. The plant will be operated by water-power developed from the North fork of Carpenter creek.

The Surprise Mining Company has also been very active this year, and recently acquired the Ivanhoe group and adjoining claims of the Adams group. The company is also operating the Bosun mine, where sixty men are being employed. The ore from this mine is concentrated at the Rosebery mill. The entire output from the properties operated by this company is shipped to the United States for reduction, under arrangements of a long-term contract.

Slocan Star.—This mine is now being operated by the Silversmith Mines, Limited, under the management of R. H. Stewart. A large shoot of ore was recently developed on the tenth level, which is the lowest point in elevation in the Sandon camp at which ore has been developed. After nearly a year's idleness the mill was again started in October, and it is to be now hoped that the mine will once more rank among the leading producers of the district.

Silverton Camp.

This camp has been a little quieter than usual on account of the temporary close-down of the Standard mine, which for many years has been the leading shipper of the Slocan. However, further development-work is being done, and it is to be hoped that before long it will again become one of the large shippers. In the meantime the mine is being partly worked under lease by L. McPhee and partner. Small shipments are now being made to Trail.

Echo.—This mine, situated above the Standard and on the same lead, promises to be an important shipper in the near future. Arrangements have been made to lease the Standard mill, and a tramway has been built from the mine to connect with the Standard tram. J. P. Bonner is mine superintendent.

Queen.—This property, together with the Vancouver Kootenay Belle, and Alexandria claims, has been bonded by A. W. McCune, of New York, who has for many years taken an active interest in the mines of the Kootenay district.

Due to economic conditions brought about by the high price of labor and supplies, the Queen closed down in 1916, having produced up to that date over a mil-

lion gollars in gold. Work has been commenced on a crosscut tunnel running south-easterly across the various properties. The erection of a 200-ton mill is contemplated, should the development come up to expectations. The above may be considered the most important development-work now taking place in the Nelson Division, and will have a far-reaching effect on the Sheep Creek camp.

The following is a list of shippers of the Slocan Mining Division, giving the approximate tonnage shipped or milled by each property during the year:—

	Ore Tons.
Anna group, Sandon	17
Best, Rambler	37
Canadian, Sandon	11
Echo, Silverton	90
Freddy Lee, Sandon	40
Gem, Sandon	70
Idaho-Alamo, Sandon	127
Ivanhoe, Sandon	53
Jo-Jo, Three Forks	10
Lucky Jim, Zincton	6,450
No. 1, Sandon	81
Noonday, Sandon	5
Payne, Sandon	72
Queen Bess, Sandon	2,710
Rambler-Cariboo, Rambler	10,000
Reco, Sandon	19
Richmond-Eureka, Sandon	66
Silversmith, Sandon	2,940
Sovereign, Sandon	84
Surprise, Sandon Bosun, Sandon	16,500
Wonderful, Sandon	32
Standard, Silverton	45,000
Galena Farm, Silverton	15,000
Van-Roi, Silverton Hewitt, Silverton	8,000
Lucky Thought, Silverton	129
Molly Hughes, New Denver	19

Rossland Camp.

The output of the Le Roi-Centre Star group has exceeded that of last year, although the production of these mines was greatly curtailed during the latter six months of the year on account of economic conditions not being favorable for the mining and treatment of low-grade ores.

Of the other mines, the production of the Le Roi No. 2 shows a substantial increase over that of last year, while that of the White Bear compares favorably with the previous year.

The Velvet mine has been taken over by the Granby Consolidated Mining and Smelting Company, who have had a crew of men steadily employed at development-work.

The following list shows the approximate amount shipped by each property during the year:—

	Tons.
Centre Star-Le Roi	89,374
Le Roi No. 2	18,416
White Bear	1,408

Revelstoke Mining Division.

Lanark.—A hydro-electric plant capable of developing 250 horse-power has been installed on the Illecillewaet. The power is used for running the concentrator and the compressor at the mine. Operations at the mine consisted of further development-work and the prospecting of a new lead which shows up strongly on the surface for a distance of approximately 20 feet. W. B. Dornberg is manager. Ten or twelve me are employed.

Woolsey Group.—Situated on Silver creek at a d tance of seven miles from Albert canyon. A good tr from the Illecillewaet river to the claims was co pleted, as was also a bridge across the river. Qu a little excitement was created by reports of the pro erty being bonded to the Mining Corporation of Ca ada. C. E. Watson, general manager of the compa was prepared to proceed with the development of t claims under an option and upon the recommendat of his engineer, R. O. Randolf. Both of these gent men lost their lives in the wreck of the "Princ Sophia," and it is reported that the deal has fal through. Cabins have been erected on the claims a everything is in readiness for next season's work. Th vein is strong and well defined, having a width i places of about 15 feet and containing some excell t exposures of silver-lead ore near the surface. Th continuity of the ore has still to be proven by furt r development; very little prospecting has been d e on the vein so far. The ore is principally galena, wi a little zinc-blende. The silver values run as high s 80 oz. The zinc and lead are not intimately mix d, while the gangue is quartz, conditions which mad it an ore admirably suited for concentration.

The Western District.

General conditions during the year are summari d by Mr. Brewer, of the Western District, as follow

During the past year, while there has been no phenomenal progress in coal and metalliferous mi g in the district, there has been a steady advance, wh h would have undoubtedly been more marked ex pt for the difficulty in obtaining capital, labor, and o- toms for the shipment of ore to Coast smelters. Th epidemic which raged throughout Canada and he United States during the last quarter of 1918 ha a very marked effect on the mining industry gener ly as in many camps there was fully one-third of the or mal force of workmen absent from work either by ea- son of their own sickness or because of sickness in th families. This was particularly noticeable with re gard to the coal-mines and the Britannia cop r mine.

The high cost for labor and supplies, together wi the difficulty in obtaining capital, deterred the p e cution of much development-work in metallife ous mines, but to a great extent this has been offse by new development-work that has been done by the co liery companies of Vancouver island, which wi l referred to in detail later in this report.

At the beginning of 1918 it was anticipated th the lack of smelting facilities in this district, o in to the closing-down of the Ladysmith smelter d in the later part of 1917, would be removed by that s e er being blown in early in 1918, but all hope from h source had to be abandoned, as the smelter ha r mained idle except during a few weeks last sum r when about 2,000 tons of copper-gold ore that h accumulated earlier in the year was smelted, af which the plant was again closed down and is idle.

Wages paid to all classes of miners have adv ced steadily during the year, and to such an exten tho many coal-miners are receiving as much as $10 da and upwards, and the minimum wage since th las increase made on November 1st is about $5 a day Wages in the metalliferous mines have been adv ced

from time to time during the continuance of the war to keep pace with the advancing price of metals. This fact has had a deterrent effect on the progress of gold-mining, because the price of that metal is fixed and does not fluctuate; but, so afr as this district is concerned, gold-bearing ores are rarely found, except such ores as carry gold values in association with other metals, and generally the gold content in such ores is very low.

Fortunately there have been no labor troubles that resulted in strikes in this district during the past year, although such were threatened, but the questions in dispute were settled by conferences in which the employers, employees, and Government officials participated.

Early in the year there was considerable agitation with regard to promoting the iron and steel industries in the Province, and as the great bulk of the known iron-ore deposits that occur in British Columbia are found on Vancouver and adjacent islands, this movement naturally created much interest in this district. It resulted in the engagement of Dr. Alfred Stansfield, of Montreal, by the Hon. the Minister of Mines to investigate and report on the possibilities and feasibility of smelting the magnetite ore in electric furnaces. The report has not yet been published, so it is impossible to discuss it in this preliminary statement.

The discovery of a good grade of manganese ore in deposits which promise to develop into ore-bodies of considerable extent was made in the mountains adjacent to Cowichan lake, Vancouver island, during the past summer. Owing to the demand for ferro-manganese on account of the war, this discovery created a good deal of interest, which, however, abated to a great extent when the armistice was signed. The future importance of the occurrence of this mineral will now depend upon demand and supply, which govern the markets of the world, and whether the demand for ferro-manganese on the Pacific coast is sufficient to warrant the erection of furnaces in British Columbia to supply the demand. A large number of samples taken by different mining engineers from the Hill 60 group of mineral claims, which contain the deposits most easy of access, assayed from 40 to 50 per cent manganese, with the silica content of those samples between 13 and 18 per cent, with no iron or phosphorus.

Considerable prospecting was done during last summer for molybdenite ore, and occurrences of that ore were found on Buttle mountain, near Cowichan lake, Vancouver island, also on the mainland near Agassiz, and on the upper Stave river, as well as in the Cheam range, about twenty miles east of the town of Chilliwack. The development-work done on the various mineral claims that contained deposits of this ore was quite limited in extent and no production was reached.

The development-work done on metalliferous mines in the Western Mineral Survey District during 1918 was confined principally to the Britannia, Marble Bay, Sunloch, Old Sport, Monitor, Indian Chief and Blue Grouse mines, which will be further referred to later in this report.

There was a discovery of seepages of oil in the vicinity of Burnaby lake in the spring of 1918, on Land Section 130 in the south-east corner of Burnaby Municipality. The seepages were examined by the writer during the early part of May, and a sample taken showed from analysis that the oil has a paraffin base. The pool sampled was at the root of an old tree, about 4 feet deep and full of oil and water. The seepages appear to occur along a zone where holes had been sunk with a post-auger by J. B. Woodworth, lessee of the land section, some to a depth of 15 feet, in peat marsh, and oil-scum was noticeable on the surface of the water in several of the holes in the marsh.

Later in the year the lessee and associates organized the Spartan Oil Company, Limited, and after securing the advice of W. R. Jewell, Kansas City, U.S.A., geologist and petroleum engineer, decided to bore a test-hole with a diamond drill at the point selected by Mr. Jewell. This work is progressing at the time of this writing, the drill having reached a depth of 875 feet, with the core showing that the drill is boring in sandstone at that depth.

Copper ore carrying varying values in gold and silver was shipped during 1918 from the following named mines in the Western Mineral Survey District: Britannia, Marble Bay, Blue Grouse, Ingersoll, Indian Chief, Monitor, Willow Grouse, and East Sooke. The Britannia and Marble Bay were the only regular shippers, the other mines mentioned being irregular or spasmodic. During the coming year it is expected that the number of shipping mines in this district will be increased by the addition of the Sunloch, on Jordan river, and possibly the Yreka and Old Sport, on Quatsino sound, as well as the Lucky Four, in the Cheam range, near the Canadian Northern Pacific Railway.

Iron ore was shipped during 1918 from the bog-iron ore deposit near Mons, on the Pacific Great Eastern Railway, and from the Good Hope mineral claim, on the east coast of Texada island, all of which was treated at the Irondale furnace, in the State of Washington.

The Britannia Mine.

After devoting considerable space to coal mining operations Mr. Brewer describes the activities of the Britannia Mining Company, one of the big producing concerns of the Province, as follows:

Britannia Mine.—The operations of the Britannia Mining Company are, of course, far more important than those of any other company in the Western Mineral Survey District, and for that reason the following description of development work and improvements that have been carried on during 1918 are given in more detail in this preliminary report.

The following shows the development work performed in the mine: Drifts, 9,837 feet; crosscuts, 4,427 feet; raises, 8,754 feet; chutes, 1,541 feet; winzes, 36 feet; total, 24,595 feet.

Development-work.—In the Fairview mine drifts have been extended on previously developed veins, also new ones have been opened up to the south, on which stoping operations have started. The outside glory-holes were worked during the open season (seven months), breaking ore on top of the mountain into large transfer rock-chutes delivering it to the underground crushers with but one handling.

The Bluff mine to the west and the Empress mine to the east of the Fairview have been extensively developed during the year and stoping has been started. Two drifts are being driven west under the Jane mine on the 1,200-foot level, developing this ore-body 200 feet below any previous working-level.

During the year another connection through Britannia mountain was made, this being on the 600-foot level, making the fourth level to have portals on both the north and south side of the mountain. Two other levels, the 1,200 and 1,600, are being driven through

for connection, the former having approximately 1,600 feet to go and the latter 700 feet.

Work is progressing for the extension of No. 1 shaft from the 1,000-foot level to the 700-feet level, and also the extension of the Grandview shaft (No. 3 shaft) from the 500-foot to the 700-foot level. This construction will in time supplement the No. 2 shaft, now operating between the 1,000-foot and 500-foot levels.

A crosscut adit, 8 x 8 feet, known as the Victoria tunnel, to the east of the present Empress workings, at the elevation of the 1,800-ton level, has been advanced 400 feet to prospect the extension of the veins in that section of the property. Another crosscut, 8 x 8 feet, known as the Hillside tunnel, is being driven at a point west of the present Jane mine at an elevation of the 1,000-foot level. This has advanced approximately 200 feet.

Considerable diamond-drilling has been done during the year, prospecting new areas and also to prove the extension of known ore-bodies. The footages driven in the different mines are as follows: Fairview, 15,062 feet; Empress, 4,897 feet; Bluff, 2,404 feet; Jane, 2,071 feet; 3,100-foot tunnel, 690 feet; 2,700-foot tunnel, 1,558 feet; total, 26,682 feet.

The 4,100-foot level tunnel, the portal of which is about the level of the roof of the mill, was advanced 1,735 feet during the year, making the total length 4,220 feet. This tunnel will eventually be used as the main haulage adit. A raise has been started at this level and driven a distance of 100 feet. This raise will be continued to the 3,100-foot level, a distance of 1,130 feet, and from there to the 2,700-foot level, 370 feet. This raise is 7 x 12 feet and is being driven on a 65-degree slope.

The 3,100-foot level east drift was advanced 659 feet, and from this drift another drift 260 feet long has been driven to the location of the proposed raise from the 4,100-foot level, from which point it is proposed to raise to the Armour crosscut, 2,700-foot level, at the westerly end of the tunnel railway. The Armour crosscut has been driven a distance of 502 feet.

The raise from the 4,100-foot level to the 2,700-foot level will be used to transfer the mine ore to the 4,100-foot level, and thence a distance of about 5,000 feet by railway to the mill.

The 2,200 Daisy tunnel was advanced 910 feet, making the total length 1,309 feet, and a crosscut 106 feet long driven to the south.

The Harp tunnel was advanced 811 feet to completion during the year. This tunnel is 2,246 feet long and will be used to divert water for power purposes.

The following tunnels driven for development-work were advanced during the year: Lantz tunnel, advance for year, 60 feet; footage to date, 890 feet. Lloyd tunnel, advance for year, 71 feet; footage to date, 134 feet. Copper mountain tunnel, advance for year, 152 feet; footage to date, 324 feet.

Equipment.—Four Westinghouse 3½-ton storage-battery mine locomotives were added to the previous equipment of eight, in addition to which there are in the mine one 6-ton General Electric trolly locomotive and two 3½-ton Westinghouse trolly locomotives.

Fifty-four 2-ton automatic side-dump cars were added to the mine equipment, making a total of approximately 150 cars of this type. Besides these, twenty cars of the same type and size, but built for a 3-foot gauge, were added to the equipment for handling ore broken on the 2,200-foot level and for outside tunnels having a 3-foot gauge.

The present equipment of the tunnel railway consists of ten 20-ton bottom-dump cars; twelve 20-ton side-dump cars; two flat cars; four 15-ton electric locomotives; one 8-ton electric locomotive; and one 40-ton electric locomotive. The 40-ton locomotive was added during the year.

The present equipment of machine-drill sharpeners, including those located at outside tunnels, as well as at the mine proper, consists of nine Leyner machines, four Sullivan, and one Waugh.

A 3,600-cubic-foot-per-minute compressor, driven by a 600-horse-power output motor, was installed in the Beach power-house.

No new buildings were erected at the mine, with the exception of a concrete storage or root house; outside dimensions 38 x 30 feet, with an inside height of 9 feet at the crown of the arched roof. This is located at the tunnel cook-house and affords an excellent place for the storage of winter vegetables.

Profits of B. C. Mining Companies.

The following statement shows the dividends declared by operating metalliferous-mining companies during the calendar years 1914, 1915, 1916, 1917, and 1918:

The amount of $2,691,592 shown above as distributed profits for the year 1918 by no means represents the total of net profits earned during that year. A glance at the published accounts of several of the companies for their respective last fiscal years will make it clear that in these several instances there was as well a substantial sum placed to the credit of Profit and Loss Account.

It will be noticed that the Standard Silver-Lead Company suspended dividends in 1918, although the company operated and made a profit. None of the coal companies are listed as dividend-payers, but doubtless profits were made. Similarly, profits accruing to small companies and individual mining enterprises as a rule are not given publicity as dividends as is the case with the large companies, so that no record of these profits, which in the aggregate are considerable, is available.

Name of Company.	1914.	1915.	1916.	1917.	1918.

Developments in Northern Manitoba

Survey for the Railway From The Pas to Flinflon Copper Property.

The reconnaisance survey for the railway from The Pas to the Flinflon copper property has been completed by J. P. Gordon, acting for the Canadian National Railway. There were two alternative routes in mind. The first was in a northerly direction from The Pas to Cranberry Portage, at the east end of Lake Athapapuskow, and thence westwards along the north shore of Lake Athapapuskow to the Flinflon property. This route, although somewhat longer, would have the advantage of passing through a part of the mineral belt east of Lake Athapapuskow where several discoveries have been made, and where the proximity of the railway would lead to rapid development. The other route follows the west shore of Lake Athapapuskow and thence northwards past the Mandy property to the Flinflon area. It has been found that this is the more practicable route, as a line along the north shore of Lake Athapapuskow would necessitate very heavy building across the strike of the rock. As the railway would touch the west arm of Lake Athapapuskow, which is throughout a navigable lake, the property along the shore of this lake would be connected by water with the railway.

Developing Copper Deposits Along H. B. Railway.

Interest has been recently taken in copper properties in close proximity to the Hudson Bay Railway from Mile 168 to Mile 195. Prospecting has been carried on here for the last four years, and high values in copper have recently been obtained at a depth of 60 feet. The transportation situation is very attractive. It is understood that deals are going through which will lead to early development. These claims are also of interest in that they indicate the continuation of the copper belt considerably further east than good values have previously been obtained.

C. P. R. May Tap Western Section of Pas Mineral Belt

It is also of interest that the Canadian Pacific Railway authorities contemplate the building of a railway from Lanigan northwards to Cumberland House on the Saskatchewan River. It would appear that this projected railway is pointing northwards into the western section of the mineral belt.—R. C. W.

CANADIAN MINING INSTITUTE.

The following will be elected by acclamation as Members of Council of the Canadian Mining Institute:

Vice-Presidents: Balmer Reilly, Cobalt, Ont., and John T. Stirling, Edmonton, Alberta.

Councillors: J. A. Allan, Edmonton, Alberta; R. C. Wallace, The Pas, Man.; Thos. Cantley, New Glasgow, Nova Scotia; Alfred J. Tonge, Glace Bay, Nova Scotia; Robt. A. Bryce, Toronto, Ont.; E. T. Corkill, Copper Cliff, Ont.; Geo. H. Gillespie, Madoc, Ont.; Jas. G. Ross, Montreal, and H. T. Russell, Montreal.

Mr. D. H. McDougall has been re-elected a member of council of the Engineering Institute of Canada.

A. I. M. E. ANNUAL MEETING.

Lessons learned from the war by the American mining world will be applied toward greater progress in American mining at the 119th Meeting of the American Institute of Mining Engineers, which will be held in New York during the week of February 17th. Prominent members of the Canadian Mining Institute, National Research Council, the American Institute of Electrical Engineers, will join the American mining experts in their discussions.

At no period in the history of American mining have the problems of production, especially as to labor and scientific processes, been so momentous as to-day, and at this meeting important readjustment plans will be presented. The program calls for ten business sessions, at which some forty subjects will be presented; a number of social features of a metropolitan kind, and an all-day excursion to the Federal Shipyard in Newark Bay where the first electric-welded ship is being built.

It is expected that this meeting of the Institute will be attended by mining experts from every state in the Union, and from a number of foreign countries, who are identified with the most important mining operations now going on. Many of these men have in the past two years been serving the Government in their respective fields, and scores of them have been dollar-a-year men at Washington.

At the joint session with the electrical engineers there will be six important papers on the subject of electric-welding. Some of these officials of the National Research Council and Emergency Fleet Corporation, who have participated in the development of electric-welding which has made great strides forward in the war work of the last two years.

The Institute meeting will open on Monday morning, February 17th. Tuesday will be Canadian Mining Institute day, and Wednesday will be featured by the session with the electrical engineers and the National Research Council session, followed by the annual banquet in the evening. The excursion to the shipyards will take place on Thursday, February 20th.

The officers of the American Institute of Mining Engineers are: Sidney J. Jennings, President; L. D. Ricketts, Philip N. Moore, Past Presidents; C. W. Goodale, First Vice-President; George D. Barron, Treasurer; Bradley Stoughton, Secretary.

FLIN-FLON.

During the past few weeks the following story has been published in some of our newspapers. We are unable to obtain any confirmation of it. "It is rumored that the British Mineral Resources Commission may take over the copper deposit at Flin-Flon, and develop it as a national utility. There are 25,000,000 tons of copper sulphides blocked out there, with an estimated value of $250,000,000. The world needs this wealth of minerals, and it is urged that the government, through the commission, take over and nationalize it for the people. The proposition is thought to be too large for private interests to develop, and it is stated that there is very little likelihood of the present owners going ahead on account of the huge amount of capital required to make a start."

A RAILWAY TO FLIN-FLON NEEDED.

Regarding the recent trip of Mr. J. P. Gordon from The Pas to Flin-Flon, "The Pas Herald" says:

Mr. Gordon declined to discuss his trip in detail, but he thought the road could be built at a light cost, with light grades and curvatures and light bridging. He stated that the distance would probably be near 75 miles, and with sidings and terminals the total steel required would figure around 82 miles. In his opinion this railway would have great scenic value, in addition to the great commercial value for which it is intended to be constructed.

It is known that the owners of the sulphide ore mine at Flin-Flon have stated that "We cannot attempt to treat or develop this ore body without transportation." Mr. John Black, head of the syndicate controlling it, advises that it is definitely determined that 25,000,000 tons of ore lies at Flin-Flon lake, and he adds that this is a very low estimate. It is estimated that the railway from The Pas will cost two million. The Mandy mine, with thousands of tone in reserve, is not included in this estimate, and neither are the numerous small prospects scattered throughout the Athapapuskow copper field.

This railway, when built and in operation, will not only serve the Athapapuskow copper field, but it will, in addition, be the main highway of Northern commerce, such as fur and fisheries, and the tungsten and iron deposits at Puckatawagan.

Mr. Gordon's trip is preliminary to a survey, and it is expected that this will be done while the weather conditions are favorable for getting in supplies and in getting over the ground.

MORE BRITISH MANUFACTURES ON FREE LIST.

The British Trade Commissioners in Canada (Mr. G. T. Milne at Montreal, and Mr. F. W. Field at Toronto), have received cable advices from the Department of Overseas Trade (Development and Intelligence), that a wide range of British manufactures have been placed on the free list, and now require no export license:

Lists of goods for which export licenses are still required for shipment from the United Kingdom will shortly be in the hands of the British Trade Commissioners noted above. They will also be advised weekly, by cable, by their department in London of the goods removed from such list and any alterations thereto. The British Trade Commissioners will be glad to take up these matters with local importers, and others interested.

The following are some of the principal commodities for which licenses are still required: Abrasives, agricultural machinery, cement, chemicals (various), coal and coke, oils, pipes (cast iron), packing cases, railway material, resins, coal tar products, copper (wrought and unwrought, including wire); alloys, dyes, foodstuffs, food for livestock, glue, iron angles, bars, billets and constructional material, steel angles, ingot plates and similar raw materials, textile machinery, textile yarns, fibres and waste, tin plates, war material, wire rope, wood and timber. The prohibition of the exportation of raw materials does not extend to goods manufactured from such materials.

MANAGER BRIGHAM'S REPORT ON HOLLINGER.

Significant statements appear in the general comments of Manager A. F. Brigham on operations Hollinger mine in 1918. He says:

The tonnage is approximately as shown in la year's statement, as no effort was made to effect an increase in the face of greatly adverse labor conditions and high prices for supplies. We have, however, kept abreast of a materially increased tonnag All veins have generally maintained their values, an in the case of No. 84 marked improvement has ol tained between the 425 and 800-feet levels. Belo the 800-feet level work has practically been suspend ed pending better conditions as noted above.

The ease and efficiency with which the tonnag treated during the year was handled, indicates tha we have no cause to anticipate anything but satis faction from this department.

Anything that has been said or written about th effect of shortage of labor and high prices for ma terial upon working costs during 1917 applies wit greater emphasis during 1918 and is reflected in ev ery item of the statements.

The disabilities under which the gold mining in dustry has been carried on owing to the transitor habits and shortage of miners, obtained its maximun when, in November, the number of men engaged un derground reached the low figure of 482 as com pared with 849, the highest. We had for competitor the silver, nickel and copper mines, which could ad vance wages easily, as the price of their product in creased. We, on the other hand, soon got to our lim it, as the price of gold did not move.

Now, however, with peace assured, all are thankfully and hopefully looking to the future for a return to more normal conditions when the slow process of readjustment is completed.

CLAIMS AT PINEROOT WILL BE DEVELOPED.

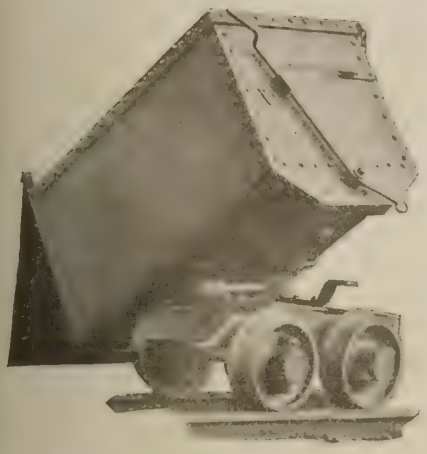
According to "The Pas Herald," six mining claims at the mouth of the Pineroot river, in the Athapapuskow copper field, belonging to Messrs. E. L. Masterson, Dr. Robertson, W. J. Young and J. Maxwell, of The Pas, have been optioned to C. W. Greenlees, of Duluth, for $135,000. A cash payment of $1,000 was made for the option, and the terms of the sale are that the payments will be made in three instalments extending over a period of three years. Mr. Greenlees agrees to keep five men permanently at work developing until the payments are all made .

These claims were staked in 1914, and considerable stripping has been done. The discovery was made on copper sulphides, and this appears to be the chief ore content. Mr. Greenlees, it is understood, is representing Duluth interests. He is a mining engineer, and has spent some time in The Pas field.

Not far from this group of six claims is located the Chica group, where a diamond drill was operated during the summer of 1918. The Chica is said to be backed by Steel Trust officials. The Pineroot river has come into prominence more recently, owing to the activities of prospectors in that vicinity, and also on account of the report that the Chica will resume diamond drilling in the spring.

ROTARY MINE CARS

Roller Bearing, or not, as desired



Will dump at either side or either end, and positively will not dump until in the desired position.

Made any size or capacity, and to fit any gauge of track.

We also make any other type of Mine Car you want. Let us Tender on your next order.

HAVE YOU EVER SEEN OUR NEW MINING CATALOG?

Marsh Engineering Works Limited, Belleville, Ontario

ESTABLISHED 1846

Sales Agents: MUSSENS LIMITED, Montreal, Toronto, Winnipeg and Vancouver

FOR SALE

Silver Assay Balance, Troemner 10 in. Beam, Weighs easily to .05 MG. Sensitive to .03 MG. Price $60.00.

MILTON HERSEY CO., LTD., MONTREAL

CUT GEARS

All Types - Any Size
Large Capacity

Hamilton Gear & Machine Co.
Van Horne St. - TORONTO

FOR SALE—TWO CLAIMS

Adjoining Hattie Gold Mines in Coulson, Beatty Area
Would give Working Option to responsible parties

H. C. CROW, 184 Sunnyside Ave., TORONTO

BURNS & ROBERTS LIMITED

MANUFACTURERS OF STEEL PLATE WORK
Tanks, Air Receivers, Penstocks, Etc.
Dealers in Railway and Power Plant Machinery
BANK OF HAMILTON BDG. TORONTO

FOR SALE

1 4x8 Marathon Mill, with 7 tons of grinding rods from 5/8 to 1¼ in. diameter, and 7 tons extra 1¼ in. rods. The delivery of this mill was too late for the purpose for which it was bought, so it has not been used.

1 12-in. x 15-in. two-drum Jenckes Tandem Hoist, with one 20-in. auxiliary drum and one nigger-head mounted on the shaft extension. Second-hand, but in good condition.

1 Steel Mast, 11 x 17 inches, 45 or 60 feet long, equipped with all sheaves, foot castings and swivel top piece for 12 guy wires.

1 1 cu. yard Mansfield back dump Excavator Bucket, second hand.

McKinley-Darragh-Savage Mines Limited

COBALT, :: ONTARIO

C. P. R. ASKS FOR CHARTER FOR LINE TO THE PAS COPPER FIELDS.

In the Canada Gazette of January 18 there appears a notice of the intention of the C. P. R. to apply to this session of Parliament for a charter to construct a railway line to The Pas copper fields.

The application is based on the desirability of tapping the great mineral belt of The Pas, and connecting it by direct line to every large point in the prairie provinces, and particularly to furnish direct transportation from the coal fields of Alberta, and for the economical transportation of western grains to tide-water, via the Hudson Bay Railway.

The preamble of intention indicates that the proposed line will be constructed from Lanigan, on the Pheasant Hills branch, in Saskatchewan, and in a norther-easterly direction to Cumberland House, passing through the rich Carrot river valley and near Melfort.

THE SMELTER RATES INQUIRY.

Having visited the management of the Consolidated Mining & Smelting Co. of Canada at the Trail Smeltery, where a full discussion took place regarding their investigation and its scope, the members of the Committee of Inquiry into the rates charged for treatment of custom ores at Trail, is engaged in making preparations for the securing of evidence from all who are interested. In this connection a circular has been issued and is being distributed among all shippers independent of the company. It reads as follows:

"This committee has begun its work. While it has extensively advertised its wish to receive either oral evidence as to facts or opinions of shippers of ore to Trail concerning their relations to the smelter, it feels that further opportunity should be afforded for hearing from any who have thus far failed to make their position known to the committee.

"For this reason a copy of this letter is being sent to all shippers to ask their wider and continued cooperation towards making our investigation completely successful and satisfactory to all concerned.

"Appreciating the fact that some shippers may naturally not desire to make statements in any public way, we wish to impress on you and them the fact that we are quite prepared to afford every reasonable opportunity for private hearing and discussion and that we will endeavor to make arrangements for this if necessary after hearing from you.

"We wish particularly to have it known that it is not only the matter of rates and charges as such that come within the purview of our work but the collateral matter of sampling, settlement, or anything else which may, and often does, cause dissatisfaction.

"We shall be glad to receive any communication or complaints touching these matters and trust that such will be sent to the secretary not later than the 12th February next."

Mr. Clifford E. C. Smith, who was nominated for election as a councillor of the Canadian Mining Institute, has declined the nomination on the ground that Ottawa should be represented. Mr. Geo. Mackenzie, of Ottawa, was nominated, but his nomination was invalid owing to late delivery of the mail. Mr. Smith favors the renomination of Mr. Mackenzie.

CANADA COPPER CORPORATION.

A large part of the machinery for the concentrating mill to be installed at Allenby, B.C., by the Canada Copper Corporation has reached Princeton, a few miles from its destination, and is awaiting the completion of the branch railway to Allenby. This line now is almost completed. It is understood that no time shall be lost in preparing the mill for operation, as arrangements otherwise are well in hand for the shipment of ore from Copper Mountain.

"The conditions surrounding the business of the Canada Copper corporation generally speaking, and particularly the completion of the underground program at the mine and the progress in the construction of the mill, have been entirely satisfactory, the schedule set for this work having been maintained to date, despite the usual condition affecting all industries which has existed during the period," says President Mayer in a New York report. "It appears to me, and to the engineers directly in charge of the construction work, and therefore most familiar with the conditions, that the estimate made that the plant should commence operations this coming summer, will be realized."

"In view of the fact that ample ore had been developed to supply the mill for many years, the mine was shut down in September, sufficient development work having been done to quickly place the mine in a position to supply tonnage to the mill on its completion. The mine camp at this time is completely closed down.

"The expectancy of developing considerable additional ore remains the same and a substantial area is still to be prospected to confirm the unknown possibilities in this direction."

"WAR TEMISKAMING."

The Temiskaming district will soon be known throughout the British Empire as the district that established a record in Canada as subscribers to the Dominion Victory loan. The means to let the world know of its patriotism will be furnished by the good ship "War Temiskaming." This boat is named in honor of this district, by the Canadian Government, for setting a lead in the recent Victory loan campaign.

The "War Temiskaming" was launched at the Polson Iron Works Company's docks in Toronto on Saturday, Feb. 8. The honor of christening the boat fell to Mrs. R. S. Taylor, wife of the chairman of the Temiskaming district, and the well known hardware merchant.

Among those present were G. H. Wood, Chairman of the Ontario division, Geo. C. Wallace, organizer of Temiskaming, and F. Montye Macrae, organizer of the northern division.

Temiskaming subscriptions to the loan aggregated $7,000,000, of which $2,500,000 has been credited to Toronto, owing to the head offices of some of the mining companies being in that city. Temiskaming raised double its objective.

IRON ORE IN 1918.

Statistics and estimates of the United States production of iron ore in 1918, compiled under the direction of Ernest F. Burchard, of the U. S. Geological Survey, Department of the Interior, show a moderate decrease in output compared with the high records of 1916 and 1917.

EDITORIAL

AERIAL TRANSPORT IN MINING DISTRICTS.

There has naturally resulted from the great developments of recent years in aircraft many suggestions as to the utilization of the air for transportation. In Canada we are particularly interested, for this country has produced a very large number of capable flyers. Toronto is regarded as the greatest aircraft and flying centre on the continent. The Royal Air Force owes much of its success to the young Canadians who learned to fly in this country. We look to some of these men to become adventurers in the far north. Some will doubtless become leaders in transportation, furnishing facilities to mining men for reaching new districts that are at present difficult of access.

We venture to predict that it will not be many years before our great hinterland will be dotted with service stations for the accommodation of flyers who will carry men and supplies to out of the way places. Those who undertake the pioneer work in such an enterprise will encounter many difficulties, but like our older pioneers they will push on until success is won. That exploration will be much more rapid when air transportation is available is obvious. At present the explorer spends most of his time getting to and from the areas he wishes to explore. The flyer will take him there quickly and will come back later with supplies or to bring him home. Already something has been done in South America in this connection. In a paper presented at the New York meeting of the American Institute of Mining Engineers last week, Mr. George M. Dyott, of London, said:

"There are many who may consider a paper on aerial transport and its possibilities in connection with mining operations somewhat premature. Nevertheless, as there is considerable interest manifested in the subject at the present time and the amount of information available is both scanty and misleading, the result of investigations in some of the remote mining districts of Peru will not only be of interest, but will help crystallize, in the minds of many, a more correct conception of just what an airplane is capable of doing.

"By way of introduction, I will deal briefly with the types and varieties of airplanes now in use, and the developments of the past few years, pointing out how the war has encouraged machines of startling performance rather than those of commercial utility. I will then take up aerial transport in general, showing how airplanes may be employed to advantage and the particular kind of work for which they are best suited. This will cover a preliminary discussion on cost, which is one of the most important phases of the subject. In passing on from a general survey of the situation, I will deal with actual observations and investigations made in Peru. This part of the paper will be divided into two sections: the first, covering the mountainous districts of the Andes (Tamboras, Pataz, Soledad, etc.); the second, the alluvial deposits in the rivers, Chinchipe, Santiago, and Napo. In each case the question of atmospheric conditions, altitude, landing grounds, motors, cost, etc., will be discussed. While it is my intention to deal chiefly with mining in the sections mentioned, the same line of argument will be applicable to any other districts in the world. In conclusion, I will touch on the possibilities of using lighter-than-air craft of the Zeppelin type, followed by a summary of the most salient points brought out in the paper.

"In a general way the points emphasized will be: 1. That freight can be carried by means of airplanes. 2. That certain kinds of freight are more suitable for aerial transport than others. 3. That aerial transport will not compete with existing methods of transport, but will extend their sphere of usefulness. 4. That airplanes will prove a valuable adjunct to many mining operations. 5. That certain mines, which it is now impossible to open, can be put on sound lines of development by the intelligent use of air craft. 6. That many gold-dredging operations can benefit by the employment of flying boats or hydro-airplanes."

MINING LAW.

One of the most interesting discussions at the meeting of the American Institute of Mining Engineers in New York last week was that on mining law. The speakers did not stay very close to the text, "a uniform mining law for North America," but they presented many views and told of conditions in many mining districts. This information will make a good introduction for the discussion which is to take place at the meeting of the Canadian Mining Institute in Montreal next week.

It was made clear by the speakers that the great variety in mining laws is unfortunate, but likely to continue. By many the mining laws with which they were most familiar were considered fairly satisfactory, the chief objection of some to the differences seems to be the necessity of learning new laws for each district. Some prefer freehold to leasehold. Some prefer leasehold. Some regard freehold and leasehold as distinctly different and would estimate the freehold title to a mining property to be of much greater value than a

leasehold. Others contend that the leases as granted in Canada are in effect the same as freehold, being for twenty-one years and renewable.

The inclusion of the provision for discovery of "valuable mineral in place," in the requirements for staking of claims, received some attention. It was pointed out that in some cases it is impossible to make such discovery at the surface and that a very large expenditure for exploratory work is sometimes necessary. In such cases the prospector has no protection from others who might wish to unfairly take advantage of his work.

As pointed out by Mr. Gibson and Mr. Godson, the requirement that "valuable mineral in place" must be discovered before a claim is recorded, is a feature of the Ontario mining act that is not taken seriously. In the early days of the Cobalt silver boom it was found advisable to insist on such discovery. It was in an endeavor to do so that inspectors of mining claims were appointed. These men visited the claims and if they reported "no discovery," the claim was refused. There is naturally considerable difference of opinion concerning the possibilities of any mineral deposit and the system of inspection soon fell into disfavor. Inspection is not now carried on in Ontario, but the law remains unchanged.

In the discussion at the New York meeting there seemed to be general approval of the suggestion that the prospector should be allowed to judge for himself whether his claim was worth doing work on or not. It was admitted that the discovery of "valuable mineral" should be required; but that there should be no undue haste or confidence in concluding that any mineral discovery was not valuable. "Give the prospector the benefit of the doubt," says Mr. Winchell. No man can with the certainty that he is right say that a deposit should not receive attention. He may properly advise against expenditure of time and labor when the chances seem very slim; but, on the other hand, he should not be put in a position where he would prevent the willing prospector from working when he wants to do so.

The mineral rights in the public domain in the United States are controlled by the Federal Government. The States have little to do with mining law so far as alienation of property is concerned. In Canada, however, most of the provinces have control of their own natural resources and there are almost as many varieties of mining laws as there are mineral producing provinces. The differences are, however, not so great but that they might be removed. It would certainly be an advantage to prospectors to have a uniform law. It will not be easy, however, to determine what laws are most suitable. If the Canadian Mining Institute can do something with this problem it will help the industry by helping the prospectors.

CANADIAN DAY AT THE A. I. M. MEETING.

Tuesday, February 18, was Canadian Mining Institute day at the New York meeting of the American Institute of Mining Engineers. At all the annual meetings there have been present members from Canada, but for this meeting all members of the Canadian Mining Institute were invited. The Directors of the American Institute of Mining and Metallurgical Engineers, as it is now known, entertained the officers of the Canadian Mining Institute at luncheon. The day was spent in discussions on topics of mutual interest, several Canadians taking a leading part. At the meeting in Montreal next week the Americans will be the guests of the Canadian Mining Institute. The discussions started in New York will be continued at Montreal. Incidentally Americans and Canadians will become better acquainted. We are pleased with this new expression of the good feeling between the mining men of the two countries.

THE SILVER MINES.

With bi-metalism once more being seriously discussed by leading metal authorities, and with apparently at least fair prospects of some such development taking place before very long, the mines of Cobalt find themselves occupying a position of perhaps greater advantage than any other silver producing mines in the world. Some of the heaviest producers of silver in the United States are operated chiefly for the copper they contain, the white metal being but a by-product, whereas the mines in Cobalt are operated entirely for the high grade deposits of native silver which they contain. It is an interesting fact that many low grade silver mines in other countries were compelled to close down during the war, while in Cobalt great prosperity has been experienced during the period of greatest strain. The high grade nature of the deposits made this possible. According to local opinion, it is small wonder, therefore, that metal authorities in other countries are becoming alarmed over the great decline in silver production from their low grade mines, and small wonder that the mines of Cobalt should be operated unremittingly and at the fullest possible capacity. In view of this favorable state of affairs as far as Northern Ontario is concerned it seems reasonable to anticipate increasing activity in the Gowganda field also, as well as in the Elk Lake and the South Lorrain areas, and in the vicinity of the CaseyCobalt mine in the township of Casey.

The moving of the recording office from The Pas to Dauphin, Manitoba, has not yet been satisfactorily explained. To us it seems absurd. The Minister of the Interior will do well to reconsider the matter, or to at least give his reasons for making the change.

President Timmins' Report to Hollinger Shareholders

In the report to the shareholders of Hollinger Consolidated Gold Mines, Limited, for the year ending Dec. 31, 1918, President Timmins says:

The balance carried forward is $2,071,287. The tonnage milled was 578,755, from which $5,752,370 was recovered. Other income makes a grand total of $5,908,327. Working expenses absorbed $2,857,510, and depreciation, taxes and donations $462,254, leaving a net profit of $2,588,563, out of which dividends amounting to $1,230,000 were paid and $1,358,563 added to the surplus. The company's cash position has been greatly improved by the purchase of $1,575,000 of Victory Bonds, thus making our total holding of high grade Government and Municipal securities $1,687,717. I am confident the shareholders will approve of the policy of building up such a strong reserve as will be commensurate with the great destiny of the mine and the magnitude of its future operations.

The labor situation already shows signs of improvement, and we dare to express the hope that with the return from overseas of a number of our old employees, and as the country changes more and more from a war to a peace basis, we will be able to speedily secure our full share of skilled and stable men with whom we will earnestly endeavor to establish relations of co-operation and mutual good will. The mine is in such shape that we are able to employ a large number of additional men at good wages, which also brings up the problem of increased housing accommodation, plans for which are now under consideration.

The resumption of the payment of dividends during the year was a matter of special gratification to the directors, and we expect, in the absence of any unforeseen or unexpected contingency, to be able to continue the dividends at the same rate until the general mining situation and the financial position of the company warrant an increase. It is, however, impossible to be more definite in regard to the question of dividends as so much depends upon conditions beyond our control. Shareholders will be kept informed of the position of the company by interim reports which will be mailed to them from time to time.

A matter worthy of mention is the fact that we have completed arrangements to send our bullion to the Mint at Ottawa to be refined. Heretofore bullion shipments have been made to the United States Assay Office, New York City, the company receiving payment in New York funds, thus enabling it to make a very substantial profit by the sale of exchange. However, recent improvements at the Ottawa Mint make it possible for it to treat all our gold bullion, so that, in order to do our part in building up the gold reserves of Canada, and acting in co-operation with the Minister of Finance, we have decided to send our bullion to Ottawa, receiving payment in New York exchange.

During the year certain necessary extensions and additions to the plant, which have been deferred owing to war conditions, will be proceeded with. This will involve the completion of the mill, the installation of an extra compressor, the erection of a refinery and other buildings.

As is already known to our shareholders, Mr. P. A. Robbins, who has been our General Manager since the year 1911, retired from office some months ago. Mr. Robbins had long contemplated taking an active part in the war, and when the United States, his native country, entered the struggle, the call for service became so insistent that he decided to give up the position with this company which he had so long and ably filled, and volunteer for service overseas. Our new General Manager, Mr. A. F. Brigham, came to us from South Africa, where he was Manager of the great Jagersfontein Diamond Mines. The company is to be congratulated upon having been able to secure the services as General Manager of such an eminent mining engineer and experienced company manager.

The directors sincerely regret to record the death on the 12th of April last of their friend and colleague, Mr. John McMartin, M.P., Vice-President of the company since its inception. His broad interest in all the affairs of the company and his sound judgment have been greatly missed at our councils. The vacancy on the Board created by Mr. McMartin's death was filled by the election of Dr. Wilfred L. McDougald, of Montreal, Mr. D. A. Dunlap becoming Vice-President.

We have a devoted and competent staff who have carried out their duties with conspicuous ability during another difficult and trying year.

UNEXPECTED LACK OF DEMAND FOR POTASH.

The present is a critical time for the potash industry recently established in the United States, according to H. S. Gale, of the U. S. Geological Survey, Department of the Interior. Prior to the war this country used more than a million tons (gross weight) of potash salts each year, and it has been supposed that the cutting off of a large part of this supply was a keen deprivation, particularly to the farmer, by whom it was used for fertilizer. This foreign supply has not been available during the war, and with much energy and enthusiasm a domestic production equivalent to about one-fourth the former importation has been built up. Now, however, it is unexpectedly disclosed that there is little or no market for potash either at the high prices that have prevailed or even at a considerably lower price. No satisfactory explanation of this situation seems to be offered.

Approximately 100,000 tons (gross weight) of potash salts, produced in Nebraska in 1918, are reported as lying in storage warehouses, distributed throughout the southeastern States, which is in the region where potash is principally consumed. This is of the same quality that was used in 1917, and is immediately available to the fertilizer manufacturer or the farmer. Potash of other sorts from various sources is also reported unsold, though in smaller quantities. As this surplus represents approximately half the relatively small domestic production, and as potash from foreign sources has not been available during the year, it is difficult to explain this apparent lack of interest in the present small domestic supply.

California capitalists are said to have taken an option on the Silver Nugget Group of Claims, situated near Silverton, B.C. The property carries high silver values.

Mining Convention in Vancouver March 17-19.

Vancouver, Feb. 19.

Vancouver is the logical centre for the mining industry of British Columbia and that is one of the things that the committee in charge of the International Mining Convention to be held in the Terminal City on March 17, 18 and 19, is aiming at. By many, Spokane has been looked upon as the headquarters of many of the mining properties in B. C. The Chamber of Mines holds that this condition of affairs is not as it should be, that Vancouver geographically has a prior claim to that position and at the convention steps will be taken to see to it that the commercial capital of British Columbia is accorded the honor to which it is entitled from every point of view.

The mining men throughout the province are keen in support of that claim. Already communications have been received from them notifying the Chamber of Mines—whose name by the way has been altered to the British Columbia Chamber of Mines—that no stone will be left unturned to make the convention an unqualified success. Already a number of delegations have been appointed. The East Kootenay mines and business men will send a big representation to Vancouver. Prince George is taking an interest and the Hazelton district does not intend to be left behind. Kamloops, Vernon, Qeslo, Princeton, Prince Rupert and in fact every important centre in British Columbia expected to be represented.

The change of name of the Chamber was brought about a few days ago and is subject to confirmation. The idea is to make the Chamber more representative not only in name but also in membership. With the last named and in view of the arrangements for the sending of someone into the interior to get together a thoroughly representative committee to take charge of the local delegations are well forward. The committee are aiming at expansion and development along lines that have hitherto not been attempted before and while this will not be in the proper sense a membership campaign, that factor will not be overlooked.

Everything in connection with the convention is proceeding satisfactorily. There is no doubt that it will be a premier gathering in point of importance and attendance not to mention the questions that will be considered. The mining of gold, silver, copper, iron, platinum and coal; the smelting of ores; taxation of companies and many other matters will be brought forward for discussion. It is a big meeting that mining men have been advocating for many years and if the efforts of Mr. J. D. Kearns, the general manager of the convention and those associated with him are to be taken as a criterion, the convention is already an assured success.

In the sixty-five years that there has been mining activity in British Columbia, over half a billion dollars have been taken out of the earth and yet the province has only been scratched. To-day there are greater indications of activity than ever before. The demand for the various metals which are indigenous to British Columbia in the form of ores, is more insistent than at any time in the history of British Columbia, and for that reason if for no other, it is up to the business men of the province and to those whose interest in the industry is comparatively small or nothing at all, to take every step that will eventually assist in putting British Columbia on the map as the premier wealth-producing district of North America.

The convention next month is a means towards that desired end. Strong co-operation and a pull altogether by every section of the province and the result will exceed the greatest expectations of the promoters. This district is being asked to do its share of the work in helping to make the convention a record-breaker and the convention committee have every hope that it will be so.

The exhibition of ores and machinery is to be held in the basement of the Vancouver block and the convention will take place in the Hotel Vancouver where the headquarters will be.

INDUSTRIAL GAS MASKS.

The U. S. Bureau of Mines announces that it is making a preliminary investigation of gas masks with a view to establishing a list of approved devices for use in the mining and allied industries. After the preliminary investigation the Bureau will issue a schedule of tests which apparatus must meet in order to gain the approval of the Bureau of Mines. These investigations will be conducted at the Bureau's Pittsburgh Station by men who have had intimate connection with the development of mine rescue apparatus and gas masks used in warfare.

ASKING FOR BOUNTY ON IRON ORE.

Sir Thomas White, Acting Premier of Canada, was asked by a delegation representative of the Port Arthur, Sudbury, and North Bay Districts of Ontario, which waited upon the Dominion Government early in February, to grant a bounty of at least 50 cents a ton on all iron ore "mined and smelted in Canada," during the next fifteen years. The Acting Prime Minister assured the delegates that the representations made would have the consideration of the Government before the annual financial budget is presented to Parliament, when fiscal changes will be announced. He expressed the appreciation of the Government of the value of the large deposits of iron ore in New Ontario, and the good that would result to the country from their proper development. That the Canadian West is behind this movement for Federal support to the iron and steel industry is indicated by a wire forwarded by Hon. Wm. Sloan, Minister of Mines for British Columbia, to the Board of Trade of Port Arthur, Ont., giving it its hearty endorsation on behalf of the Provincial Government.

During the month of January the Nipissing Mine produced $227,936. A short interruption occurred during the early days of the month, at which time the annual clean-up was being made, as well as certain necessary alterations to the equipment.

Mining interests of the Kirkland Lake district are making an appeal to the Ontario government with a view toward having a branch line of the T. & N. O. Ry., constructed from Swastika to the heart of the camp, a distance of about six miles.

Campbell & Deyell Discontinue Ore Sampling

The firm of Campbell & Deyell, which has this week announced its intention to discontinue its ore sampling business in Cobalt, has been doing business there since June, 1909. During the ten years of operation the firm's plant has always constituted an adequate and independent system of ore sampling. Ore containing approximately 61,000,000 ounces of silver represents the actual amount upon which the firm has been entrusted to place valuation.

To illustrate the responsibility devolving upon such an enterprise, and the position of trust in which it must of necessity be placed, it would perhaps be well to point out that all Canadian smelters and certain of the smelters in the United States accept the valuation of the ore made here, as a basis of purchase. The business of the firm has been primarily that of ore-sampling and assaying, and with its present equipment it has been able to deal with the following varieties of work:—

(1)—The sampling, grading and valuation of ore shipments in transit between mine and smelter; the result of the sampling, or sampling and valuation, serving as a basis of settlement between smelter and mine.

(2)—The sampling and assaying of large or small lots of ore to ascertain the value of its contents in gold, silver or other elements.

(3)—The assaying of samples from mines and concentrators. Also of samples sent in by engineers, prospectors and general mining interests .

(4)—Umpire Analyses—A considerable portion of this and other work is received from a distance; samples being sent in by mail and express from all parts of the country.

General regret is expressed in the north over the intention of the firm to discontinue its ore sampling business. Not a few mines will suffer inconvenience thereby. It will make it impossible to personally supervise the sampling of ore locally, and necessitate frequent journeys to down-country smelters by representatives of a large percentage of the mines. Heretofore it has been possible to have the sampling of ore done subject to inspection at all times; and following the completion of the sampling, a valuation placed on the ore, such valuation being acceptable to the smelters, and the producer knowing exactly the value of his shipment long before such has been treated.

In making any bargain it is necessary for the parties thereto to know two things, in order that the transaction may be carried on efficiently; the exact nature of the articles to be sold, and the exact requirements of the prospective purchaser. Primarily it is required of a mining company to know definitely the nature of the ore which it has to market. Secondarily it must know the requirements of the various smelters in order that each grade of product may be marketed to the best advantage. This, of course, necessitates a careful sampling of each shipment before it is marketed and a business-like handling of each lot of ore according to results obtained.

It has been the aim of the firm of Campbell and Deyell to fill the requirements annotated above. The figures which show a valuation placed on ore sampled at 61,000,000 ounces, in addition to the fact that silver metallics melted and cast into ingots in the firm's bullion department amounts to approximately 1,200,000, testifies to the measure of success which the firm has attained in its endeavor to fill the requirements above mentioned.

B. C. COAL PRODUCTION.

The total amount of coal produced by the collieries of Vancouver Island for the month of January, 1919, was 158,327 tons. This is 18,040 tons more than was produced during December, 1918, and 55,632 tons more than was produced during December, 1917, and 55,-632 tons more than the production of November, 1918. The total of 158,327 tons only lacks 2,831 tons of being equal to what was produced by all the coal mines of the Province in November, 1918, and is 10,000 tons in excess of the largest production in the history of the Vancouver Island Collieries.

The tonnage produced by the various collieries are as follows:

	Tons.
Canadian Western Fuel Co., Nanaimo Colliery	64,404
Canadian Collieries (D) Ltd., Cumberland Colliery	51,666
Canadian Collieries (D) Ltd., Extension Colliery	21,217
Canadian Collieries (D) Ltd., South Wellington Colliery	7,813
Pacific Coast Coal Mines, Ltd., Morden Colliery	4,541
British Columbia Coal Mining Company, East Wellington Colliery	3,543
Nanoose Collieries, Limited, Grant Colliery.	2,697
Granby Consolidated M. S. & P. Company, Granby No. 1 Colliery	2,446
	158.327

The Canadian Collieries (D) Ltd., leads in production with a total of 80,696 tons from their different collieries, with the Canadian Western Fuel Company second with a production of 64,404 tons from their Nanaimo Colliery.

The new No. 5 Mine opened by the Canadian Collieries (D) Ltd., at South Wellington, has an output of 7,813 tons for January. The Granby Company's new mine at Cassidy, V.I., produced 2.446. Both of these mines should now rapidly increase their production.

The Canadian Western Fuel Company's new Wakesiah Mine is now nearing the time when it will become an active producer which should augment that company's tonnage in the near future. Both shafts are now down to coal and connected, and arrangements are under way laying out the shaft bottom arrangements.

These three new mines should give a good account of themselves during 1919, and considerably increase the tonnage produced from the Vancouver Island Mines.

It is stated that returns from the recent shipment of ore from the Foster Mine which is being operated under lease, shows a production of about $80.000 from the high grade ore shoot opened up during the closing months of 1918.

Lower Prices Necessitate Lower Wages to Copper Miners

Production of copper is the most important phase of the British Columbia mining industry. It is so both in respect of the value of output and the number of men employed. The present uncertain conditions in regard to market has led in this Province, as elsewhere, to an unsettled state of affairs as to the immediate future of the industry. But the prospects are not as gloomy as the bare statement of the condition would imply. The managements of the several large mining corporations most affected are facing the problem before them courageously. They have adopted the policy of taking the men into their confidence, clearly stating to them that refusal to accept lower wages means cessation of operations, at least until the re-establishment of a more normal market, and placing on their shoulders to some extent the responsibility of decision.

Reference was made recently to the action of the management of the Consolidated Mining & Smelting Co. of Canada in calling in representatives of their employees, of the explanations that followed as to outlook in regard to the metal trade, and to the statement of the former that, with co-operation from the men, it was the company's confident belief that it would be possible to "carry on" until the market became steady. The condition at Trail, B.C., as a result, is reported to be satisfactory. The strength of the smeltery staff is being maintained with little fluctuation and new work, planned to place the company in a position to handle the business looked for with the commencement of re-construction, is making good progress.

In these days of social unrest, with the virus of so-called Bolshevikism rampant, it is refreshing to find that the same spirit of co-operation is evident among the employees of the Granby Consolidated Mining & Smelting Company at Grand Forks, where the men working at the smelter have agreed to continue at a wage based on the Butte scale. This means that their pay will be governed by the price of copper when a market is available. At Anyox, B.C., the chief industrial centre of the Granby Company, the attitude of the men is not yet definitely known. It is thought, however, that they are likely to adopt the same reasonable view as their fellows of Grand Forks. If this proves so the operations of the company may not be seriously affected. The interruption to an important industry, with its attendant loss of time and money both to employer and employee, may be avoided. At any rate the company has given expression to its desire to do its utmost to keep the wheels moving, and should a sympathetic response be forthcoming from the workers, British Columbia will not suffer as are some of the large copper producing sections of the United States.

The Britannia Mining & Smelting Company, another very large producer, is meeting the situation by rather a different method; but by one which, in the last analysis, works out about the same. Men are being discharged, and no doubt the company's operations will be curtailed in a considerable degree. However, when the men are laid off they are given the option of returning to their jobs at a reduced scale. Many are accepting the proposition. Thus there is no reason for a competent man to be idle. There is work, useful and profitable work to be done, and those with a proper appreciation of the world condition as to metals, and particularly as to copper, are continuing that work.

There is no doubt that the relationship between manager and worker is changing, and very radically, too. It is evident in what has been said as to the position in this Province. Those companies which have treated the representatives of the men as intelligent persons, which have taken the trouble to point out that with no income it is impossible to pay high wages and to explain how it happens that there is no income at present, for the most part find their men standing behind them. And it may well prove that the recognition of the wisdom of such a policy by the companies will lead to the maintenance, notwithstanding existing difficulties, of an industry that means much to the welfare of British Columbia.

THE DOLLY VARDEN AND WOLF PROPERTIES PURCHASED BY TEMISKAMING MINING COMPANY.

Mine operators and prospectors interested in the Alice Arm District, British Columbia, as well as the Provincial Mining Fraternity generally evince keen interest and much gratification in reading a recent Toronto, Ont., press despatch regarding ownership of the Dolly Varden Mine, which reads as follows:

"The shareholders of the Temiskaming Mining Company at their annual meeting yesterday(February 4), consented to the proposal of the directors to extend the operations of the company by taking over the Dolly Varden and Wolf Silver Mines in British Columbia. These mines have been handicapped for some time owing to lack of finances, and the Temiskaming Company has entered into an agreement whereby operations will be resumed. The purchase price of the properties is $900,000, but the obligation to the former holders of the mines is only $450,000 because of the liabilities the Temiskaming Company has to assume."

The railroad from the beach at Alice Arm to the Dolly Varden mine was practically rebuilt and nearing completion when the construction company went into liquidation with the result that most of the mining properties and prospects of the district were tied up. Hopes were entertained, however, that an early adjustment of the railroad difficulties would be arranged and negotiations to that end were entered into.

The Dolly Varden Mines Company owns the Dolly Varden property, which is situated about eighteen miles from tidewater on the west bank of the Kitsault River, and the Wolf property, two miles farther up on the east bank of the Kitsault. The Dolly Varden has been extensively opened up by underground development, and is therefore in condition to start shipping at any time. The orebodies have been proven by thousands of feet of diamond drilling.

On the Wolf property a tunnel thirty-five feet long has been driven in on the ore body, from the face of which a cross-cut to the north fifty feet and to the south ten feet proves the ore body for a width of sixty feet, with neither wall in sight. Several thousand feet of diamond drilling has been done proving the orebody and showing it to be of good milling grade.

The Sullivan Mine

One of the few really big metalliferous mines of British Columbia is the Sullivan, owned by the Consolidated Mining & Smelting Company of British Columbia. Part of the programme of the company's work for 1919 is the extensive development of this property. It has been turning out a large proportion of the silver-lead-zinc ores handled at the Trail Smeltery for some years, but it is proposed, evidently, that its resources shall be exploited to a greater extent and the plans referred to are to be carried out with that end in view. The economic wisdom of this has been emphasized by the reported recent establishment of a feasible metallurgical method of so treating the rather refractory ores of the Sullivan as to secure a fuller return of their content, particular as to lead and zinc.

The importance of the Sullivan mine to the mining industry of British Columbia has long been recognized by the mining men of the Province; but it is doubtful whether its possibilities have been properly appreciated outside that circle. When Mr. Wm. Fleet Robertson, Provincial Mineralogist, first examined the property, then a prospect, he pronounced it the greatest ore deposit he had had the pleasure of inspecting in British Columbia up to that date. He ventured the opinion that, in the hands of men or a corporation with ample capital, it would prove a value asset. Time has fully justified the position he took, but it is questionable whether he, or those who afterwards undertook its development, expected that it would do as well as now promises.

The foregoing has been prompted to an extent by the reading of an article which has been published in the Fernie (B. C.) District Ledge describing the present work at the Sullivan mine and giving some figures relative to its ore reserves. While the latter are large and are uttered a trifle too glibly, it being questionable whether any authority would, at the present stage, care to attempt to say just how many million tons of ore are available, the observations as to general conditions may be accepted and those of a statistical nature may prove, in the course of time, to be justified.

The article reads:

"From all appearances the town of Kimberley, situated eighteen miles north of Cranbrook (B. C.), is due for a boom of great importance. The Consolidated Mining & Smelting Co. of Canada has just completed work on the main tunnel at the Sullivan mine. This tunnel is over two miles long, and will accommodate two standard tracks. It is said to be the longest and best built of any in the world. The cost of this undertaking alone approximates four million dollars. The latest electrical mining machinery was used on the tunnel with a modern equipment of a overhead dump system. The Sullivan group of mines is the richest silver-lead proposition in the world to-day. It is estimated that taking out three hundred tons a day the company has enough ore in sight to last it for one thousand years. At present the company has about 400 men in its employ.

"Contracts will be let at once, it is said, for one hundred modern cottages, which will be erected on the hillside.

"Preparations also are under way for the erection of new buildings to treat the increased output of ore which will be developed as soon as the 800 ft. raise is completed. About twenty cars a day are anticipated.

"By next spring the company expects to employ in the neighborhood of one thousand men, it is stated.

"The Kimberley Miners' Union, it is rumored, has in contemplation the erection of a modern building, which will be utilized both for a place of meeting and recreation purposes. Billiard and pool rooms will be included in the equipment.

"The establishment of a motion picture house, with modern equipment, will also be a part of the Kimberley Progressive Movement.

"The only drawback at the present time is the lack of sufficient water power. There is an abundance of water in St. Mary's River, but sufficient drop cannot be had to enable the generating of power. It is very probable that the Bull River Power Company, in which enterprise the mining company is interested, and on which a large sum of money already has been spent, will be rushed to completion and put into operation at once. With this the rumor of the electrification of the Crow's Nest Pass Railway, and the supplying of power to towns along the Crow, including Fernie and Cranbrook, again is revived."

Dolly Varden Railway.

Victoria, B.C.—The British Columbia Legislature has before it a petition relative to the eighteen mile railway which has been constructed from Alice Arm, B.C., practically to the Dolly Varden mine, which is of special interest in view of the recent announcement that the Temiskaming Mining Company has secured possession of the Dolly Varden and Wolf Silver mines. The petition sets out that the Taylor Engineering Company spent $425,000 on the railway, almost completing it, without being repaid by the owners of the Dolly Varden. It is detailed that the Dolly Varden company was incorporated in 1917 by private bill and that subsequently arrangements were made with the Taylor Engineering Company for its construction. The latter, it is said, received nothing more substantial than promises to pay. Negotiations having been entered into by the Dolly Varden Corporation for the sale both of mines and railway, the contracting company, which since has gone into liquidation, although assured that its interests would be protected, began to manifest some concern, it being alleged that there appeared to be a disposition to attempt to evade responsibility. The petition is an effort to obtain legislative protection for the assets of the railroad builders as represented by the road to which they were unable to give the finishing touches.

Silver Creek Mines, Ltd.

D. Woolsey, managing director of the Silver Creek Mines, Ltd., owners of the Woolsey group of mines near Revelstoke, B. C., was in the Province recently and is confident that the work now in progress will result in the blocking out of a large tonnage of good ore. With good trails for transportation and all necessary equipment present operations will be continued all winter and in the spring it is the intention to complete the construction of a road which was commenced last year. A tunnel has been driven eight feet under the vein and a cross cut is to be started immediately.

Special Correspondence

NORTHERN ONTARIO.

Another New Vein at Crown Reserve.

A second vein which gives promise of being of considerable importance has been cut recently at the 200-ft. level of the Crown Reserve property, at Cobalt. As yet, insufficient work has been performed on this new discovery to definitely gauge its value. A shipment of high grade ore is almost ready to go forward from the vein discovered at this level in the eastern section of the property during the closing month of the last year. Considerable talk is prevalent regarding the likelihood of an early dividend being paid by Crown Reserve, but the oficials of the company are reticent regarding the matter.

Deeping Shaft of Reliance Property.

The shaft on the Reliance property in the southern section of the Cobalt camp has been continued from the 50-ft. level to the 100-ft., and a substantial quantity of ore is being mined. The property is under lease to John Shaw, formerly manager of the Hargraves, and Edward Dean. A force of about ten men are engaged. During the past month the operation has resulted in considerable profit to the leaseholders.

Diamond Drilling Property in Casey Township.

English interests are engaged in diamond drilling a property situated in the immediate vicinity of the Casey-Cobalt mine, in the township of Casey, about nine miles northeast of New Liskeard. Rock formation, which is covered with a heavy overburden, is said to closely resemble that occurring on the Casey-Cobalt, and considerable interest attaches to the undertaking, owing to the long and favorable career of production at the Casey.

Matachewan.

The advent of spring is expected to be accompanied with renewed activity in the Fort Matachewan district. Considerable work is being planned by property owners. Concerning the plans of the Matachewan Gold Mines, which is the leading operation of the district to date, nothing definite has been heard for some time. Late in the fall a four million dollar company was organized for the operation of this property, after a large amount of diamond drilling had been done, which was said to have given satisfactory encouragement for the installation of equipment to mine the property to a considerable depth. A large amount of assessment work falls due in the district during the spring and summer months.

Nickel from Alexo Mine.

During the first week in February the Alexo Mine at Porquis Junction shipped four cars containing approximately 400,000 pounds of nickel ore. The output for the first week of the current month was the highest for some time, and compares with three cars containing 320,000 lbs. during the last week of January. The ore from this mine is shipped direct to the smelter at Coniston.

Miller-Independence will be big Producer.

The announcement of the intention to sink the main shaft of the Miller-Independence mine at Boston Creek to a depth of 500-ft. with lateral work at each one hundred foot level, puts the leading operation of the Boston Creek area in a new light. A substantial tonnage of ore in the neighborhood of $1,000 per ton in value is now in sight, with the indication that these values will prove consistent. In addition to this extremely rich ore, a large quantity of ore which has been generally termed as "high grade" has been opened up. Plans are being made for the installation of a mill and roasting plant of a capacity of 100-tons daily at the property, and it is estimated that an average mill head of between forty and fifty dollars per ton can be maintained at the mine without drawing too extensively on the richest of the ore. It is thus anticipated that the average daily output will be in the neighborhood of $5,000. This would bring the monthly production in the neighborhood of $150,000, or about $1,800,000 yearly. It is calculated the costs of treatment and mining will run about twelve dollars per ton, thus leaving a net profit of not far under $1,400,000 annually, which is equal to about 200 per cent on the company's issued capital of 700,000 shares.

The annual meeting of the company was held at Dayton, Ohio, on February 6th, when the following directors were elected: George J. Miller, John C. Schaeffer, G. W. Ozias, Ed. Rettich, Judge Brown and Frank Groch. The only change in the directorate was the election of the last named gentleman to fill the vacancy caused by the resignation of Mr. Kirkpatrick.

Drilling Cotter Property.

At a depth of about 600-ft. on the Cotter property in the Boston Creek Gold area, the eastern continuation of the rich vein of the Miller-Independence Mines has been cut by diamond drilling. The core of the drill shows splashes of gold, and the assays are high. It is therefore expected that other large operations will soon be under way in the district, as the potential value of any property over which this rich gold deposit passes would appear to be great. The encountering of the vein with high gold values obtaining at this depth of the Cotter property, proves the consistency of the deposit, and adds greatly to the future prospects of the district in general. A large amount of new work has been planned for other properties in the Boston Creek district, and the coming spring and summer gives promise of being the most active for the area since the discovery of gold there. It's easy access to the railway, which passes through the township, coupled with available electric energy, gives promise of rapid expansion, and it is expected the gold production of the province will be materially added to during the current year by the results of production from this comparatively new field.

Patricia.

Arrangements are being made for a resumption of operations at the Patricia property early in March. The Patricia was closed down last fall due to difficulty in securing sufficient fuel with which to provide energy for the steam plant which has been installed, including a small mill. The future plans of operation are said to include the sinking of the shaft to deeper levels with stations at each succeeding 100-ft. The orebody on the property has already been proved to a depth of two hundred feet.

On the adjoining property (the O'Donald) a diamond drilling campaign is being carried out. Favorable developments met with on the various properties in the immediate vicinity will at the same time enlarge the possibilities of the Patricia, as the general strike of the veins is such that those encountered

on the O'Donald will probably be found to continue on to the Patricia.

With the low lying ground solidly frozen it should now be possible to secure ample wood for the requirements of the steam plant which the company intend using until early in the summer, when electrically driven machinery will be installed.

Lake Shore.

With earnings exceeding dividend requirements at the Lake Shore property in Kirkland Lake, it is expected in well informed circles that another dividend will be forthcoming in the very near future. During 1918 the company paid two dividends of 2½ per cent each, amounting to a total of $100,000. The next dividend is expected to be for a like amount and will call for the distribution of $50,000. With the output exceeding the dividend requirements, rumors are current that a 3 per cent quarterly dividend will be paid from this time forward. However, the conservative attitude of the directors leads to the belief that the present rate of dividends are likely to continue, with the possibility of a bonus being paid at intervals when convenient.

The Hollinger Report.

The eighth annual report of the Hollinger-Consolidated Mines, Limited, of Porcupine, gives many interesting facts concerning operations at this big gold mine during the past year. While the report states that very little development work has been done, in the ordinary course of mining during the year, nearly five miles of underground work was done, consisting of sinking, drifting, crosscutting and raising. Almost two miles of diamond drilling was also done at the property. Another extremely important fact is that some forty veins known to occur on the surface, ranging in width from 3ft. to 25ft., and containing average gold values of $9.86 per ton, have not as yet been developed underground, and remain to swell the already huge ore reserves of the mine, which are now estimated at upwards of forty-one million dollars. The following is a concise summary of the performance of the company for the past year:

Total tons treated	578,755
Total recovery	$5,752,370.87
Other income	$ 155,957.00
Total income	$5,908,327.87
Average recovery per ton...	$ 9.94
Costs of operation	$2,857,510.22
Depreciation, taxes, donations	$ 462,354.54
Total cost	$3,319,764.86
Operating cost per ton	$ 4.94
Cost per ton including depreciation	$ 5.73

Another important fact is that the average gold content in the ore reserves of 4,489,080 tons is $9.15 per ton, as compared with an average of $8.95 per ton in the $4,494,510 tons, estimated at the end of 1917. This increase of 20 cents per ton in the grade of ore adds $897,816.00 to the value of the tonnage estimated, and makes possible the addition to the value of the ore reserves of $848,570, which otherwise would have shown a decline of 5,430 tons.

The report of the company is highly satisfactory and demonstrates the strong physical as well as financial condition of the company.

With reference to the existing conditions of labor during the past year the report says: "The disabilities under which the gold mining industry has been carried on owing to the transitory habits and shortage of miners, obtained its maximum when, in November, the number of men engaged underground reached the low figure of 482, as compared with 849, the highest. We had for competitors the silver, nickel, copper and gold mines, which could advance wages easily as the price of their product increased. We, on the other hand, soon got to our limit, as the price of gold did not move. Now, however, with peace assured, all are thankfully and hopefully looking to the future for a return to more normal conditions when the slow process of readjustment is completed."

Dome Lake.

The annual report of the Dome Lake Mining and Milling Company of Porcupine, soon to be mailed to the shareholders, covering operations of the company during the year 1918, will show a total production of upwards of $115,000. In the neighborhood of 12,000 tons of ore was treated, an average of $9.65 per ton being recovered. Costs of production are said to have been $8.27 per ton, which leaves a profit of about $1.38 per ton, or a total profit of between $16,000 and $17,000 for the year. The installation of the cyanide system of ore treatment, which was completed in March last, has resulted in better recovery, the average being about 90 per cent. The outlook for the future is said to show a decided improvement, a better grade of ore being developed at depth. Late reports from the Porcupine district are to the effect that operations at the property are being speeded up considerably, the working forces being added to. It is also reported that an important ore body has been encountered in a raise from the 500-ft. to the 300-ft. level of the property.

Dome to Resume.

Reports just received from Porcupine state that arrangements are being made for the re-opening of the Dome Mines Mill early in the spring. In the meantime additional mine workers are being taken on and underground work is being speeded up daily. It is stated General Manager Keading, who is now in California, plans to return to the mine about the first week in April, and will proceed with immediate preparations for the re-opening of the mill. The enormous amount of underground work done during the past year or so, together with the large tonnage of ore broken in the mine waiting to be conveyed to the mill, assures ample tonnage for the operation of the milling plant at capacity, which is about forty thousand tons per month. Mining and hoisting facilities have been brought up to a high degree of perfection, all of which is expected to help in re-establishing the low operating cost of around $2.60 per ton, for which the Dome was noted before the strain of war was felt. By next mid-summer production should be up to normal and before fall the output might reasonably be expected to exceed all past records. A large ore crusher has been installed at the 800-ft. level, which it is expected will greatly facilitate the handling of the ore. According to the last annual statement of the company ore reserves, which were all estimated above the 700-foot level of the property were close to $10,000,000. With ample labor promised in the near future, the outlook for the Dome exceeding its past enviable record during the current year appears bright.

Tough-Oakes.

At the special and annual meetings of the Tough-Oakes Mines in Toronto on Wednesday of last week, by-laws were authorized for the transfer of the head office of the company from Haileybury to Toronto, and also for the sale of treasury stock at a discount of not more than 55 per cent. This means the stock is not to sell at less than $2.25 per share. Some 78,500 shares of stock remains in the treasury. In reply to questions regarding the affairs of the former directorate and management of the mine, Mr. Harry Oakes, president of the company, said the present directors were not in a position to make any statement as to the present condition of the mine. Members of the former directorate of the company were conspicuous by their absence, none being on hand to explain any of the affairs of the company. The following directors were elected for the current year: Harry Oakes, Dr. R. J. Robins, J. B. Holden, J. Y. Murdock and A. Burt. The official information in the foregoing statements appears to indicate that the Foster control of the Tough-Oakes Mines has ended. It is expected a thorough examination of the mine will follow in the near future, which will provide the new control with the necessary information to intelligently undertake the task of placing the mine once more on a producing basis. Funds for the immediate commencement of this work are understood to be available, and these will be further augmented by the sale of treasury stock as indicated at the recent meeting.

Lake Shore.

For the first month of the company's new fiscal year (December), the Lake Shore Mines of Kirkland Lake produced $45,101 in gold, which slightly exceeds any previous month's output in the history of the mine. The tonnage for the month was slightly lower than the average for the past three months. The average value of the ore treated was $25.04 per ton. The mill ran 95 per cent. of the possible running time. The development work of the month consisted of the following:

200-ft. level.—Drift on No. 2 vein east advanced from 194 to 281 feet, producing milling ore of a good grade for the entire distance.

400-ft. level—The north drift on the No. 2 vein east advaced from 405 ft. to 429 ft., the south drift advanced from 405 to 425 feet.

On the No. 1 vein, west, the north drift was advanced from 332 ft. to 399 ft.

Milling—The mill ran 95 per cent. of the possible running time, producing $45,101.34 from the treatment of 1,801 tons of ore.

Annual Report of Lake Shore Co.

The annual report of the Lake Shore Mining Company, Limited, for the fiscal year ending Nov. 31st, 1918, has been issued. During the eight months and twenty-four days that the mill was operated 14,984 tons of ore was treated, from which a recovery of $24.76 per ton was made, the total production amounting to $370,128. The total cost of operations for the year amounted to $185,461, including $22,285 for depreciation of buildings and equipment and $5,000 for administration. From this is deducted $46,365 incurred during the first quarter before the completion of the mill, thus leaving a total cost of but $139,095, as against the total income of $374,073. The cost of production therefore average $9.30 per ton, including the amount allowed for depreciation. A profit of $234,978 is therefore shown. A commendable feature of the policy of the company is the making of "Provision for Exhaustion," for which the sum of $90,000 was put aside. Since the commencement of milling operations on March 8th last, two dividends have been paid, amounting to $100,000. Each dividend amounted to 2½ per cent., and called for the disbursement of $50,000.

15,175 tons of ore has been hoisted from the four levels of the mine, the 100, 200, 300 and 400 ft. levels. Approximately 80 per cent. of all drifting has been done on ore of milling grade. A large amount of construction work was completed during the year, including: Assay office, refinery chateau, ice house, teamster's cottage, stable and two bungalows. A mine office and storeroom are now under construction. During the summer months exploration work was conducted on other properties in the Kirkland Lake district with a view to benefiting the company and the camp in general.

Owing to the scarcity of labor the work was confined mainly to drifting on the veins, and only raises necessary to secure ventilation were put through, no work having been performed that would actually block out ore, consequently no attempt has been made to figure out ore reserves. The favorable financial situation of the company and physical condition of the property exceeds general expectations. Two new directors were added to the board at the annual meeting. The names of the present directors are: Harry Oakes, A. G. Slaght, W. P. St. Charles, C. E. Wettlaufer, and Albert Wende. The new directors added to the board are Louis Oakes and W. H. Wright.

Elliott-Kirkland.

Several hundred feet north from the main workings of the Elliott-Kirkland property, a large break has been cut in a contact between the conglomerate and porphyry formations by diamond drilling. Most important, perhaps, is the fact that a belt of conglomerate some 400-ft. in width has been pierced. On the north side of this conglomerate where it comes in contact with the porphyry is where the break occurs. It is understood that the drill passed through a mud seam about two feet in width from which water flowed quite freely. Such mud-seams have been associated with some of the richest deposits in the Kirkland Lake camp, which lends to the discovery more than ordinary interest. It is understood the company contemplates the early development of the contact zone north of the present main workings.

May Re-open Lucky Cross Mine.

Negotiations are said to be under way for the reopening of the Lucky Cross mine at Swastika, which is the jumping-off place on the T. & N. O. railway for the Kirkland Lake camp. The plans are said to call for the organization of a new company. The previous operation and development of the property was conducted prior to the opening up of the Kirkland Lake field. With this camp firmly established and on the threshold of becoming a large gold producer, it may reasonably be expected that such properties as the Lucky Cross, which is equipped with a good plant and milling equipment, will come in for further attention. Although previous development work was on a limited scale, a number of veins containing visible gold were found, and the property as so far developed has considerable merit.

Important Developments at Crown Reserve Properties.

Development work at the Crown Reserve mine at Cobalt is proving a series of veins in the eastern section of the property where the recent important vein was encountered. Since the original discovery was made a number of other promising veins have been encountered and are now being developed. Arrangements have been made for the shipment of the first carload of ore from the first vein discovered in this section of the property. As the ore shoot has contained average values of around 2,500 ounces to the ton, for upwards of 150-ft. in length, it is expected the first car of ore will be exceptionally high grade, and should compare well with the shipments from the property in the early days of the mine. Considerable ore is coming from the old workings of the property. In addition to the revenue of the Cobalt property, the Crown Reserve owns a controlling interest in the Porcupine Crown Mines. This latter property has resumed operations and should add considerably to the revenue of the company in the near future. Ore has been developed on the Porcupine Crown mine to a depth of 1,100 ft.

Testing Adanac Ore.

A trial run of Adanac ore consisting of fifty tons was put through the Temiskaming mill at Cobalt this week. The ore was taken from the drift along the high grade vein recently opened up at the 310 ft. level of the property and is understood to consist of "Mine Run" ore, no attempt having been made to sort the material. No official announcement of the grade of the ore has yet been given out.

Nipissing Will Develop Ophir Property.

The shareholders of the Ophir Mining Company unanimously ratified the deal whereby Nipissing mining company of Cobalt purchased a two-third interest in the Ophir property for $150,000. The Nipissing mining company has been in possession of the property since January 19th. The new owners of the property propose to prosecute development work energetically on the contact, which is found at a depth of 580 ft. on the Ophir. The north line of the property is 1,200 ft. south of the Adanac, and for this reason, coupled the fact that there are a number of large and strong veins on the property, the prospects are considered bright.

Temiskaming.

An announcement of more than ordinary interest has been made to shareholders of the Temiskaming mining company that the company had acquired the property of the Dolly Varden Mines, and Wolfe Silver Mines, situated in British Columbia, on the Kitsalt river about fifteen miles from what is called Alice Arm. This property on previous development has given encouraging results. Mining carried out to date consists of several hundred feet of underground work, as well as several thousand feet of diamond drilling. The purchase price of the property is $900,000. Obligation to former holders of the mine is $450,000 because of the liabilities that the Temiskaming has to assume. A narrow gauge railway has been constructed from the point on the coast known as Alice Arm to the Dolly Varden property. However, some couple of miles of steel have still to be laid and the road is in the hands of a receiver. This financial condition will be remedied and the road completed by the Temiskaming mining company. The terms of the deal are said to enable the Temiskaming to recoup itself for these expenditures out of the mine before paying any portion of the purchase price to the vendors. The properties were examined by Mr. C. D. Keading, manager of the Dome Mines of Porcupine, for the Temiskaming and it is said upwards of two million ounces of silver is in sight. Both the Dolly Varden and Wolfe camps are reported to hold considerable possibilities both as regards extent and richness, and lie within nine miles of each other. It is said that the railway may eventually be extended several miles further to the glacier foot, where rich copper deposits are said to exist. The undertaking is an expensive one, and results will be watched with the keenest of interest by Eastern Canadian mining men.

Allied Gold Mines Will Develop Property at Boston Creek.

Beginning with the early spring an extensive exploration and development program will be carried out on the properties of the Allied Gold Mines, Limited, at Boston Creek. Even at the present time a good deal of work is being done, including extensive diamond drilling to determine the width and value of the veins opened up on the surface of the property. The company was organized late in 1918, for the purpose of acquiring a large acreage of gold mining lands in the Boston Creek area, following the successful developments at the Miller-Independence Mines. The first group of claims secured were the Cullen-Renaud, which adjoin the Miller-Independence on the north, and which has a continuation of part of the rich vein system opened up on the latter property to a depth of 200 ft. It is on this vein that the Allied Gold Mines is driving a shaft to a depth of 100 ft. by using hand steel. It is the intention of the company to instal an electric mining plant early in the spring to facilitate this work. The second group of claims taken over by the company was the O'Donald, comprising some five in number, situated between the properties of the Patricia Syndicate and R. A. P. Syndicate and Boston Creek Gold Mines, Limited. With the completion of the diamond drilling campaign on the O'Donald group it is expected a mining plant will also be installed here for the further development of the property. The capitalization of the Allied Gold Mines is $2,000,000 in shares of the par value of $1 each.

Connell Property Sold.

Dayton, Ohio, interests are said to have purchased outright a three-quarter interest in the Connell property in the Boston Creek district, adjacent to the Miller-Independence property on the east. The owners retained a one-quarter interest in the property. It is understood the full purchase price of the three-quarters interest was paid.

Developing Bourke's Property.

A winze is being sunk at the 200 ft. level of the Bourke's Mines at Bourke's Siding. The vein is said to continue strong in the working and to yield encouraging quantities of high grade gold ore. A drift has been run for a considerable distance at the 200 ft. level and encouraging quantities of good grade ore have been revealed.

Alexo Nickel Ore Shipments.

During the last week in January three car-loads of nickel ore were shipped from the Alexo Mine at Porquis Junction to the Mont Nickel Company at Sudbury for refining. The three cars of ore aggregate approximately 320,000 pounds of ore, the shipment being much above the average for a similar period. The Alexo is the only base metal mine producing in this part of Northern Ontario, and its growth since the outbreak of the war has been comparatively rapid due to the big demand for nickel.

Elliot-Kirkland.

Opening up of the fractured zone recently encountered at depth on the Elliot-Kirkland is being gone ahead with on the surface of the property. The break is in the porphry formation close to the contact of the porphry and conglomerate. Up to the present time it has been opened up at two points a distance of about 400 ft. apart, where it has been found to be about twelve ft. in width and to carry low gold values. It has a general strike towards the shaft of the Kirkland Lake Gold Mines, Limited, and is thought to be a branch of the orebody occurring on the latter. There appears to be some likelihood of this northerly branch being the cause of the occurrence of more or less patchy ore on the break further south where sinking was carried to a depth of 600 ft. on the Elliot-Kirkland.

Sinking Shaft on Kirkland-Townsite.

The shaft on the Kirkland-Townsite property has been sunk to a depth of over forty feet. The vein is well mineralized at this depth, with considerable graphite occurring in the seams and along the walls. The shaft will be sunk to a depth of 100 ft., where lateral work will be undertaken.

Tough-Oakes.

The plan for the amalgamation of the Tough-Oakes Gold Mines with the Sylvanite and Burnside properties, the latter controlled by the Aladdin Mining Company of Cobalt, appears to be looked upon with much favor by some of the leading interests involved, and the possibility of bringing about the proposed merger is considered very promising. If the merger is successfully completed it should prove of much benefit to the three properties mentioned. The Tough-Oakes is equipped with a powerful mining plant and a milling plant with a capacity of 140-tons per day which would be immediately available for the development and production of ore from all three properties. It would be possible to develop all three properties from the one central shaft on the Tough-Oakes. This is particularly to be desired where the orebodies are in some cases extensions of veins running from one property onto the other. The three properties each have a large acreage and the deposition of ore on each is related, either by being the lateral continuation of veins or the downward continuation of orebodies dipping from one property into another. The new directorate of the Tough-Oakes, headed by Harry Oakes, is making a change in the management of the property and a new manager is being sought. Similar changes are being made in other departments.

Kirkland Lake Mine Nearing Producing Stage.

With the new shaft of the Kirkland Lake Gold Mines, Limited, nearing the 500 ft. level of the property and being connected up at each level with the old workings of the property, which were carried to a depth of 700 ft., and with considerable lateral work on each level, facilities for hoisting ore to the new 150-ton mill will be provided. Everything should be in readiness for the commencement of production within the next two weeks. However, it is not considered likely that actual milling will commence until some time in March, when it is thought a considerable improvement will have taken place in the supply of labor available, and the difficulties attendant upon cold weather will not have to be contended with.

A good deal of the ore on the dumps is from development work and will carry gold values of around $8 per ton, but the ore developed underground is said to carry value in the neighborhood of $15 per ton. Allowing for the mill running at two-thirds capacity on this latter grade of ore the output of the company would approximate about $45,000 per month. After the first few months of operation and with the mill working at capacity this production should be increased by about fifty per cent. The future outlook of the Kirkland Lake Gold Mines is considered to be bright. The controlling interest in this company is held by the Beaver Consolidated Mining Company of Cobalt.

Resumption of Work at Schumacher Mine Expected.

The Schumacher Gold Mines, Limited, of Porcupine is expected to be the next important gold mine in this district that will resume operation. Previous to closing down in point of production the Schumacher was next in importance to the Porcupine-Crown Mines. However, with the proposed additions to the mill completed, it is expected to be second only to the McIntyre-Porcupine Mines. During the fiscal year ended March 31st, 1918, the company spent about $51,000 on additions to the milling and mining plant, the capacity of the mill being increased from 110 to about 180 tons per day. The mining plant was enlarged for the operation of 25 machines instead of 14 as were formerly employed in development and supplying ore for the mill. With the addition of another Hardinge ball mill and another tube mill, it is officially announced the capacity of the mill could be brought up to 300-tons per day. With this addition to the plant installed it is evident the production of the property would be in the neighborhood of $60,000 per month, as the average grade of ore is stated to be between $6 and $7 per ton. The future plans of underground development call for the sinking of the main shaft to a depth of 1,000 ft., at which point lateral work will be carried forward, with the object of encountering the downward continuation of the present known orebodies. This plan is considered to be important and full of promising prospects, owing to the fact that excellent ore was developed at depth on the McIntyre-Porcupine and Hollinger properties which adjoin. Especially is this true of the McIntyre, where it was not until a depth of 1,000 ft. had been attained that the property had definitely established itself as a mine of big proportions. With similar geological conditions prevailing on the Schumacher, it is considered highly probable by prominent mining men that similar conditions may be encountered on this property. The mine closed down July 15th, 1918, at which time a surplus of

$81,901 was shown. Since that time the shareholders have authorized the sale of 100,000 shares of treasury stock at not less than 45 cents per share. Thus, sufficient funds should be available for the carrying out of the extensive program outlined, and the placing of the property on an earning basis sound enough to warrant the payment of dividends. The authorized capitalization of the company is $2,000,000 divided into 2,000,000 shares of the par value of $1 each. Of this number of shares some 1,850,000 shares have been issued. With the additional one hundred thousand shares authorized to be sold the treasury will still have fifty thousand remaining. The current year should be an important one in the affairs of the Schumacher.

BRITISH COLUMBIA.

May Operate Ladysmith Smelter.

If the assurances given by those interested are implemented by action there is a prospect that the Ladysmith smelter, of Ladysmith, B.C., will be in operation again before long. Mr. W. J. Watson, who is in charge of the plant, has just returned from a conference with Mr. Seiberling, of Akron, Ohio, and associates. He states that it is Mr. Seiberling's intention to commence, without delay, the development of several good North Pacific mining properties. One of these is situated on Latoache Island, and is adjacent to the well-known Alaska-Gatineau Copper mine which is a regular shipper to the Tacoma smelter. Other first-class prospects have been secured, and will be opened up with as little loss of time as possible. The intention is to open the Ladysmith smelter again, and this time permanently, when there is enough ore in sight to secure a sufficient supply to keep the furnaces of the smelter in continuous operation.

Mining Convention at Nelson.

Mr. Fred A. Starkey, President of the Associated Boards of Trade of Eastern British Columbia, has announced that the Northwest International Mining Convention will be held at Nelson, B.C., this year. While the dates had not been definitely fixed they would be placed either in the latter part of the month of June or early in July. It was explained by Mr. Starkey that the Spokane Convention was to take place at that city in March. He will attend and proposes inviting the delegates to Nelson and to ask them to arrange a time that will meet with the convenience of the majority. It is understood to be the wish of most of the American mining men that the International Convention should be assembled at Nelson and Mr. Starkey is asking his fellow citizens to give the visitors just a little better time than on the last occasion, which in point of instruction and entertainment stands out as almost the ne plus ultra.

Copper Miners' Wages Reduced Owing to Lower Prices for Copper.

Notice has been posted at the Grand Forks (B.C.), Smelter of the Granby Consolidated Mining & Smelting Company to the effect that the company proposes reducing the wages of its employees according to schedule affected by the drop in the price of copper. No statement is yet made as to the price at which the metal will be placed.

Molly Gibson Employees Victims of "Flu."

Operation of the Molly Gibson mine, near Nelson, B.C., has been seriously interfered with recently by the ravages of the Spanish influenza. The plague struck the camp without warning. Ronald Stonier, the superintendent, and one of the miners were dead before anything was known of the trouble outside the immediate district. Of the eleven men working at the mine seven fell ill and, when the news was received, a relief party consisting of twelve men, among whom was a physician and one of the engineers of the Consolidated Mining & Smelting Company, started out in order to take the five reported to be still alive to the Nelson Hospital. Subsequently two of the latter succumber and another miner was killed by a slide shortly after setting out for the city. Thus there were five deaths within a short period and it has been suggested that the series of fatalities will result in the closing down of the property for the winter. This, however, has not been confirmed.

With reference to the "Flu" and the difficulties which some mining operators have experienced because of it, an interesting account is given of the method adopted by a mining man with extensive interests around Sandon and Silverton, B.C. He has an understanding with his men that during the epidemic none of his men are to leave his employ, nor to come down from the mines for a "lay-off." On his part he undertakes to send no new men to work. The particular properties that he has in charge are thus rigidly quarantined and he himself, according to the arrangement, cannot go up to them, even on a trip of inspection. Consequently he is forced to direct operations by telephone. While this is awkward, it is thought better than to take the chance of the influenza gaining a foothold in any of the camps in question as, judging by other experience, once established at such centres it does not leave until the lives of many are seriously jeopardized and the work completely disrupted.

Thomas French Explains Difficulties.

Thomas French, manager of the French Complex Ore Reduction Company, the plant of which is situated at Fairview, B.C., a short distance from Nelson, B.C., complains that the action of the Provincial Government in deducting more than $6,000 from a bond issue of $25,000 guaranteed by the Government last year in order to pay back interest on previously issued bonds and delay experienced in obtaining the money, have seriously interfered with his programme for the demonstration of the French process for the treatment of complex zinc ores.

The position in which he finds himself is explained, from his standpoint, in a recent interview as follows:

"In 1916 the late government guaranteed a $40,000 bond issue to enable the company to equip the Fairview plant for the purpose of demonstrating its process. This was $10,000 less than Mr. French at the time estimated he would require, but although the price of machinery rose considerably before the money became available, he was able to keep within his estimate. The terms of the Act, however, prevented Mr. French from borrowing money from the bank to finance operations and to purchase ore. Delays, while overhead expenses continued—the Act compels the company to operate without ceasing — used up additional funds.

(Continued on page 130.)

Roseberry-Surprise Mill Closed Down.

Sandon, B.C. — The Roseberry-Surprise Mill has closed down and the ore milled at this plant in the past will be milled hereafter by the Roseberry Mill. To the community of Sandon this is a decided setback, as it constituted one of its chief industries and employed a large number of residents, mostly men of families, who will be without work.

Florence Silver Mining Co.

Ainsworth, B.C.—For ore shipped in the month of December the Florence Silver Mining Company, operating at Ainsworth, has received a preliminary settlement of $27,200 net. The shipment amounted to 400 tons and the adjustment is at the rate of $68 a ton on 90 per cent of the metallic content, leaving a final payment to be based on market conditions. January shipments amounted to 350 tons.

Rambler-Cariboo.

Slocan, B.C.—The Rambler-Cariboo Mines in the Slocan has declared a dividend of $17,500 according to a recent announcement. This is at the rate of a cent a share on the issue of 1,750,000 shares. Payment will be made February 15 to stockholders on record February 5. The forthcoming disbursement will increase the total of dividend payments to $560,000. An estimate places the company's surplus at $55,000, which includes ore in transit and at the smelter, of which there are 60 tons of lead concentrates valued at $7,500 net and 165 tons of zinc valued at $20 a ton. Operations at the mill have been interrupted by a snowslide which halted the flow of water. The slide which came from Payne Mountain, covered the flume for 200 feet to a depth of 20 feet in places. The snow is being removed and the flow is expected to be restored soon. There is a difference of 1,200 feet in the elevation of the mine and the mill. Little exploration was done in 1918 owing to the high cost of supplies, transportation and labor.

Mining Convention at Vancouver.

March 17, 18 and 19 are the dates selected for the international mining convention which is to be held at Vancouver, B. C., under the auspices of the Vancouver Chamber of Mines. Committees are to be formed in each mining centre of the province in order that every district will be represented not only by delegates, but by a representative display of its mineral products. Prominent mining men of all parts of America are to receive invitations and a special effort is to be made to secure the attendance of professors of mining and geology of the different universities of the continent. One of the features is to be a display of mining machinery which, if the officials in charge realize their ambition, will be the finest and largest of its kind ever attempted in Canada. The Convention has received the endorsation of Hon. William Sloan, Minister of Mines, and of other members of the Provincial Government.

Rich Samples From Proserpine Mt. Gold Properties.

Assays have been received of a number of samples taken from the Proserpine Mountain Gold prospects near Barkerville, B. C., which are promising. These were looked forward to with interest by the owners as they came from the sulphide, about 13 feet beneath any sign of surface oxidation. The returns follow:

No. 1: From south side of shaft, 9 feet 6 inches across ledge, $18.10.

No. 2: Across 12 feet no north side of shaft, $22.70.

No. 3: A continuation of No. 1 across three feet of schist outside of the vein, $7.70.

No. 4: A selected sample of mineralized schist from a seam in ledge, $9.70.

No. 5: A sample of galena, no sulphide visible, gold, 80 cents, silver $25.70, lead 51%.

No. 6: Taken from bottom of shaft, about 95% of silica, carrying approximately 5% of steel-grey fine grained sulphide. Several miners who are familiar with this kind of ore have pronounced it telluride. This sample gave a return of $184.80 in gold and $3.20 in silver perton.

No. 7: A sample of oxidized ore from near the surface, $165.20.

The owners are not sure whether part of the values come from the silver or whether altogether from the sulphide. If the entire values were contained in the latter it would indicate a very rich sulphide, or a telluride ore. Interest is lent to this discovery by the fact that a number of years ago John Brodie, an old time Cripple Creek Miner, discovered several pieces of rich telluride float in the vicinity and spent several years prospecting for the mother lode, without success.

Considerable of this rich sulphide was noticed by these prospectors at the bottom of their shaft, especially in the rock fractures, but not knowing its value little attention was paid to it. If this proves to be telluride ore it will mean much to the owners as well as to the district generally.

The above samples average up well with those taken by a government engineer higher up the shaft. In order to avoid deceiving themselves the owners employed an outsider — an experienced prospector — to do the sampling.

May Close Merritt Collieries.

The immediate future of the coal industry at Merritt, B. C., is reported to be uncertain. For some time the Canadian Pacific Railway company has been taking a considerable proportion of the output of that field for steaming purposes, a use to which the coal is well adapted. Recently it has been necessary, according to the operators, to increase the selling price because of the demands of men for more wages and the generally high cost of production. The company, apparently, does not care to pay at the higher rate and has cancelled its contract. If some arrangement cannot be made to continue the former business relations it is predicted that the colleries affected either will be forced to close down or to materially curtail their output. The Hon. Wm. Sloan, Minister of Mines, has been asked to assist in the effort to reach an adjustment of the difficulty to which he has acquiesced, but whether the representations which have been made through him, as well as from other sources, will be effective is doubtful at the present moment.

"Bob" Griffith, a veteran Alaska "musher," with a heavy armed guard and two dog teams, arrived at Seward, Alaska, recently with $400,000 worth of gold dust from the Iditarod for shipment to Seattle.

Hoisting Machinery

BUILT TO SUIT YOU AND YOUR NEEDS

We offer you STEAM DRIVEN HOISTS, with Boiler, or without Boiler, ELECTRIC DRIVEN HOISTS, BELT DRIVEN HOISTS,

In any of the following sizes:

10	Horse	Power,	to	Lift	2,600 lbs.
15	"	"	"	.....	4,000 "
20	"	"	"	.....	5.500 "
25	"	"	"	.....	7,000 "
32	"	"	"	.....	8,000 "
40	"	"	"	.....	10,000 "
50	"	"	"	.....	12,500 "

We also offer you any diameter of Drum up to 48", to give you the Hoisting Speed you desire.

FOR SALE—TWO CLAIMS

Adjoining Hattie Gold Mines in Coulson, Beatty Area
Would give Working Option to responsible parties

H. C. CROW, 184 Sunnyside Ave., TORONTO

Mr. A. I. Fisher, member of the British Columbia Legislative Assembly for Fernie District, delivered an address in the House recently deploring the waste existent in the Crowsnest Pass Coal Fields in the manufacture of coke. He declared that it was a pity that the by-products of the coal continued to be driven off into the air by the use of the obsolete bee-hive ovens. It was only a matter of chemistry, he declared, and the application of such measures as could be defined by experts which would permit British Columbia to profit by the manufacture of many commodities which, in pre-war days, were held as monopolies by other countries.

Electric Smelter for Seattle.

The announcement that the Smelters Steel Co. has decided to install electric furnaces for the smelting of British Columbia iron ores on the commercial waterway near Seattle, Wn., has been received with special interest in this province because of the efforts being made to interest capital in such an industry on the Canadian side. Whether the company will proceed with such an installation for the treatment of British Columbia ores in view of the provincial tax of 37½ cents per net ton of ore mined is considered doubtful. It will be recalled that the B. C. Government, in furtherance of its desire to see the industry initiated in the province, has offered a bounty of $3.00 per net ton of pig iron manufactured from local ores and $1.50 per net ton of pig iron produced from foreign ores. This, it is considered, is a satisfactory recompense, where the iron is made in British Columbia, the bounty being substantially above the tax. However, it is said that the Smelters Steel Company proposes installing four electric furnaces, with a total capacity of 30 tons of output in high grade gray iron per day. The furnaces are to be of the arc type with one electrode to each furnace. The company is reported to have abundance of the flux necessary for smelting purposes near its mines.

According to information received, the management of the Northport Smelter contemplate an indefinite closing of the plant.

P. M. CHRISTOPHER ELECTED PRESIDENT, DISTRICT 18, U.M.W.A.

Announcement has been made of the result of the election of officers to the Mineworkers' Union, District 18, U.M.W. of A., which include Eastern British Columbia and the Province of Alberta. P. M. Christopher, Blairmore, has defeated David Rees, of Vancouver, B.C., by a majority of 1486 for the presidency. Alexander McFegan, of Brule, Alberta, defeated William Dickenson, of Fernie, B.C., by 1,100 for the vice-presidency. G. Christie, Bellevue, was elected over William Potter, of Fernie, by 528 for the position of auditor. A second election had to be held before the offices indicated were filled, as the constitution requires that every officer must have over 50 per cent of the votes cast and, in each case originally, there were more than two candidates in the field. The names of other officer holders follow: Secretary-Treasurer, Edward Browne, Taber, Alta.; International Board Member, Robert Livett, Bellevue, Alta.; Tellers, W. Patterson, Blairmore; Patrick Conway, Brule; and William Hayson, Coleman, Alta.; Delegate to Dominion Trades & Labor Congress, Frank Wheatley, Bankhead, Alta.; Delegate to Alberta Federation of Labor, A. Cocchioni, Wayne, Alta.; District Executive Board, Frank Brindley, Fernie, B.C.; John Brooks, Bellevue, Alta.; Charles Peacock, Lethbridge, Alta.; Frank Wheatley, Bankhead, Alta.; John Kent, Wayne, Alta.; and David Fraser, Brule, Alta. The installation of these officers will take place on March 1, probably at the conclusion of the Annual District Convention. The newly elected officers will be charged with the conduct of negotiations for the renewal of the working agreement with the Western Coal Operators' Association, which agreement expires on March 31 next.

NEW HAZELTON GOLD-COBALT MINE.

The property of the New Hazelton Gold-Cobalt Mines, Limited, which is situated on the west side of the Rocher de Boule Mountain, and close to the line of the Grand Trunk Pacific Ry. Co., gives promise of developing into a producer of importance. Returns have been received on a carload of gold-cobalt-molybdenite ore which was shipped last August to the government ore testing plant at Ottawa. They show considerable values in the three minerals mentioned as well as some in nickel and arsenic, the gross values of the 26 tons, based on molybdenite at $1 per lb., cobalt at the same, nickel at 50 cents, arsenic at 5 cents and gold at $20 being placed at $2,399.45. This company some months ago shipped 28 tons of its ore to the Anyox, B.C. smelter, which gave returns of $1,090.00 in gold, or $53 net to the ton in gold alone after payment of railway and smelter charges. As there is no means at Anyox for saving other values, no return was given on other content. The opening up of the property is proceeding, work now being under way on copper veins as well as on the rich gold-cobalt vein. Fifty sacks of the latter ore are said to be ready for shipment, which is being constantly added to with a view to its being forwarded for treatment in the spring.

B. C. Government Engineers May Examine Metalliferous Mine or Works.

Mining engineers in the employ of the Government of British Columbia, of whom there are six, each having charge of one of the mineral districts into which the Province has been divided, are to be given authority to make examination of any metalliferous mine, reduction works, or concentrating plant of the Province. Non-compliance entails a fine of from $10 to $500. It is not suggested that the engineers have received anything but the most courteous treatment from the mine and smelter operators, but Hon. Wm. Sloan, Minister of Mines, proposes that the engineers shall be provided for the fullest legislative authority in the carrying out of the responsible duties of their offices.

INTERNATIONAL MINING CONVENTION

VANCOUVER, B.C.

March 17, 18 & 19

Under auspices of British Columbia Chamber of Mines, Leaders of Mining World in Canada and the United States will take active part in the proceedings.

Most comprehensive display of ores and up-to-date mining machinery ever seen in Canada.

Everyone interested in mining operations should arrange to visit Vancouver next month.

Write for full particulars to

JOHN D. KEARNS, Manager,
Rogers Building, Vancouver, B. C.

In the last month the Rossland mines have been adding quite a number of men to their working forces.

The estimated quantity of iron ore mined in the United States in 1918 amounted to 69,712,000 gross tons, compared with 75,288,851 tons in 1917, a decrease of 7.4 per cent. The estimated shipments of ore from the mines in 1918 were 72,192,000 gross tons, valued at $246,043,000, compared with 75,573,207 tons, valued at $238,260,444 in 1917, a decrease in quantity of 4.5 per cent but an increase in value of 3.3 per cent. The average selling value of the ore per gross ton at the mines for the whole United States in 1918 was $3.41, compared with $3.15 in 1917.

About 86 per cent of the iron ore mined and shipped in 1918 came from the Lake Superior district, in which about 60,092,000 gross tons were mined and about 62,285,000 tons were shipped in 1918, compared with 63,666,068 tons mined and 63,854,752 tons shipped in 1917, representing decreases of 5.6 per cent and 2.5 per cent, respectively, in 1918. The average selling price of iron ore at the mines in the Lake Superior district in 1918 was $3.50 a ton compared with $3.28 a ton in 1917. The quantity mined in the States in this district—Michigan, Minnesota, and Wisconsin—showed a decrease and the quantity shipped in Minnesota and Wisconsin showed a decrease, but the shipments from Michigan apparently increased slightly. The decrease in the quantity mined in the Lake Superior district, about 3,574,000 tons, was partly made up from stocks, which were evidently depleted to the extent of about 2,202,000 tons in 1918.

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $5 an acre for SUPERIOR METALS, and $3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

SHEBROOKE, QUEBEC

New Copper Wage Scale.

Boston—A new minimum basis of 18 cents a pound will be adopted by the copper industry as a basis for wages to be paid the mine workers. Word to this effect will be conveyed to the various copper camps as a result of conferences among producers, government officials and labor representatives.

The sliding scales of the several districts throughout the country will be resumed as a basis for paying the mine workers, but should the metal drop below 18 cents a pound the wages will not be affected. Any excess in price over that figure will produce a higher wage.

The 18-cent minimum will provide for payment in the larger camps as follows:

Camp	Day
Butte	$4.75
Clifton	4.00
Globe	4.90
Miami	4.90
Jerome	4.90
Bisbee	5.00

The reduction from current wages will average $1 per day should the immediate adoption of the minimum wage be found necessary.

No specified period will be covered by the mining companies in promulgating the notice of an 18-cent minimum.

The January wages were all paid on the basis of war time conditions and 32-cent copper. The current month has witnessed small sales only on a downward tendency to 18½ cents a pound. Just what the February scale will be must depend on copper prices yet to be made.

(Continued from page 125.)

"Last season the French Company secured an additional bond guarantee of $25,000. This sum, he estimated, if the company were granted an amendment to the Act which would enable him to finance the purchase of ore through a bank, would have enabled him to demonstrate the commercial possibilities of the process. It was his plan, he stated, to follow the usual smelting practice of borrowing money against metals on hand and awaiting sale in the market. In this way ore could be purchased and the plant operated directly it had got underway. The $25,000 issue was guaranteed, but the amendment to enable borrowing against metal stock on hand was not made and Mr. French learned recently that the government had deducted an amount of $6,131 from the $25,000 and employed it to pay interest on the $40,000 for three years to December 1st last. There was much delay in making the second issue available, which further increased expenses. None of the $25,000 was received by the French Company until November 6. The original Act states that the province guaranteed the interest and agreed to pay it out of consolidated revenue fund. The intention was that the company should get the full amount of the bond issue. It did so in the case of the $40,000 but has been credited with only between $18,000 and $19,000 of the issue guaranteed last year.

"Mr. French is now asking that the government rescind its action of deducting the $6,131 from the $25,000 issue. If that is done the amount still available for the use of the company, and which Mr. French believes will be sufficient to enable it to demonstrate its process, will be nearly $11,000. Hence the company has actually spent only about $14,000 of the $25,000 bond issue guaranteed by the Province last year."

Oxy-Acetylene Welding and Cutting

Prest-O-Lite Operator Repairing an Expensive Casting at Trifling Cost.

Prest-O-Lite Welding Saves Replacements.

The Prest-O-Lite Process of Oxy-Acetylene welding is daily opening up new possibilities for economy and efficiency in the factories, mills, railroads, mines and machine shops of Canada.

For repair work, as well as for manufacturing, it is saving time and money in thousands of plants. Valuable time is saved through one Prest-O-Lite repair. Important machinery, machine parts and tools are saved from the scrap pile, and expensive replacements are frequently avoided.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

THE GOLD MINES.

The interpretation of the recent report by Lord Inchape, head of the British Commission, which made what is considered to be a complete survey of the status of gold, is considered here as pointing toward the fact that this country is looked to as a factor that will prevent too great a decrease in the output of gold in the British Empire. That Porcupine and Kirkland Lake, as well as Boston Creek will at least do their share is already evident. The big way in which preparations are being made to carry on operations during the coming summer, appears to assure a greater production for 1919 than any previous record in the history of gold mining in Ontario. By the beginning of 1920 the standing of the yellow metal industry of this country will probably be an agreeable surprise for those not in direct contact with those directing mining operations, and in possession of facts concerning the big plans for the very early future.

ANNUAL MEETING CANADIAN MINING INSTITUTE

The 21st annual general meeting, to be held at the Windsor Hotel, Montreal, on March 5th-7th, 1919, should be very interesting to those who attend. During the war the meetings have been held regularly and have proven useful because the interchange of ideas was more than ever necessary, and because encouragement and inspiration for those facing many difficult problems resulted from the "getting together." The Institute is now faced with other problems that demand serious consideration; but most of those who attend the meeting this year may do so with lighter hearts.

During one short year depression, which was the natural result of the conditions at the front, has given place to the joy of a victory greater than any dared hope for. Some of our victorious army are home after years overseas. The Institute will give these men a suitable welcome. Not until the next meeting can we have a real reunion however, for the greater part of the Canadian army is still overseas.

It is very fitting that the Canadian Mining Institute should this year extend to members of the American Institute of Mining and Metallurgical Engineers an invitation to attend this meeting in Montreal. To the Americans the Allies owe no small share of the victory, and none will be more ready to acknowledge it than Canadian mining engineers.

"NO GERMAN NEED APPLY".

Mr. H. V. Winchell, president of the American Institute of Mining and Metallurgical Engineers, speaking at the New York Meeting, commented on the treatment that prospectors from other countries receive in Canada. He pointed out that the United States mining rights are granted only to citizens or those who have declared their intention to become such. In Canada the right to develop minerals is open to all, whether British subjects or not.

Mr. T. W. Gibson corroborated the statements of Mr. Winchell, but in doing so made it clear that no alien enemy is entitled to such rights in Canada. Germans and other alien enemies will receive no mining licenses in this country. An endeavor should be made to see that they do not acquire rights in indirect ways.

LABOR AND CAPITAL.

There have always been discussions on the subject of 'labor and capital', and probably always will be. It is doubtful whether, in modern times at least, there has ever been such general interest in the discussion as at present. Even before the war there was a feeling that a storm was brewing in industry. There was not only dissatisfaction on the part of the employees, but there was a feeling on the part of the employers that there was reason for discontent. There was a good deal of doubt, however, as to what was the real reason for such discontent, and unreadiness to believe that it could be removed simply by increase in wages.

Throughout the period of the war there has been a rapidly growing idea that the real ground for discontent is that in our industries we are not truly democratic. There has been a tendency to degrade labor by making it uninteresting. The incentive to work has been to too great an extent measured only by the things that can be bought with the wages. The workman has not had a normal interest in his work. The removal of this cause of discontent is a task in which leaders of capital and labor can well join forces.

The problem and an outline of a scheme for solving it has been admirably pointed out by Mr. C. V. Corless, At the recent meeting of the American Institute of Mining and Metallurgical Engineers, Mr. Corless in an excellent, earnest address urged leaders in industry to

take up the problems with their employees. At the meeting of the Canadian Mining Institute this week there will be discussion of the subject.

In bringing this subject to the serious attention of the people, the Canadian Mining Institute, through Mr. Corless, has played a leading part. We trust that the discussions this week will show that the Institute is behind Mr. Corless and that it is not too far behind to be effective.

ITALY UTILIZES VOLCANIC POWER.

The present enormous price of coal in Italy, according to the Italian Bureau of Public Information, has resulted in the realization of an idea which at first thought seemed but a dream, but which instead has been developed in a marvelous manner, and is assuming quite considerable importance; this is the industrial exploitation of one of the features of vulcanism and that is the natural heat emitted from the soil in those regions more or less volcanic in character.

The first experiments along this line were made some years before the war by Prince Ginori-Conti in Tuscany at Larderello, near the salt mines of Volterra, a region extensively covered with volcanic formations, the most wonderful being the so-called "soffioni," which are certain volcanic vents emitting powerful jets of very hot steam containing boric salts and various gases used in the extraction of boracic acid. Instead of limiting the use of these steam-jets, as in the past, to extracting the salts contained in the exhalations of these natural vapor-vents, the ejection of the steam is stimulated by boring holes. In this way it is possible to obtain powerful jets at a pressure of two to three atmospheres, according to the locality, and in some exceptional instances as high as five atmospheres, the temperatures varying from 150 to 165 degrees Centigrade. These jets maintain their force and temperature unchanged for many years, and they are not affected even when other openings, not too near each other, are bored in the ground, proving that they do not influence each other reciprocally, so great is the underlying thermic energy below. In 1905, Prince Ginori-Conti applied this natural steam to a 40 H.P. engine, using only a small section of the Nenella fissure, which is the most powerful "soffione," the steam ejected having a pressure of five atmospheres.

The results obtained during several years of experimentation were satisfactory, so that he continued to make larger and deeper borings, measuring the force of the steam ejected; combined, this force could operate engines of many thousand horsepower.

In 1912 an experiment was made, very wisely on a more modest scale, but sufficient to obtain conclusive results, for which a 300 H.P. turbine-alternator was used.

Later, because of the enormous increase in the price of coal, the Prince decided to exploit the thermic energy of these soffioni on a much larger scale, but as other substances are emitted with the steam, among them sulphuric acid, which corrodes metals, particularly iron and therefore the pipes in which the steam was to be collected, he attempted to use this steam only for heating. Three turbine-alternators of 3,000 kilowatts each were installed, fed by boilers at low pressure not heated by coal or other combustible fuel, but by the natural steam, superheated to 165° C., issuing from these soffioni and piped and carried to the boilers.

To-day the works at Larderello have a central plant of 16,000 H.P., operating without interruption and distributing current to Florence, Livorno and Grosseto; its capacity is soon to be increased.

Here we have a new and oriignal utilization of Italy's natural wealth; current is generated not by the use of "white coal" (water-power), but by means of heat energy of volcanic origin.

As the natural steam available at Larderello and the surrounding country is, one might say, unlimited and depends upon the number of bore-holes made in the boraciferous soil, the great possibilities for further development are readily seen.

WOULD DEPORT ALL ENEMY ALIENS.

That all enemy aliens should be deported from Canada, and that the Canadian Government should be careful to retain full control of immigration to the Dominion, whatever other concessions may be granted at the Peace Conference, were the two chief points of the resolution unanimously adopted by the Legislature of British Columbia recently. The debate on this subject was of special interest to the coal miners and the workers of all industrial sections of British Columbia, but it was followed with particular keenness by the miners of Vancouver Island Coal Areas, because the employment of aliens in the mines has for years been resented by the English speaking classes of these sections. Hon. Wm. Sloan, Minister of Mines, who is the representative of the latter districts in the House, spoke strongly on their behalf, supporting the proposal that the Dominion Government should be asked to deport all enemy aliens and moving an amendment to the effect that "Canada's representatives at the Peace Conference be asked to adhere firmly to the principle that Canada shall always exercise full control over immigration to the Dominion." He not only wanted aliens put out of the country, but wished to be sure that, once out, they would be kept out. This was a matter, he said, of primary interest to his constituents. The coal miners of the Island, and in fact of the whole of the Province, had furnished considerable quotas to the Canadian Army. Their war record, as to fighting men provided and in every other respect, was one of which they were proud. Now those who had gone were coming back to find, in many instances, that while they fought for their country at $1.10 a day, aliens had been filling their places at home at high rates of pay. Their demand was that all enemy aliens should be returned whence they came, and their places filled by returned soldiers as far as possible, and where not possible by British subjects. Recent statements indicated that the whole question of immigration was to be discussed at the Peace Conference. It was possible that, at such an international conference, a disposition was developed on the part of some delegates to make concessions. He felt that Canada should not give way in the slightest on the principle that her Government control the character of the tide of immigration which was bound to flow from the mixed populations of Europe and Asia.

Correspondence

The Leasehold System.

To the Editor of the Canadian Mining Journal:

Sir,—It would be futile to deny that the leasehold system as applied in Australia to the mineral lands, have proven a great success there. But if you expect a success for that system in Canada, you must also introduce the referendum and recall in the Dominion and Provincial Governments. That is the very thing that makes for success in Australia, and the lack of which spells failure whenever leasehold is applied in Canada.

May I call your attention to the fact that all mining lands in the Gowganda and portions of the Montreal River and Sudbury Mining Divisions can be acquired only under the leasehold system. Prospecting and staking can only be done under the authority of a special permit issued by the Department for a consideration, and no work on claims staked may be performed without a written permit from the Department.

As the first prospecting and staking for silver within the Gowganda began in 1907, and as staking has been carried on more or less continuously, I think it is fair to claim that the leasehold system as applied under Canadian system of Government, have been given a fair trial.

Some of us who have seen the population of the camp dwindle from some thousands in 1908-09 to the at present probable three hundred. We have seen a town represented by all lines of business, including three banks, seven hotels, a dozen stores, several assay offices, post office and mining recording office, dwindle to as at present, one assay office, post office, two stores, three hotels. We have seen the country surrounding Gowkanda alive with prospectors, miners and representatives of mining companies busy trenching, building camps, bringing in and putting up machinery, everyone feeling elated over the promising possibilities of their different holdings. To-day we have four or five working properties, deserted and tumbled down camps, rotten camp equipment and tools, useless machinery, in all representing several hundred thousand dollars in capital and labor lost and destroyed.

Every year has brought increased destruction to the forest by fires, until to-day it is almost impossible to travel through the area owing to dead and fallen timber.

Is there anyone, who dare say that the leasehold system as applied to Gowganda, has proven beneficial.

That the desertion of the camp was not due to lack of confidence in its mining lands, is attested by the unusual number of leased claims held in the camp.

When in 1911 the operators and others entrusted in the development of this section, called on the Government for the assistance that they felt entitled to receive, we were advised that the Government's policy was to protect its forest reserves rather than to encourage further prospectors, miners or railroads. The result of this was two-fold: Large numbers owning leased claims left the camp, others stayed and secured a lease, then left, their equipment going to waste; everyone interested in the development of the camp saw in every green bush an enemy to be destroyed, and the increasingly large areas of burnt country shows the result. Had mining been encouraged, dead timber would have been cut and used and a revenue derived therefrom. Also, the removal of dead timber would have proved a great factor in saving other green areas.

Therefore the Government's policy had proved destructive to both mining and forestry and given a black eye to the leasehold system which is apparently known by the people of Manitoba.

These conditions, as described existing in Ontario, could not exist anywhere under the Australian form of Government.

Of course, one mine has been able to carry on continuously and develope an enormous body of ore, besides being a continuous shipper. But it is well known in this section, that at several times during the first five years of its operation the engineer in charge advised closing down. He was overruled by the owner, whose capital and insistance to carry on have brought its well earned reward.

Investors who lost money at Gowganda blame the mining industry for the loss. The Government blames the industry for the destruction of the forests. But, as I have shown, the responsibility for both rests squarely on the shoulders of the Government.

Yours, etc.,

L. O. HEDLUND.

Gowganda, February 15th, 1919.

MINING NEWS FROM THE PAS.

The Pas, Feb. 14.—The Cameron-McKay group of eight claims on the east arm of Athapapnskow lake are being developed. Messrs. McKay and McFarland, of Regina, and nine men, went north last week with a full camp equipment. The showings on these claims are considered promising, and warrant vigorous investigation. A dyke of 42 to 70 feet wide has been located. Strong indications of copper sulphides are present.

Morgan has 175 teams hauling copper ore from the Mandy mine. The amount hauled is stated to be 6,000 tons so far.

Monday's Tamarack took a small body of prospectors to Hudson Bay Junction, to stake claims for oil and gas. Frank Moore says the indications are strong and samples of shale have shown high contents of oil. The place is about 80 miles south of The Pas.

The mining recording office remains in The Pas, and great satisfaction is felt everywhere. Mining Recorder F. Barker was so advised on Wednesday. It was intended to remove this office to Dauphin, but upon representations of The Pas Board of Trade, J. A. Campbell, M.P., Mayor Finger, Professor Wallace, Mandy Mining Company, J. W. Callinan and many others, the intention was abandoned. The office now remains here in the centre of mining.

The advice of Mr. Barker was that The Pas will remain a full mining recording office, with all books and documents retained here, and in this way things will go on as before. The rearrangement, therefore, makes The Pas a sub-agency for lands, and a full agency for mining claims and matters connected thereto.

To bring this desirable end about, it was necessary for all interests in the Northland to unite, as they did, and protest vigorously against removing the office. The Board of Trade took the lead, and the success of the movement establishes the board's right to command the interest and support of all. Telegrams of thanks were sent to Hon. Mr. Meighen. — The Pas Herald.

Instruction by Correspondence for Miners

Arrangements have been made by Hon. Wm. Sloan, Minister of Mines, and Hon. Dr. MacLean, Minister of Education, for the establishment of a system of instruction by means of correspondence which will give all miners who are British subjects and resident in British Columbia an opportunity to qualify for positions of trust and responsibility in connection with their chosen vocation.

In making this announcement it is pointed out that for some years the Department of Education has been conducting night schools for the benefit of men engaged in the mining industry with a view to providing that instruction which is necessary for thorough preparation for the examinations set by the Department of Mines for those aspiring to important charges in connection with the operation of mines.

The conditions of the shift system under which miners work heretofore has mitigated against that pronounced success which is so much desired by both the Mines and Education Departments and, in order to overcome this difficulty and to bring the opportunities of study within reach of a greater number of men the decision has been reached to conduct the classes and disseminate the required knowledge through the medium of correspondence. It is considered as probable, although no definite statement has been authorized as yet, that the correspondence will be augmented by personal visits on the part of instructors to the various sections of the Province for the purpose of giving at intervals such guidance and assistance to students as, perhaps, may not readily be obtained through the mail.

It is explained that, not only will those subjects be covered in which a mastery is necessary before British Columbia papers as shotlighters, overmen and mine-managers can be obtained, but a preparatory course also will be given. As the examinations referred to, which are conducted by the Mines Department, are only open to men not less than twenty-three years of age, it is proposed to provide means of study for youths between the ages of 14 and 23. If the years intervening between the time of attendance at day-school and the time when the young man is eligible to sit for his first test be wisely spent, the faculty for acquiring knowledge will be prevented from becoming dulled, the receptivity of mind being preserved. This, it is considered, will furnish the opportunity by which boys fresh from school may persistently and patiently pursue those studies which will lead them successfully to the final examinations.

It is felt that this change in the present system will be generally appreciated, having the effect of placing within the convenient reach of everyone interested the means of securing that training necessary for advancement. That the young men who take advantage of the course will be well rewarded is assured, as there is no question as to the benefits of the study-habit inculcated during adolescence and matured in adult manhood.

It is interesting, in this connection, to outline some of the courses proposed. Those of most importance are prescribed for the first year (preparatory), and fourth, fifth and sixth years. They follow:

First Year.

Preparatory work for boys and young men over fourteen years of age. Pupils should have a pair of compasses, a pair of dividers, a protractor, two set-squares, a T-square, and accurate ruler graduated in inches and centimetres.

Arithmetic—Vulgar and decimal fractions; short methods of obtaining approximations; practical applications; square root; proportion, simple and compound; proportion expressed in a form of simple equation.

Mensuration—Measurement of lines; scales; use of compasses, dividers, set-squares, T-square; areas—rectangular, triangular, and circular areas; area of eclipse.

Drawing—Meaning of plan, elevation, section. Type-models—prism, cube, etc., to be draughted, and cut out of stout paper; plans, elevations, and sections to be drawn from them.

English—Penmanship; spelling; grammatical errors; letter-writing; personal and business composition; simple descriptions and narration relating to mines and mine operating; encouragement of home-reading.

Text-books—The Black Diamond Reader (Nelson) (a primer of coal-mining); the Fifth Reader; Arithmetic, Book III. (Milne); Drawing Book IVa. Books to be obtained from the Free Text-book Department on application.

These books should not be taken from the school-room, but may be purchased from the teacher. Fifth Reader, 50 cents; Third Arithmetic, 45 cents.

Fourth Year.

Course for the Fireboss, Shiftboss, or Shotlighter's Certificate (Third Class.)

Candidates must have at least three years' practical experience, be at least twenty-three years of age, and hold a First-aid Certificate.

Mining Arithmetic—First four rules of arithmetic; vulgar fractions; decimal system of notation; decimal fractions; percentage and simple interest; square root; simple ratio; proportion and variation.

Drawing—Scales; measurement of simple figures; the triangle; square and rectangle.

Metric System—Measurements by metric scales; simple tables of British and metric units.

Mensuration—Area of regular figures; the triangle, square, circle, and ellipse; area of irregular figures by Simpson's Rule; squared paper, use of squared paper, some simple graphs, and their practical applications.

Gases—Practical instruction in the properties of mine gases and in the means of their detection.

Theory of Mining—Composition of air; determination of the volume of the residual gas after removal of the oxygen by phosphorus; properties of the residual gas; preparation and properties of the following gases; oxygen, nitrogen, hydrogen, marsh-gas, hydrogen sulphide, carbon dioxide, and carbon monoxide; explosive mixture of fire-damp and of hydrogen with air and with oxygen; the effects on the intensity of the explosion due to increasing the percentage of either gas; experiments on the passage of flame through long glass tubes of various diameters; the propagation of the explosive wave; circumstances under which the several noxious gases are met with in mines; means of detection and removal; gaseous diffusion; its importance to the miner; atmospheric pressure; the barometer effects of changes of atmospheric pressure on the issue of noxious gases in mines; observations of the flame "caps" produced on several types of safety-lamps by known percentages of fire-damp; testing for carbon monoxide with the Simonis apparatus; blood test for carbon mon-

oxide; practical lessons in the measurement of an air-current by means of the anemometer; coal-dust, danger of; experiments with Vital's apparatus; shot-firing; mining explosives; duties and responsibilities of a mine fireman; how to make a report of an inspection.

The "Mining Act" and rules of the mine.

Fifth Year.

Course of Work for the Overman's Certificate (Second Class.)

Conditions.—Have at least five years' practical experience; be at least twenty-three years of age; hold a First-aid Certificate.

Shaft-sinking—Drainage; tests, theories, ventilation; principles of the fans; duplicate and auxiliary fans.

Colliery Explosions— Historical review; coal-dust; rescue-work and apparatus; methods of testing fire-damp; removal of accumulation.

Lighting—Safety-lamps, various types; cleaning, lighting, locking and relighting; flame and electric; handling and examining; regulations regarding safety-lamps.

Methods of Working—Shaft pillars, laying out; positions, number, inclination of main roads, pillar and stall; long-wall methods, working of various seams, roof-control, supports, boring, shot-firing, ventilation; distribution and control of air.

Transmission of Power—By steam, disadvantages of steam, steam-pipes, traps, expansive joints, condensers and condensation; by compressed air; by electricity, hydraulic power, the oil-engine; mechanical haulage.

Technical Electricity and its Uses for Safety—Properties of magnets, magnetic induction; lines of force, electrical currents, electric magnets, electric bells electrolysis, current measurement, Ohm's Law; measurement of resistance; Wheatstone's bridge; ammeters; voltmeters; wattmeters; direct currents; wiring circuits; dynamos and motors; alternating currents; the "Mining Act" and rules of the mine; duties of the various men.

Mathematical Calculations—Mining formulae; logarithms; use of squared paper, trigonometry.

Sixth Year.

Cover-Work for Mine Manager's Certificate (First Class.)

Conditions.—Be a British subject; have at least five years' practical experience; be at least twenty-five years of age; hold a First-aid Certificate.

Geology of Coal—Origin, varieties, stratified rocks, outcrop; strike and dip of bed; igneous rocks; coal-beds and mineral veins, rolls; faults; rules for finding continuation of seam beyond faults; cleavage of rock; cleat; lype, and reed of coal.

Shaft-sinking—Drifts, slopes, and shafts; surface arrangements; supplies, precautions, timbering; Kind-Chaudron method and modifications; Pattberg and hydraulic methods; sinking through running ground by piling and spiling; Caisson sinking; Triger's and Poetsch's methods.

Methods of Working Coal.—Laying out pit-bottoms; size of shaft pillar; direction of main roads; tools and appliances used underground; boring and drilling machines; pick and undercutting machines; power used; considerations of thickness and inclination of seam; liability to spontaneous combustion; faults; conditions of roof; depth of working; supporting excavations, effect of thrust and creep; methods of timbering.

Hoisting and Haulage—Geared hoisting-engines; direct- and alternating-current hoists; ropes; size of engine for output; engine foundations and specifications; hoist indicators; drums and reels, rope wheels and fastenings; clutches; brakes; sheaves; skips and cages; buckets; car-locks; car-guides; landing-fans; head-frame; signalling.

Mine Drainage—Surface and underground drainage; fault and inclined deposits above and below water-level; tapping and draining abandoned workings; mine-dams; siphons; water-hoisting; hoisting *versus* pumping water.

Ventilation, Theory, and Practice—Properties of gases; behaviour and detection of mine gases; fire-damp, after-damp, ignition of gases; mine explosions; prevention of explosions; brushing gas out of pockets and old workings; sealing off fires; precautions in approaching old workings; form and size of airways for ventilation; measuring velocity of air and ventilating pressure; natural ventilation, furnace ventilation, types of fans, fan-installation doors; principles of fan design; fans of the propeller type; secondary ventilation, installation of auxiliary fans; regulators, brattice, air-crossings, stoppings, air-splitting.

Lighting—Lighting of pit-bottom; naked lights; forms of safety-lamps; cleaning, lighting, locking, and relighting; flame and electric lamps; fire-damp indicators; regulations regarding safety-lamps.

Surveying—Practical geometry and trigonometry, properties of angles, triangles, and common plane figures, logarithms, areas, construction and reading of verniers; surveying with chain alone; construction, adjustment, and proper use of compass, level, transit, etc.; surveying with the transit, forms and field-notes, levelling; connection of surface with underground surveys; putting on lights; methods of keeping underground notes.

Mechanics—Definitions and illustrations of force, mass, weight, motion, kinetic and potential energy, momentum, equilibrium, centrifugal force, law of conservation of energy; forms of energy, representation of forces, levers, transmission of power by pulleys and belts; by rope drive; laws of friction, co-efficient of friction; steam and compressed air.

Boilers—Various types, Cornish, Lancashire, and Galloway; water-tube boilers, Babcock and Wilcox, Heine, Stirling; boiler construction and testing.

Steam-engine—Properties of steam; types of valves; operation and care of engine; steam connections; condensers.

Air-compressors—Construction of air-cylinders, pistons, and valves; single and duplex, simple and compound compressors; isothermal and adiabatic laws; energy losses; Rearell's hot transmission system; compressed-air locomotives; compressed-air drills and coal-cutters.

Pumps—Simple hydraulics, static head, calculation of flow of liquid through pipes; siphon; types of pumps, calculation of horse-power; setting up pumps; packing; priming; their operation and care.

Electricity—Relative advantages of direct and alternating current for mining purposes; mining switch-gear; transformers and transformer stations; voltage regulations; load diagrams; application of electric power to machine-driving in mines; specifications of mining motors; rating; plate and other protection; upkeep of electrical plant; electric winding, Siemens-Ilgner and Westinghouse systems.

Preparation of Coke—Suitable coals; principles involved in coking; coke-making in bee-hive and retort ovens; nature of by-products and their recovery.

Laws relating to coal-mining in British Columbia.

Market Conditions

A Recently Issued Statement of the N. S. Bureau of Mines Contains the Following Comments on Market Conditions:

Pyrite and Sulphur.

The pyrite and sulphur industries of the United States are now in a transition stage from a war to a peace basis, and as a result there is considerable dislocation of the industry, owing primarily to the uncertainties of the markets, and the prices that may prevail. The cessation of hostilities and the abrogation of war contracts found the large consumers of pyrite and sulphur with large reserves on hand, and naturally, until these reserves are absorbed the demand for new material will be greatly curtailed.

Another consideration is that many of the acid manufacturers, especially those engaged in the manufacture of fertilizers, are not anxious, at this time, to enter into any new contracts for either pyrite or sulphur, anticipating that the present prices of these products will be materially lower in the course of the next few months.

The high rates of 35 to 40 shillings per ton on Spanish pyrite, which prevailed during 1918, have been substantially reduced since the close of the war, and recently rates as low as 20 shillings per ton have been quoted. The pre-war rates ranged from 8 to 10 shillings, but it is not likely that these low rates will again prevail for some time to come.

During 1918, the price of imported pyrite delivered at Atlantic ports varied widely, depending largely on ocean rates. The prices varied from 25 to 35 cents per unit of sulphur, with an average of perhaps 30 cents. A recent quotation at New York is 16½ cents per unit, on the basis of a 10 shilling ocean freight.

Graphite.

The U. S. War Trade Board has removed all restrictions on graphite importations, notwithstanding the recommendation of the Director of the Bureau of Mines to continue them until July, 1919. The French Government has authorized the export of 1,500 tons of graphite from Madagascar to the United States during the first half of 1919. Some weeks ago 1,000 to 1,500 tons was offered f.o.b. Madagascar at 5½ cents per pound. Large stocks exist in France.

Copper.

There appear to be considerable stocks of both refined and blister copper. There is no free market for the metal, the price fixed by the United States Government being no longer operative and selling conditions are consequently unstable. There was recently announced the personnel of a commission which proposed going abroad for the purpose of surveying the foreign copper market and if possible negotiating sales. This commission is composed of men representing the large producers.

Since the signing of the armistice curtailment of production by all the large mines has been in order and recent reports are to the effect that Anaconda is running at a 40 per cent curtailment. The position of Anaconda is a pretty good barometer of the other large domestic producers. The cost of producing copper has risen materially in the past eighteen months owing to the increase in wages and supplies, decreased efficiency of the men, and general disorganization arising out of war conditions.

Magnesite.

The United States production of magnesite prior to 1915 (back to 1909), amounted annually to about 10,000 short tons. The domestic production in California greatly increased with the cutting off of supplies from abroad which came principally from Austria and Greece. Washington began to produce late in 1916 and since that time production in that State has increased rapidly. In 1917 the total production from California and Washington was 317,000 tons, and it is estimated that it will be about 225,000 tons in 1918. Increased freight rates, shortage of cars which reduced the demand by hindering deliveries, shortage of labor, restricted building operations, increased importation of Canadian magnesite, and the use of dead burned dolomite are the main reasons for the decreased production in 1918.

The magnesite industry, owing to the use of the mineral as an accessory in making steel and copper, has been considered a war mineral. Because of its importance, the domestic industry deserves close attention at this time to tide it over what may be for it an emergency period. It is said that certain of the large companies, through their control of distribution and consumption, have sufficient stocks on hand to meet domestic requirements until well into the present year, after which they expect to begin importing from their own deposits abroad.

All import restrictions have been removed. It is reported that magnesite is permitted by the Italian Government to leave Trieste, if destined for the United States. The stocks in Trieste are not definitely known, but the presumption is strong that there are several thousand tons there and possibly stocks at other European ports as well.

Several of the consumers of domestic magnesite have, during the past year, expressed themselves as satisfied with the domestic material but afraid that with the return to normal conditions American magnesite may not be able to compete with the foreign article. Foreign labor is cheap, and this mineral comes over at low rates. The principal centres of consumption are nearer the Eastern seaboard than are the Western sources of supply. High freights may prove disastrous to the domestic industry.

Potash.

A serious crisis developed in the potash industry during January. Recent estimates indicate that about 100,000 tons, gross weight (equivalent to 25,000 tons K_2O), of potash salts produced in the United States during 1918 is still in the hands of the producers, who apparently can find no market for their product. The larger part of this material has come from the Nebraska lakes.

The explanation of this situation lies largely in the high war prices which have been about $4 per unit. The farmers are not buying potash salts except to a small extent, apparently in the hope that prices will drop before spring, or with the intention of not using potash until next fall. Unless the market improves quickly the potash can not be sold in time for manufacture and use for this spring's crops of cotton, wheat, potatoes and truck.

The potash producers report that inquiries were just beginning to come in for potash when Chairman E. N. Hurley, of the Shipping Board, made his announcement that tonnage would be available for the immediate import of Alsatian potash. This statement caused the market for domestic potash to disappear almost en-

tirely. The matter was taken up by the War Trade Board through its foreign representatives with the result that on January 25 the following statement appeared as public announcement in the Commerce Reports:—

"The War Trade Board announces that it has received authentic and official information from the French High Commission in the United States to the effect that France will be unable, at least until April, to ship potash from the potash mines of Alsace. These advices further indicate that for the next few months practically the entire potash output of the Alsatian mines will be urgently required for agricultural purposes in France. It is the view of the War Trade Board, based upon this information, that even under the most favorable circumstances, no potash from Alsace could be available in the United States for agricultural uses before June, 1919, and that, therefore, it will be necessary that the United States rely entirely upon its domestic production for the coming season."

Chrome.

The production of chrome ore is at low ebb and while there are no market quotations, there are a few shipments presumably upon existing contracts.

Ferrochrome is not quoted in market reports; there are, however, some movements of stocks of ore and alloy. On January 19, ferrochrome was selling for 40 cents per pound.

Lead and Zinc.

During the world war political jurisdiction was rather generally invoked in the allied countries to restore control of national resources and industries to citizens of a given country or its allies. This movement was particularly marked in the British Empire wherein there now exists an extremely centralized joint political and commercial control of the zinc industry in particular, based on the large production of zinc concentrates in Australia and expected production in Burma. In Australia, Tasmania, India, and the British Isles there has been Governmental participation in the producers' and sales organizations, and in the financing of power and smelting equipment.

In France this movement has taken the form of "consortiums" or associations of the principal factors in each industry, recognized by the Government and made the arbiters of all questions affecting their particular industry. The consortium of the mineral industry has been perfected into the "Societe Mineraux et Metaux," 154 Boulevard Haussmann, Paris. The official announcement states that this Society is organized under the auspices of the French Government in order to group the French metal producers operating both at home and abroad into a co-operative association for the purchase and sale of metals and metallurgical products.

The mining and metallurgical companies participating in the society comprise the principal companies in France producing or refining metals and also the lead, zinc, copper, iron, and smelting companies controlled by French capital in Spain, Algeria, Tunis, Mexico, and Peru. Thus, there is brought about a highly centralized organization of that portion of the mining and metal industry under French control for mutual protection and advantage in competition with other nationalities. This development is worthy of special note by everyone interested in the mineral industry.

The present annual output of the companies participating in the Society is about 200,000 metric tons of lead, 50,000 metric tons of zinc, and 40,000 metric tons of copper.

WILL ADOPT WHITLEY SYSTEM FOR MINES.

London, February 21.—The Mining Association of Great Britain, which comprises all the leading colliery owners, according to the Evening Standard, has decided to invite the formation of joint councils of miners and employers to manage mines in certain defined districts. These joint councils would arrange and fix the standard of wages, labor costs, management and interest on capital. The miners also would be brought into intimate contact with all problems relating to selling prices and costs.

At a conference of Government officials and representatives of a number of trades unions held to discuss the application of the Whitley system to Government establishments, the Minister of Labor declared that the Government was ready to apply the system giving workmen a share of the management in all Government workshops and yards. The object of the scheme is to ensure grievances being handled immediately they arise, thus preventing a strike and securing harmony in the industry.

A committee representing the engineering, shipbuilding and other trades was appointed to draft a constitution for the proposed Whitley councils.

The Miners' Federation has decided to accept the invitation to attend the industrial conference which the Government has called for February 27. It has decided also to communicate with Premier Lloyd George and inform him that the executive committee has not passed any resolution concerning the proposed miners' strike on the lines recommended by him, but will leave it to the delegates to the miners' conference to arrive at a decision.

NOVA SCOTIA MINERS AND OPERATORS CONFER.

Sydney, N.S., Feb. 21.—Closing one of the most harmonious sessions ever held between operators of the coal areas of Cape Breton and their employes last night two of the three concessions asked for by the workers were granted.

These were for permission to affiliate with the United Mine Workers of America and the granting of an eight-hour day for the underground workers of the mines. The third item in the routine business for discussion was that of wages, but as most of the associations are under contracts with the operators for a time yet this matter was not taken up seriously, only with a view of paving the way for the discussion which will come after these contracts have expired. Mr. Fergie, Mr. Tonge, Mr. Grey and other of the officials when questioned about the conference, stated that they had never attended a session where the spirit of good-will and tolerance was so manifest. There were many tangles to be unravelled and to be discussed, but while each side presented their respective cases with decision there was no actual ill-feeling and both sides are satisfied with their conclusion.

Special Correspondence

NORTHERN ONTARIO.

Increasing Activity in Boston Creek Gold Area.

Activity in the Boston Creek district is increasing, and large numbers of claim owners are making arrangements for the aggressive development of their properties during the coming spring and summer months. Preliminary arrangements are under consideration for the building of a light railway from Boston Creek station to the Miller-Independence mines. At the same time the government is being asked to construct a good wagon road from the station at Boston Creek to the centre of activity.

The shaft on the Allied Gold Mines property has reached a depth of 50-ft., and it is planned to continue this working to a depth of 100-ft. immediately. With this end in view additional men are being employed. Developments up to the present point of operation have been very satisfactory. Arrangements are being made at this latter property for the installation of an electric mining plant in the spring.

Will Develop Crawford Property.

A deal for the Crawford property in the Skead township section has just been completed. These claims are located next to the Costello group, on which spectacular showings of gold have been found. More or less energetic development has been under way in the district for the past two years. The purchasers of the Crawford claims anticipate commencing operations as soon as possible. The general outlook for this section of the gold area is very promising at the present time, and, in addition to considerable development now in progress, several other mining companies and private property owners are making arrangements for doing further work.

Will Install Plant at Chaput-Hughes Property.

Active mining operations have been commenced on the property of the Chaput-Hughes Mines, in the Kirkland Lake district. Ore broken in the first few shots is said to be of a commercial grade. A shaft has been sunk on the north-east corner of the property on a strong and well mineralized vein which can be traced the full width of the claim. A small mining plant will be installed on the property as soon as possible.

Developing Rich Ore at Bourkes Mine.

Rich ore is being developed in a shoot on the west drift of the Bourkes Mines at the 100 and 200-ft. levels. A winze is being put down from the 200-ft. level and the values are proving consistent in this working. Although the high grade ore at this property in the past has not proven altogether consistent, the present orebody is standing up well under development. The property is situated at Bourkes Siding on the T. & N. O. Ry. A number of other prospects in the vicinity will receive further development when the snow has left the ground.

Alexo Nickel Ore Shipments.

During the first week of the current month the Alexo mine at Porquois Junction shipped three carloads of ore containing approximately 280,000 pounds. This makes a total of about 680,000 pounds so far this month and it is estimated the mine will product about a million and a quarter pounds of ore for the present month. The ore is shipped direct from the property to the smelter at Coniston.

10 Tons Ore From Foster Netted $90,000.

The operators of the lease on the Foster property at Cobalt are prosecuting development work at the 60-ft. level of the mine for the purpose of cutting a number of veins which are known to parallel the one in which the rich ore shoot was recently encountered. It is now learned that the value of the recent shipment of ten tons of ore from this rich shoot netted the leasees between $90,000 and $95,000, which shows a silver content of upwards of 9,000 ounces to the ton. The possibilities of opening up other valuable ore shoots are considered good, while a considerable amount of good grade ore has been mined at the property in taking out the high grade shoot.

Stoping Ore at Adanac.

The stope recently started at the 310-ft. level of the Adanac property has been put up about fifteen feet and the ore being encountered continues rich in silver. A considerable quantity of this is of sufficiently high grade to make bagging necessary and this is taking place in the working. Additional shipments of high grade as well as medium grade ore will be sent out in due course. Additional working forces have been taken on at the property and the work is being speeded up.

Ore Sampling Plant at Cobalt.

Efforts are under way to have the ore sampling plant of Campbell & Deyell, at Cobalt, which has announced its intention of discontinuing operations early in March, supported by either the Federal or Provincial Government. This is the only customs sampling plant in the large mining district of Northern Ontario, in fact, so far as known it is the only one doing a solely customs business in the Dominion. Its value to the mining industry generally can hardly be over-estimated, and the suspension of operations by the concern would be a serious blow to the industry throughout the whole north country, causing no end of inconvenience and delay in estimating the returns of ore which is now sampled by this concern previous to treatment in the various smelters. The value of the plant to mines in the prospective stages of development where small test runs of ore are required is also of the utmost importance. Thus energetic measures are being taken to encourage the continuance of the plant's operation.

Wettlaufer.

According to the terms of the agreement between the Wettlaufer and Pittsburg-Lorrain Mining companies of South Lorrain, the latter company is obliged to resume work on the Wettlaufer property about the end of next month, provided the terms of lease now in force are complied with. It is understood the two companies are bearing an equal portion of the light expenses incurred while the plant is not in operation. During the year 1918 the mine and mill of the Wettlaufer were operated more or less satisfactorily under lease to the Pittsburg-Lorrain. At the present time there are no operating mines in this once busy section of the country.

Trethewey.

The annual report of the Trethewey Silver-Cobalt Mines for the year 1918 shows a net value of production of $250,534. As the operating cost was $147,166, net operating profits amounted to $103,368. Dealing with the physical condition of the mine, the report

says: "The productive area of the property comprises less than six acres, which is limited by the Keewatin formation to a depth of 250-ft. Up to the end of 1917 a total of 25,639 ft. of development work had been done, confined almost entirely to the above-mentioned area, leaving no territory where development could be carried on with promise. Consequently no development work has been done during the past year. The ore reserves at the end of 1918 show a decrease of 2,428 tons as compared to 1917. Blocked ore increased 1,581 tons, while broken ore increased 4,009 tons, the net decrease in tonnage amounting to 12 per cent. The estimated ounces of silver in the ore reserves decreased from 264,044 to 159,172, a decrease of 104,872 ounces, or 39 per cent. A total of 24,614 tons of ore was broken in the stopes at a cost of $54,268.26, or $2,21 per ton. As in the preceding years the ore was broken from the walls of old stopes and was of a very low grade, only the favorable price of silver, making possible the extraction of this silver at a profit. The revenue account showed that $135,748 had been carried forward from the previous year. This with the year's profits and $1,751 from readjustment, brought the total for approporiations to $244,372. Depreciation took $39,376, dividend (5 per cent) $50,000, reserve for taxes $3,604, leaving an increased balance to carry forward into the current year of $150,391.

The Trethewey company has taken up 370,000 shares of the Castle Mining Company's stock and the balance sheet shows $78,230 spent on the property. Current assets stood at $171,600, as against current liabilities of $20,000. The oil flotation parts were delivered late in the year, but operations from October forward showed a profit of $1.50 per ton. As there are 58,000 tons of dump the company expects to recover a nice profit from reclaiming operations.

Dealing with the Castle property in Gowganda, the report says: "The installation of machinery on the Castle property was completed in June. The plant consists of two boilers having a combined capacity of 110-h.p., a 360-720 straight line compressor, and an 8 x 10 hoist, pumps, etc.; the equipment being entirely suitable for the proposed development. The shaft reached a depth of 310-ft. in October, labor shortage causing serious delays. During November and December lateral work was carried on both the 200 and 300-ft. levels. Several promising veins were encountered, but none of them were followed up, the policy being to drive to the contact first. From what information it has been possible to gather best results will be obtained near the contact. Therefore, the work during the early part of 1919 is looked forward to with considerable expectation. The general geological conditions to date have been of a nature most favorable to the deposition of ore." Since the foregoing report was compiled, some very encouraging developments have taken place at the Castle property.

Porcupine Crown Plans Diamond Drilling.

According to advice to hand this week it is the intention of the Porcupine Crown Mining company to carry on extensive diamond drilling operations on their property. The known ore reserves of the property at the present time are estimated at $500,000, and it is generally expected that these will be considerably augmented. The main workings of the mine have been carried to a depth of 1,100-ft., and it is estimated that this ore body will persist on the Porcupine Crown to a depth of perhaps 1,400-ft. The mill on the property is one of the most efficient in the country and within a comparatively short time should be producing large profits. The company began the year 1919 with a credit balance of $271,955. It has been decided to recommence milling operations as soon as possible, and it is altogether probable that net earnings will soon be ample to resume dividend disbursements at the former rate of 12 per cent per annum, without drawing on the present substantial cash surplus.

Hollinger Increasing Production.

The Hollinger-Consolidated Gold Mines of Porcupine is reported to be increasing the production of the mill during the past week. This indicates that the production will probably be in excess of half a million dollars monthly, and should permit of profits in excess of $246,000 per month. The consensus of opinion in the north country is that the Hollinger-Consolidated will soon resume its regular disbursement of 13 per cent per annum, with fair promise of even this rate being exceeded, perhaps, by the beginning of another new year. The resumption of construction work, including the construction of a large number of new houses for the employes will be rushed through at once.

Will De-Water Schumacher Mine.

Arrangements are being made for the de-watering of the Schumacher mine, preparatory to a resumption of operations at the property. The Schumacher has been developed to a depth of 700-ft. and the mill on the property is the fourth largest in the gold camp. The company is well financed, having a surplus of around $80,000 and having authorized the sale of 100,000 shares of treasury stock at not less than 45 cents per share. This, taken together with the operation of the 180-ton mill, will allow for the continuation of the main shaft to a depth of 1,00-ft., as well as the increasing of the mill from 200 to 300 tons' capacity per day.

Mill Additions for Davidson.

A number of additions have been made to the milling equipment of the Davidson gold mining company at Porcupine. These enlargements are said to have been made necessary by the opening up of large orebodies at the 500-ft. level of the property. During the installation of the new equipment it was necessary to close down the pumps for a time, which permitted a quantity of water to accumulate in the workings. These are now being de-watered. When this work is completed energetic efforts will be made in the development of the new orebodies recently located at the 500-ft. level of the property, from which the management expects important results.

Sinking Shaft on Ontario-Kirkland.

After considerable delay in securing electric power the Ontario-Kirkland Mining Company has at last commenced its extensive plans of development, and the shaft on the property is being sunk to a depth of 300-ft. Ample funds are said to be in the treasury for the carrying out of 1,500-ft. of underground work which will be done in drifting on the main vein and cutting parallel veins at the 300-ft. level of the property. Judging by the assay reports on the veins uncovered on the surface of the property, the Ontario-Kirkland is a property of considerable merit, and the development of these ore bodies at depth means much to this section of the Kirkland Lake gold area. The veins on the surface are wide and remarkably consistent in value.

Proposes a 44 Hour Week.

A Bill has been introduced to the British Columbia Legislature providing for the application of a 44-hour week to all industrial workers of British Columbia. Its sponsor is Mr. James Hawthornwaite, the member for Ladysmith, B.C. There are on the statute books of British Columbia two Acts passed in 1918 through the instrumentality of Hon. Wm. Sloan, Minister of Mines. One sets the hours of labor for all employed above ground in connection with coal mines of this Province at eight hours, thus placing this class of employee on the same basis as underground workers, except that the latter's working day begins the moment they leave the surface. The other gives miners engaged in metalliferous mines, above or below ground, the eight-hour day. Both these enactments are effective on the 31st of March, 1919. If Mr. Hawthornwaite's measure is endorsed, therefore, it means that, in addition to the eight-hour day, the miners of British Columbia will have a half holiday on Saturday.

Control of Coal Prices in B. C. Has Ceased.

Mr. C. A. Magrath, Fuel Controller for Canada, has announced that the control of coal prices in British Columbia by the department of which he is the head ceased on the 11th February last. The collieries of the West, therefore, are put back on the old competitive basis. They once more are in a position to make their own prices, based on their own estimates of cost of production. That costs vary materially on the Vancouver Island was strikingly proved when, as a result of a close investigation, the Fuel Controller authorized all collieries of the district to increase their sale prices to a certain figure, excepting only the Canadian Western Fuel Company. It will be interesting, therefore, to watch developments, the controlling hand of Government being withdrawn.

In making known the determination of the Fuel Control Department as stated, Mr. Magrath explains that the United States Government abandoned control of prices at the mines on the 31st January. He explains that the reasons influencing his action are that the country's war activities, calling for greater and still greater quantities of coal for war industries, are at an end; that an exceedingly mild winter is being enjoyed in Canada, considerably reducing even normal demands for coal; and that the early return from Europe of many of those that formerly worked in coal mines should make easier the maintenance of production.

Addressing the western operators, he says:

"This great conflict through which we have passed has been a time of stress in mining operations, but I have reason to believe that between miners and operators in Canada, there now exists a far better understanding than in pre-war times. That is my experience in the adjustment of their differences in the Maritime Provinces. I have not had the same intimate relations with the industry in British Columbia, for the reason that in your district my official powers did not include such adjustments.

"As to the future, I have full confidence that both you and your employees fully appreciate your combined responsibilities to the country and that whenever differences arise you will frankly and openly meet each other in a spirit of fairness.

Carbondale and Coleman Miners Want Political Prisoners Released.

Conditions in the coal mining camps of parts of the Province of Alberta and Eastern British Columbia reflect, in a minor sense, the unrest prevalent in labor circles of Great Britain at present. This is indicated by the proceedings at a recent joint meeting of the local unions of Carbondale and Coleman, U. M. W. of A., Alberta, called for the purpose of hearing the report of delegates to the Alberta Federation of Labor Convention and also discuss a circular asking that the unions support a protest against the continued incarceration of political prisoners.

The debate on the latter subject resulted in the passage of the following resolution:

"What we endorse the action taken by the Alberta Federation of Labor Convention at Medicine Hat, demanding the release of all political prisoners, incarcerated during the war, and are ready to fall in line with any action the Executive of the A. F. of Labor may take, NO MATTER HOW DRASTIC, to attain that end."

Strong comment is reported to have been caused by the report of the arrest and conviction of Thomas Shannon, secretary for Diamond City Local, for having in his possession banned literature and other correspondence in connection with the Local. It was argued that if such a state of things were allowed to exist, all secretaries for organized bodies would be placed in a precarious position and liable to arrest at any time.

The following resolution was carried:

"Unanimously resolved that we urge upon all Locals in the District to take immediate action in this matter, fix a date as early as possible, and all cease work until Bro. Thom Shannon is released from prison."

The resolution passed in convention at Medicine Hat demanding free speech, free assembly, and the ban entirely lifted from all literature was also endorsed.

No Russian Coal Miners Needed.

Considerable feeling was created recently in some British Columbia and Alberta coal mining centres through a report that operators were arranging for the importation of Russian coal miners in order to enable the fullest possible development of the mines of the districts affected. The rumor was denied at the time, but it persisted and was taken up with the Department of Labor, Ottawa. The result is the following explanatory letter from Hon. G. D. Robertson, Minister of Labor, flatly refuting the statement:

Ottawa, Ont., Dec. 14, 1918.

W. F. McNeil,
1015 Herald Bldg.,
Calgary, Alta.

Your letter December 10th. On November 11th the Department received notice that the Canadian Pacific Railway Company was negotiating with the Western Coal Operators' Association respecting the importation of four hundred Russian miners and that several of the Western mines were not then working to full capacity through lack of orders. My wire of November 11th stated that inquiry was being made immediately respecting the supply and demand for miners. That inquiry confirmed the statement that mines were not fully occupied through lack of orders, that there was no necessity of importing Russian miners. The Canadian Pacific Railway Company was accordingly

Keeping Down the Cost of That Everyday Job of Conveying

FEW conveyor belts face extraordinary conditions, suffer extraordinary usage. It is on the everyday job — the steady grind — that a belt must make good to the last degree. Must give economical cost.

Take the Pacific Mills, Ocean Falls, B.C. Their conveyor job is to handle 45 tons of pea coal per hour over a distance of 476 feet. The conveyor runs level for 311 feet, and rises 30 feet in the remaining 165 feet. Motor 20 h.p. Head pulley 36 inches. Tail pulley 30 inches. Speed 285 feet per minute. Top rolls 6 feet apart. Return rolls 10 feet apart. Return rolls 10 feet apart. Not a big belt problem. But a place where the conveyor belt must give long, economical service.

We recommend Goodyear Extra Duty Conveyor Belting **5-ply** with a 3-32 inch cover.

This belt has a perfect service record up to the present—is still running and looks good for five years more service.

It is on just such jobs as this that Goodyear Conveyor Belting is winning the closest friends. If you have a conveyor drive on which costs are high, ask for a Goodyear belt man to advise with you. No obligation on your part. Phone, wire or write the nearest branch.

The Goodyear Tire & Rubber Co. of Canada, Limited

GOODYEAR

MADE IN CANADA

CONVEYOR BELTING

asked to discontinue any negotiations in this connection. Subsequently the railway advised that there had been no negotiations in progress, which fact was later substantiated from other sources. Your letter indicates that an utterly incorrect interpretation was placed upon the telegrams exchanged.

G. D. ROBERTSON,
Minister of Labor.

B. C. Chamber of Mines.

Vancouver, B.C.—The Vancouver Chamber of Mines has decided to change its name to that of the "British Columbia Chamber of Mines." This step has been agreed to in order that the influence of the organization may be extended to include the whole province. At the last election of officers a selection was made of some representative mining men outside of Vancouver, it being felt that, if the Chamber of Mines is to make its work beneficial to the industry of British Columbia, it must be understood to be a body belonging, not to any particular locality or community, but to the whole of the province and pledged to advance, wherever possible, the interest of all or any of its districts. Good progress is being made in preparations for the International Mining Convention to be held in March and the effect of which, it is hoped, will be the creation of a complete understanding between the mining men of Western Canada and the Western States and generally the engendering of a spirit of healthy optimism.

To Manufacturers

Valuable economic minerals, of which the people of this country as a rule have little knowledge, are distributed in various sections served by the Canadian National Railways. The field of utility for these minerals is constantly expanding and entering more and more into the realm of manufacture.

Information on this subject can be obtained by writing:—

The Industrial and Resources Department Canadian National Railways

TORONTO :: ONTARIO

THE LATE JAS. CUMMING,
A Pioneer of Cariboo, B.C.

Granby.

An unconfirmed report is in circulation to the effect that the Granby Consolidated Mining & Smelting Co. proposes suspending operations at its Grand Forks, B.C., smeltery. The statement emanates from New York and is creating some uneasiness in the Boundary District of the Province, which already has been somewhat seriously affected by the closing down of the Canada Copper Corporation's plant at Greenwood, B.C. Those on the ground, however, are hopeful that no definite decision of the character indicated has been reached. They point out that the company has other properties which might contribute to the smelter, among them being the Velvet, near Rossland, B.C. on, which considerable development has been done.

Ore Receipts at Trail.

The month of January established the best record for some time in point of ore receipts at the Trail Smeltery of the Consolidated Mining & Smelting Co. of Canada. A total of over 35,000 tons of ore and concentrates were unloaded at Trail in that period. Forty mines shipped to Trail in January, four being located in the United States, one in the Yukon, one in Manitoba and the balance in British Columbia.

UNITED MINE WORKERS AT CALGARY.

It was stated at the annual convention of District 18, United Mine Workers of America, which is being held at Calgary, Alberta, that there are 2,000 miners in the district without work, and that 3,000 others are only working part of the time. The seriousness of this situation, it was said, became accentuated when it was remembered that the slack time of the year was approaching.

CHEAP OXYGEN FOR METALLURGICAL PURPOSES.

At a meeting held at the Chemists' Club, New York, January 17, at which Dr. Frederick G. Cottrell, Chief Metallurgist of the Bureau of Mines, Department of the Interior, was presented with the Perkin medal for distinguished service in chemical research, Dr. Cottrell, in accepting the honor, outlined certain investigations now being undertaken by the Metallurgical Division of the bureau, which, if successful, will result in a real revolution in the fundamental industries of the country.

Dr. Cottrell, in telling the chemists of this important work, said in part:

"When, at the suggestion of Sir William Ramsay, the British Admiralty first studied the possible use of helium for balloon purposes, they felt that the expense of production would be prohibitive. First, on account of the great scarcity of the element and the very great dilution in which it was found in the atmosphere (1 vol. in 250,000) and in other gases; and, second, because of the expense of the processes of separation then known to the Admiralty.

"When this information came to the U. S. Bureau of Mines it was remembered that some of the natural gases of Kansas has been found by Dr. H. P. Cady, of the University of Kansas to have over 1 per cent. of helium in them. The separation of helium from these gases could best be accomplished by the same general processes of liquefaction and distillation as are used to separate air into its nitrogen and oxygen for industrial purposes.

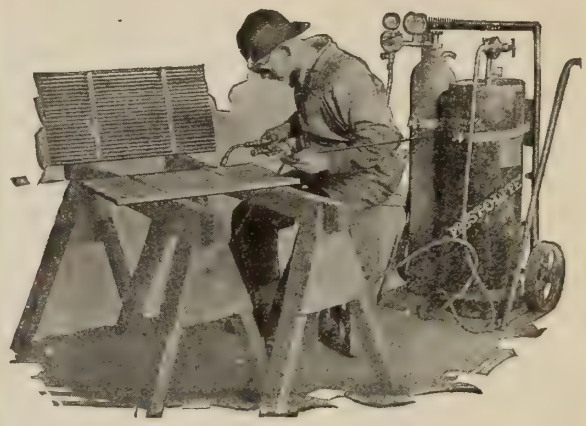
"It so happened that the Metallurgical Division of the Bureau of Mines had been making a study of these processes in the hopes of finding a way to sufficiently cheapen the production of oxygen from the air to allow its general use in metallurgical furnaces and other large scale chemical and industrial operations. If this were possible it would work a real revolution in these fundamental industries. Take, for instance, the smelting industry alone. We now concentrate everything that goes into the furnace (coke, ore, fluxes, etc.), except the oxygen of the air which we add with four times its volume of inert nitrogen and thus undo much of the effect of the concentration of the other cosntituents. If we could use pure oxygen, or more concentrated air, a great saving could be effected, and we could do in combustion furnaces much which is now only possible in the electric furnace.

"One of the processes which the Bureau had felt had much promise in this direction had not, up to this time, received an ylarge scale development, but now these facts were all called to the attention of our army and navy, who immediately jointly appropriated first $100,000 and afterwards further sums now aggregating over $1,000,000, for trying out the project not only along the line of the new process but also parallel therewith by the older and better known processes as well, and entrusted the general direction of this work to the Bureau of Mines.

"The plants on the older processes are already producing helium in large quantities and the one on the new and what it is hoped may prove several times more economic basis is just about to have its practical production test.

"If it fulfills anticipations, its significance is far wider than the production of helium, for it will open the possibility of oxygen in quantities at costs undreamed of by most chemists and metallurgists."

Oxy-Acetylene Welding and Cutting



Prest-O-Lite Welding Has Proved Its Value

In nearly every line of metal manufacture, from the making of delicate jewelry to massive locomotives, the Prest-O-Lite Process of Oxy-Acetylene Welding has firmly established itself. Where two pieces of metal are to be joined, it is supplanting the bolt, rivet and threaded joint in hundreds of factories and repair shops.

The above illustration shows a Prest-O-Lite operator reinforcing corrugated iron sheets saving the time and expense of boring and rivetting, simplifying the work, and producing a neater, stronger job.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

World's Largest Makers of Dissolved Acetylene

MINING CONVENTION AT VANCOUVER.

On March 17, 18 and 19 there will be held in Vancouver the first International mining convention on the Pacific Coast so far as Canada is concerned. Some months ago it was considered by prominent mining men connected with the Chamber of Mines that the holding of a convention would give a filip to the industry in British Columbia, accordingly arrangements were made to bring it off in January last. Several causes led to the date being set back, but the above have now been definitely agreed upon, and the largest assemblage of mining experts on the North American continent will foregather in the city on Burrard Inlet.

The object of the convention is to give the citizens of British Columbia who attend, and those resident outside the province, an idea of the tremendous mineral resources of British Columbia and in that way to advance the interests of the mining industry in British Columbia as far as it is possible to do so. Those who are interested financially and otherwise in mining are of the opinion that there is a bright future ahead and that the coming convention will be the means of making the wealth of British Columbia better known to the world. In order to impress on visitors the splendid resources of British Columbia in minerals, a great collection of ores will be shown, and the mechanical se tion will not be the least interesting part of the di play.

The treatment of ores in the various stages will be d monstrated from the moment they leave the workin until they appear as the well known metals, such silver, gold and iron, and special attention is to be gi en to this department by a committee. No effort wi be spared to make this a fine exhibition. In then selves, these exhibits will be a splendid object lesson the manner in which ores are treated.

It is proposed to invite prominent engineers an geologists from all over Canada and the United State Already, invitations have been issued and a general a ceptance is anticipated. Men who are identified wit the largest mining corporations have already commence to make inquiries regarding the convention. It is e pected that the attendance will be of a thoroughly r presentative character.

The programme will include addresses by the distri mining engineers as well as by at least six prominer mine operators. A trip to a large mining centre being arranged. The details of this programme wi be given in a few days. Meanwhile, everything poin to the convention being an unqualified success.

FINANC DEPARTMENT

DOMINION INCOME WAR TAX ACT

TO WHOM APPLICABLE.

Every person who in 1918 resided or ordinarily resided in Canada or was employed in Canada or carried on business in Canada including corporations and joint stock companies

WHO SHOULD FILE RETURNS.

1 Every unmarried person or widow or widower, without dependent children under twenty-one years of age, who during calendar year 1918 received or earned $1,000 or more.

2 All other individuals who during calendar year 1918 received or earned $2,000 or more.

3 Every corporation and joint stock company whose profits exceeded $3,000, during the fiscal year ended in 1918.

FORMS TO BE FILLED IN AND FILED.

FORM T1. By individuals, other than farmers and ranchers
FORM T1A. By farmers and ranchers
FORM T2. By corporations and joint stock companies.
FORM T3. By trustees, executors, administrators of estates and assignees.
FORM T4. By employers to make return of the names of all directors, officials, agents or other employees to whom was paid $1,000 or more in salaries, bonuses, commission or other remuneration during the calendar year 1918
FORM T5. By corporations, joint stock companies, associations and syndicates to make return of all dividends and bonuses paid to shareholders and members during 1918.
Individuals comprising partnerships must file returns in their individual capacity.

GENERAL INFORMATION.

All returns must be filed IN DUPLICATE.

Forms may be obtained from the Inspectors and Assistant Inspectors of Taxation and from the Postmasters at all leading centres.

Returns should be filed immediately

Postage must be prepaid on letters and other documents forwarded by mail to Inspectors of Taxation.

:-: EDITORIAL :-:

NOVA SCOTIA'S SUBMARINE COAL MINING PROBLEM.

A question of considerable interest, both from an engineering and a legal viewpoint has arisen in relation to the undersea extension of the Sydney (Cape Breton) coalfield. The system under which, during many years past, the undersea coal areas have been leased for operation and the mining of the coal contained therein, has permitted the "blanketing" of the leases of one lessee by those of another lessee, and a situation has now developed which calls for some remedial and corrective action by the Province, which is the lessor of the coal areas. The speech from the Throne at the opening of the local Legislature recently forecasted the intention of the local Government to enact legislation designed to correct the existing condition and "to protect local industries."

In this connection, the following remarks by Mr. F. W. Gray, which formed part of a review of coal-mining affairs in Nova Scotia during 1918 contributed to the "Halifax Chronicle" may be of interest to readers of the Journal:

The recommendation of the Fuel Controller that the Nova Scotia Steel & Coal Company should be allowed to mine certain areas leased by the Dominion Coal Company from the Province which abut upon the present workings of the Princess and Florence Collieries in such a manner as to prevent the seaward extension of these collieries, has brought prominently to public attention another deterrent factor in the future of the coal industry not hitherto disclosed.

It is not proposed here to enter into the merits of the controversy, which would be an invidious and delicate task, nor to deal with the causes that have created the present tangle of the submarine coal areas, because they have operated over a hundred years of the past, and as they form part of the history of the growth of responsible government in Nova Scotia, they bristle with controversial possibilities.

Be that as it may, the lease plan of the Cape Breton submarine coal areas as it exists today shows a checker board of conflicting and interfering leases that absolutely inhibit the extraction of the submarine coal by the methods which would commend themselves to a mining engineer interested in the best; the most complete and the most economical extraction of the submarine coalfield.

If some mischievous imp, some Teuton brownie from the Ehzgebirge, had set to work to "queer" the future of the submarine coalfield, it could not have been more thoroughly accomplished than is actually the case.

The lease lines that crisscross the submarine coalfield violate every physical and geological consideration, and this is what might be expected, because they were not designed to conform to natural limitations, but were arbitrarily drawn to further disconnected and often conflicting private and corporate interests during many generations. The last and the least consideration that has governed the framing of the inextricable maze of submarine leases has been the preservation of the coalfield for economical and lasting operation.

One can only say of the lease plan that, like Topsy, "it growed." No person living is to blame for the tangle, but the remedy is within the power of those who administer the coal areas as stewards for the people of Nova Scotia.

It is not realised that the Cape Breton submarine coalfield is a unique deposit of coal. Its exact extent is unknown, but we know enough of its probable extent to state confidently that it can provide millions of tons of coal per year for hundreds of years to come if—and here is the rub—if it is conceived as one vast mining operation, as a field in which one false or unwise operation may depreciate the value of the whole, and even impair its accessibility.

In a Memoir on "The Coalfields of Eastern Canada" written for the Federal Department of Mines three years ago, the writer in summarising the mining laws of the Province in relation to the unworked submarine coalfield, hinted at the state of affairs which has now been revealed by the Fuel Controller by remarking that it was the obvious duty of the present generation:

> "so to prosecute the work of extraction as not to imperil the accessibility of the remaining submarine coal."

This is precisely what the present arrangement of the submarine leases will not permit of being done, and if the future mining operations under the sea essay the thankless task of adherence to existing lease lines, it will result in imperilling the greatest single asset of this Province.

The extraction of the submarine coal under the most natural conditions is equivalent to their extraction under the least costly conditions.

This means everything to the Province as landlord of the leased areas.

In discussing the limitations to working the submarine coalfield, in the Memoir just referred to, the writer ventured to predict that the cost of mining would be the first limiting factor to make itself felt. If this is the case, it is extremely desirable that no artificially difficult conditions of extraction should be unnecessarily imposed on mining coal from submarine territory, because this will cause the limit of profitable mining to be reached sooner than would otherwise be the case, and the Province will the earlier lose its revenues and all the other advantages that accompany the production of coal.

If it had been possible that the leasing submarine areas could have been governed by previous experience in their operation, it would have been realised that a submarine coal area is not comparable to a land area, because a land area can be reached by shaft or slope from the surface at any point, but access to submarine areas is limited to certain parts of the shore, and it would have been seen that no submarine leases should have been granted, unless their accessibility was secured by the terms of the lease itself. Of course, hindsight is distinctly better than foresight.

The conflicting interests of the coal operators—or rather their supposedly conflicting interests—have hith-

erto prevented them from making an unprejudiced survey of the future of the submarine coal areas. It has not been realized that submarine coal extraction in this Province is as yet only an economic experiment, and the success of that experiment is not any too clearly demonstrated.

In view of the gloomy outlook for the coal industry in Nova Scotia, it would be well if it might be seen that a persistence in the present unscientific and mutually destructive policy with regard to submarine coal areas may involve in general disaster all concerned, operators, miners and the country generally. The industry is admittedly going to have sufficiently hard work to keep its head above water without the addition of unnecessary duplication of expenditure and effort, and without the totally unnecessary addition to the cost of extraction which adherence to existing lease lines will inevitably cause.

The truth is that the whole submarine coal question is due for review.

A plan should be made of the whole coalfield from Cape Dauphin to Mira Bay showing the existing submarine workings, the course of the land and submarine outcrops, the course and nature so far as known of the parallel folds and faults that traverse the coal field. Due consideration should be given to the facts disclosed by soundings at sea, the nature of the sea-bottom, the depth of superincumbent strata, the spacing of the coal seams, and the probable extent of the submarine coalfield.

This plan should be viewed as a whole by competent mining engineers, who should disabuse their minds of any questions concerning lease lines, and it should be conceived as one operation, from the viewpoint of the owners of the coal, not the viewpoint of the leaseholders.

The conservation of the submarine coal, its protection from inundation, creep, incompetent mining, and the preservation of its accessibility over the maximum period of operation, should be the guiding ideas; and, if this were done, it is certain that a radical re-arrangement of the submarine leases would result that would benefit everybody concerned, even those competing coal operators who do not today apprehend the true significance of the signs of the decadence of the local coal industry, and the necessity for compromise and reasonableness unless all alike are to be involved in a common future disaster.

THE DOLLY VARDEN RAILROAD.

An investigation is in progress before a special committee of the Legislature of British Columbia of vital importance to the mining industry of the Alice Arm Section of the province, which is believed to be one of the richest mineral bearing areas of the north-west coast of America.

The trouble is over an eighteen mile narrow guage railroad which was constructed from the coast into the mountains for a distance of eighteen miles, its purpose being to provide transportation facilities for the Dolly Varden mine and for other promising properties along its route. The road is almost complete. When within a very short distance of its goal work ceased. The Taylor Engineering Company, the contractors, were short of funds. Workmen found themselves laid off without pay and without notice. Since then a mining district which was being rapidly developed, and the promise of which became brighter as time went on, has lacked most of the signs of industry. The workmen are waiting for their wages and mine operators and prospectors are waiting for the tangle to be straightened out.

Since what has been detailed occurred, various things have happened. The property of the Dolly Varden Mining Company, which includes the road, has been sold to the Temiskaming Mining Company of Toronto, the consideration being $700,000. Mr. A. J. T. Taylor, president of the now defunct Taylor Engineering Company, has applied to the Legislature of British Columbia asking that the Dolly Varden Mining Company, former owners of the property, be compelled to meet what he claims to be its liability to the constructors of the road. He has given testimony that the work was started on a ten per cent plus basis on a written estimate that the road would cost not more than $175,000 and a "gentleman's agreement" with Mr. J. D. Hubbard, president of the Dolly Varden company, that he would see that any cost above that amount would be met. The enterprise, however, cost considerable more than the mentioned figure, apparently, as Mr. Taylor's claim is for $467,000 although he states that he offered to reduce this to $375,000 if the company would pay it from the $700,000 received, or to be received, by virture of the sale of the property. His petition to the Legislature is that a renewal of the charter, under which the railroad is being built, be refused, thus preventing the finishing of the several hundred yards of steel yet to be laid, pending the satisfaction of his demands. The Dolly Varden Company takes the position that the petitioner should share with them in the general loss, it being their assertion that the sale, at the price given, has meant a loss to them.

In support of Mr. Taylor's position interesting evidence has been given by Mr. J. S. Connell, C.E., who was the engineer in charge of construction. The original estimate of $175,000, he said, was for a rough road which would follow the centre of a pack trail in order to enable thirty tons of concentrates to be brought to tidewater daily. No surveys were made, as the Mining Company wanted speedy action. After work was commenced, unexpected difficulties were encountered. The road in some places had to be cut out of solid rock on the walls of gorges and canyons so precipitous that the men were lowered down with ropes to start a foothold. After the road had been partly made, Mr. Connell said, the cost had been greatly increased because it had to be cut out two feet wider and the curves made to conform to the requirements of the expected buyer, the Granby Consolidated Mining & Smelting Company, which proposed to take out 400 tons of ore daily. It may be said incidentally that the statement has been made in the course of the inquiry that the Granby Company actually made an offer of $850,000 for the property, which was declined owing to objection being taken to the terms of the proposed agreement.

It is likely that the Committee of the House having the investigation in hand will be in a position in the course of a few days to submit a recommendation to the Legislative Assembly. Pending this and some disposal of the petition by the members of the house, the railroad is tied up and mining operations in the district at a standstill.

An amendment to the Mineral Survey and Development Act of British Columbia, giving the resident mining engineers of the Province power to enter into mines and plants in connection therewith for inspection purposes, has passed the Provincial Legislature and will become law on receiving the assent of the Lieut.-Governor.

The Wealth of the Hinterland of Ontario

By J. A. McRAE.

Scanning the hills of the North who can estimate their potential riches? To those not familiar with the North we would say: Vision these hills, ridge upon ridge, row upon row and almost endless, stretching hundreds and even thousands of miles through the wild. During the past few years a world of men made purblind in the mad rush of war and war industries, have been passing along the main highway —have passed our very threshold, and have failed to see. They have seemed to overlook the fact that in a brief span of the opening years of this twentieth century, the precious metal mines alone have yielded nearly one-quarter of a billion dollars. Perhaps they also fail to realize that in a lesser space of time it will yield as many more. Other veins, moss-covered, or perhaps exposed to the sun, await discovery. Other mines, possibly, the richest of them all, are to be developed.

In recent times the old-time prospector has been considered a back number who has largely outlived his usefulness, and considered out of place among modern surroundings. Now, however, his importance is becoming better realized than ever before. Modern mining machinery and modern ore treatment methods are resulting in intensive mining, which shortens the lives of the mines. As a consequence, far sighted men are pointing toward the urgent need for a greater amount of prospecting and the opening of new producing properties.

There is only one way in which mineral deposits are to be found, and that is to search for them. This, clearly, is the logical task of the prospector and he should be encouraged to put forth his best efforts in the exploration for additional mining fields, and in being adequately rewarded for his discoveries. The Ontario Bureau of Mines is paying particular attention to the prospector. Anything that will tend to promote greater activity among the prospectors, and anything that will prove beneficial to them finds ready recognition. His burdens are still heavy, but in order to keep the wildcatters and claim blanketers from getting too strong a foothold in the mineralized area, these burdens cannot be removed. Therefore, in a sense, these very burdens afford protection to the legitimate prospector. Despite burdens, the genuine prospector has refused and still refuses to be downed. He continues to trudge over the hills in search of hidden millions which he invariably feels certain he will ultimately find. And in many instances his most resplendent dreams come true. He it is who discovered all the mines that are now making the shareholders of the mining companies rich and which gives labor to a veritable army of men. To him the world is indebted for the discovery of its most profitable mining areas. He is entitled to liberal legislative recognition; and, as producing mines grow fewer, while the metal demands grows larger, he is, at last, coming into his own. The Mining laws of Ontario have been designed to encourage him.

Favored with thousands of square miles of undeveloped mineral lands where the geological conditions point toward the likelihood of numerous great precious metal mining camps; favored with unlimited water, which from babbling brook to broad rivers afford arteries along which the seeker of mines may roam with ease and when finally harnessed would generate abundant power to drive industrial wheels; favored with timber lands, unlimited as far as the use of the pioneer is concerned, and under Great Britain's flag of freedom where laws are made for those who try; favored with the protection of an Anglo-Saxon race, this country, this Northern Ontario on the fringe of which we live, offers to mining men the world's greatest promise.

The North values highly its man of creative genius — that is to say, its optimists. Had it not been for such men there would perhaps have been no Cobalt, no Porcupine, no Kirkland Lake, and no Boston Creek. The prospector is an optimist. It should also be pointed out that there is another optimist — the man with money and with sufficient courage to apply it efficiently in the development of promising mining areas.

A few years ago the great majority of people frowned upon the narrow veins of Cobalt. In the early days the surface discoveries of Porcupine, looked dubious, and were often referred to pessimistically. At first the veins of Kirkland Lake appeared narrow and inconsistent. In a word, in each case, the opinion of many people was one of grave uncertainty. Yet, in each case the optimists came to the rescue, and, with courage commensurate to their optimism, applied their finances lavishly but efficiently and made the north country the great mining centre that it is to-day. To these men of creative genius the Dominion of Canada owes a debt of gratitude, and to them Northern Ontario owes its present great prosperity. It was they who laid the foundation for the rapid progress now taking place.

Therefore, when some day historians will write the closing lines of the mining era of Northern Ontario, let them not forget the part played by the prospector and those who have backed his efforts with their finances.

In Temiskaming less than twenty years ago the moon rose and set, and old Sol spent his sunny smile on a land bedecked with stalwart pines that moaned with the fragrant breezes and where murmuring brooks rippled their way like silver threads through valleys clothed in forest shadow. On every hand was the verdant sweep of unbroken timberlands, the hunting ground of Indians. Little did they think that beneath the ground—perhaps beneath their vedy camp-fires — lay the world's richest deposits of silver or veins of virgin gold.

The fabulously rich deposits of silver at Cobalt, for more than a century lay in the very shadow of old Fort Temiskamingue. Throughout the days and the nights, the months and the years, no sentinel kept vigil over this vast storehouse of precious metal. Nature itself flung its camouflage of moss over the weathered and jagged outcrops. The question is often heard: 'will history repeat'? From farther north comes the answer, emphatic, and in the affirmative.

Less than 100 miles north of Cobalt, where less than ten years ago was naught else known to man but unbroken wilderness, now lies the world's greatest gold

mine. Round about it are being developed other gold mines of greater proportions. Up until ten years ago an Indian trail wound its way over "Hollinger Hill" from which in the past few years has been mined some $26,000,000 in gold with at least $41,000,000 more blocked out and ready to mine. It is perhaps a revelation to many to learn that within the memory of the youngest of full grown Indians whose haunts were the Porcupine regions, is the picture of Indian tee-pees sitting squat and picturesque on the very brow of that now famous hill. Down over that old trail the Redskins have trekked to and fro, fleet of foot, down through the centuries. Over its winding way had tripped smiling Indian maidens at the heels of their braves. And all the while on either side lay great quartz veins containing scores of millions in gold. Readers may say: Yes, but all this is past! To what avail is this fact in history! How are we to win a share? Are we not too late?

Round about is spread a land pregnant with the answer. At the discovered mines the great whistles that call to toil a veritable army of men, send out their echoes and re-echoes through the valleys and the hills. Farther away comes the faint ring of the prospector's pick on the hillsides as though whispering back an answer from the mines that may yet be born.

Will history again repeat? The probabilities appear to be that it will, not only once, but time and time again—so vast is the precious metal bearing zone as yet practically unexplored.

JUALIN ALASKA MINES.

Work will be resumed at once on the property of the Jualin Alaska Mines Co., at Jualin, Alaska. This property was taken over in 1912 by The Algunican Development Co., a Belgian-French company, with head office at 16 Rue de Turin, Brussels, Belgium. At that time a 7,800 foot tunnel was started, intended to crosscut the vein system at a lower depth and also to drain the mine water. This tunnel, which had advanced 2,000 feet, was discontinued when war broke out and attention confined to the actual production of the mine. All work was suspended in November, 1917, owing to the labor shortage and extreme operating conditions. During the last operating year this mine produced nearly $200,000 in gold from a ten stamp mill.

It is now proposed to complete the tunnel and at the same time carry out an active programme of development from the present workings. Until the completion of the tunnel no ore will be milled except that obtained from developing headings.

Jean Vanophem, Brussels, Belgium, is president. Chas. G. Titus, Juneau, Alaska, is general manager.

Ore receipts at Trail in gross tons for the week from 1st February to the 7th of the same month totalled 8,402, which makes an aggregate for the year of 43,685 tons. Of the latter total the Boundary District contributed 3,321 tons; East Kootenay, 22,704; Nelson and Salmo, 353; Rossland, 14,275; and Slocan and Ainsworth, 1,761 tons.

Slocan, B.C.—The Noble Five and the Ivanhoe Mines of the Slocan District, which were practically closed down during the influenza epidemic, have resumed operations with full crews.

WAGES, HOURS AND UNION CONDITIONS AT THE NOVA SCOTIA COLLIERIES.

In October 1918 the Amalgamated Mine Workers of Nova Scotia met in convention in Sydney and formulated a schedule of wage rates and working conditions constituting the proposed basis of a new arrangement with the coal operators at those collieries where the workmen were represented by the A. M. W. of N. S. to follow the expiry of the wage agreement which terminated at the end of 1918. The demands contained in the schedule were very large, and involved some radical innovations in working conditions, such for example as an eight hours day, and the substitution of the short ton as the basis of payment for the long ton with the retention of former or increased tonnage rates. The increases contemplated by the schedule, if applied, would have meant an addition of three dollars per ton to the cost of mining coal.

At the call of the Minister of Labour the union representatives were asked to meet the coal operators in Montreal, and a meeting of a preliminary character was held there in January, which was adjourned after arranging for a further meeting in Sydney to be held in February. At the meeting in Montreal the workmen of the Pictou and Inverness Fields were not represented, these districts being organized under the American Federation of Labour, but invitations were issued asking that these districts should be represented at the meeting in Sydney.

On the 19th February, delegates from all the collieries of the Province assembled in Sydney and met in joint conference representatives of practically all the coal companies in Nova Scotia. The joint conference brought together a very large gathering, there being almost two hundred union delegates present and about twenty representatives of the operators. From the main conference a sub-Committee was appointed to examine and report in detail on the matters in question which were chiefly three, namely, the request of the workmen for an increase in wages and the formulation of a new wage agreement, the granting of an eight hour day, bank to bank; and the assent of the operators to the intention of the Amalgamated Mine Workers to join the United Mine Workers of America.

The sub-Committee continued in session throughout the remaining portion of the week, and made recommendations, which were afterwards accepted by the workmen, of a most important and far-reaching character.

On the matter of wages the operators stated from the outset that the condition of the coal trade, the already greatly increased and unprecedented cost of mining, the reduction in production and the competition from outside fields, would not permit of the granting of any increase in wages. It was pointed out, and was of course well known to the delegates present, that many of the mines in the Province were either entirely idle or were working intermittently because of the slackening of demand for coal in the Province and the temporary inaccessibility of the Montreal market of Nova Scotian coal, so long as the shipping shortage continued and high freighting rates prevailed. An increase in wages could only result in a greater amount of idleness, and as there was a disposition on the part of the operators to consider some modification of the working hours — which in itself is equivalent to a large increase in wages — the sub-Committee reported in favour of allowing the matter of wages

stand untouched, subject to notice of adjustment by either of the parties upon thirty days notice. Provision was made for adjustment of local conditions which might arise.

On the matter of the Eight Hour Day, the sub-Committee reported as follows:

"The operators have carefully considered the proposal of their employees for an eight hour day, and being most desirous as far as possible to meet their wishes, would submit the following offer:

1. The collieries will commence to hoist coal at 7 a.m., at which time all the men must be in the mine.
2. The day's work will cease at three o'clock, when all arrangements will be available for conveying the men to the surface.
3. The surface men around the bankhead and screens associated with the handling of coal are to be on duty betwen the hours of 7 a.m. and 3 p.m., and for a short time after if necessary for the purpose of attending to such duties as will facilitate their own work, such time not to exceed half an hour.
4. The standards of other surface labor around the collieries to be from 7 a.m. to 4 p.m. with half an hour for dinner.
5. Where continuous attendance is required, the shifts will be eight hours instead of twelve, both surface and underground, at the same pay.
6. The conditions peculiar to certain localities will be adjusted locally.
7. To become effective March 15th, 16th or 17th, according to the date of making up the payrolls.

NOTE.—Explanation of Clause One means that the mine will run continuously between the hours named without any stop whatever.

The management of the Dominion Coal Company promise to meet the Executive at an early date, in connection with other departments such as the machine shop and section men, and it is expected that other companies with similar work will do likewise."

In regard to the announced intention of the A. M. W. of N. S. to join the United Mine Workers of America, the sub-Committee reported as under:

"After having had the assurance of the Executive of the Amalgamated Mine Workers of Nova Scotia and the representatives of the Federation of Labour, confirming the statements made in Montreal by Mr. Harlin of the United Mine Workers of America, that the desire of the A. M. W. of N. S. to have the U. M. W. of America extend its jurisdiction to Nova Scotia does not arise from any intention to make the wage rates and working conditions of Nova Scotia conform to those obtaining in other districts of the U. M. W. of America, and that local districts will receive complete autonomy, and also that the limitations of Nova Scotia in regard to outside competition in the sale of coal and recognized by the incoming U. M. W. of America, and will always be borne in mind in the future, the operators agree to the extension of the U. M. W. of America into Nova Scotia, if that should be the desire of the majority of the mine-workers."

The net result of the Convention therefore was an agreement to leave the matter of wages and a new working agreement in abeyance until the changing conditions of the coal trade permit of accurate views as to the future of trade conditions; the granting of a modified eight hour day, and the extension of the jurisdiction of the United Mine Workers of America over the whole of the collieries in Nova Scotia.

The holding of the Convention and its outcome, is one of the signs of the times, and your correspondent is reluctant to add words of comment at a time when the world generally is tired of opinions and theories, and when events are taking place quicker than the average scribe can describe them.

One might comment however that the agreement upon an eight hour day contains the germ of much that is yet to occur in connection with the coal trade of Nova Scotia and its future progress. It is not conceivable that it will long be regarded as good business to have the entire development of a large colliery and its costly equipment producing coal only eight hours out of every twenty-four, and possibly working only five days per week. If business acumen should allow this, or the attitude of the workmen should attempt to compel a retention of the single shift system, the competition of outside sources operating under conditions of more complete and continuous utilisation of the mine equipment, will compell Nova Scotia to conform to more modern methods of concentrating the working forces, or go out of business as a coal-producing province. In other words the necessary accompaniment of an eight hour day is the double or triple-shift system.

The compelling factor in Nova Scotia is the large percentage of the untouched coal reserves of the Province which lie under the sea. These deposits are large, but the points where access can be obtained are few and the outlet, or the "bottle-neck" is limited. Practically continuous hoisting up large shafts is the only way in which large bodies of workmen can be employed in mining coal from under the sea, and it can easily be seen that the adoption of an eight hour day, which if rigidly enforced would limit the hours of hoisting within a small and rigid compass, will take a great deal of working out unless the production of the collieries working under the sea is to be distinctly limited and shortened from now onwards. Other results which must follow are more intensive production during the prescribed hours of labor, the tremendously increased utilisation of mechanical devices, and arrangements for production on a large scale. This in turn will involve capital expenditures beyond the capacity of the existing coal companies, and above all, the future of the industry will be conditioned to the fact that coal-mining in Nova Scotia must always cost relatively more than in the United States and in other coalfields that do not come so directly into competition with the product of Nova Scotia.

The further working out of the hours problem at the collieries in Nova Scotia will be interesting to follow, but a casual consideration of the problems involved will indicate that while it is one thing to agree to a principle it is quite another matter to work it out in practice.

One very pleasing feature of the Convention was the consistently high level of the discussion, and the fair open and considerate manner in which both sides thrashed out their difficulties and endeavoured to merge their differing viewpoints. The whole Convention was significant, in view of much that has passed, and much that is still to take place, but from this point of view, distinctly hopeful and of good augury for the future.

New Legislation Affecting Coal Mines of British Columbia

Regulations of first importance to the coal mining industry of the Province have been laid before the British Columbia Legislature by Hon. Wm. Sloan, Minister of Mines, in a Bill entitled "An Act to Amend the 'Coal Mines Regulation Act'". They will radically change for the better the present system of conducting examinations for 1st, 2nd, and 3rd class coal mining certificates, removing much of the present superfluous administrative machinery by placing the now widely distributed authority in the hands of one competent and responsible board of examiners. The same applied to the existing methods of examining and issuing certificates of competency to coal miners, and it is being proposed that one travelling board of examiners shall have charge of this important work, the duties of which shall be to go from colliery to colliery throughout the province for the purpose of passing upon the proficiency of coal miners applying for certificates. Various other changes are provided for, having in view making the mines safer and removing, as far as possible, the chief dangers with which the underground workers have to contend. In some of the latter legislation British Columbia is setting the pace for America, notably in respect of the proposal that all wire cables shall be given hot oil baths at regular intervals and that amendment which in its application, will practically eliminate all but safety lamps in underground coal workings.

Minimum Wage Board.

The initial provision of the Bill is under the sub-title, "Constitution of Coal-Miners' Minimum Wage Board." The text of this section is clear in itself. The said board is to consist of the chief inspector of mines as chairman and "two other members to be appointed by the minister, one of whom shall be appointed to represent the mine-owners and one to represent the coal-miners." The duties of this board shall be to "define and redefine any portion of the province as a minimum wage district for the purposes of this section; to improve conditions and exceptions to which the application of the minimum wage in any district shall be subject; and to regulate the time and manner of giving notice of the sittings of the board and the conduct of business thereat." Having fixed a district to which a minimum wage shall apply, its duty, naturally, shall be to decide what the minimum wage, within the bounds of the area, shall be, proper consideration being given to general conditions as may be shown by evidence or representations made by the parties affected. For the latter purpose a full opportunity is to be given for hearing at a public sitting of the board of all interested. Any order made shall come into effect on the minister's approval and its publication in the Provincial Gazette "at least thirty days before the day named for its coming into operation." If any coal-miner is paid less than the minimum wage to which he is entitled he may recover from his employer in civil action that which is justly due him. This will commend itself to all miners of British Columbia, and, in any event, it cannot but be considered as a step in the right direction, evidencing on the part of the government an active and direct interest in the question of the remuneration received by underground workers.

Board of Examiners.

The appointment of a board of examiners "to conduct the examination in any part of the province of applicants for certificates of competency," is another important innovation. At present this Board consists of three coal mine managers and three representatives of the men from different parts of the province, together with the chief inspector of mines. Its headquarters are in Nanaimo, B.C. Two of the men's representatives are of the Crowsnest Pass coal district, and in the past five years, on one occasion only has one of these representatives been able to attend a board meeting. While provision is made to pay the travelling expenses of those who have come from a distance this reimbursement by no means covered the loss of time which trips from various parts of the province to the coast entailed. The result has been that the board often found it difficult to obtain a quorum. Its duties, too, have been merely of a supervisory character in connection with examinations. It called a meeting, set a date for examinations, appointed outside parties to prepare examination papers forwarded these on their receipts, and passed upon by the appointed examiners forwarded the results to the Ministers of Mines. It is felt that much of this procedure is useless and besides has had the effect of leaving functions of vital importance in the hands of a few, it being impossible in many instances, as has been shown, for the men's representatives to be in attendance, at regularly called meetings. The proposal now is that the new board, shall be composed of three members only, one being the chief inspector of mines, as chairman, and two others to be appointed by the Minister, "one of whom shall be appointed as representing the coal owners and one as representing the coal miners." It will be the duty of this body, which will be small and by reason of that able to move easily from point to point if necessary, to conduct the examinations.

Conduct of Examinations.

The bill makes provision for another alteration in respect of the conduct of examinations of miners applying for certificates of competency. Under the Coal Mines Regulation Act as it stands most of the collieries have their own boards for this purpose, the membership of which consists of a secretary appointed by the Lieutenant-Governor-in-Council, a representative of the mine management and a representative of the men. This arrangement, it is pointed out, was satisfactory so long as there were only a few large operating mines in the province. Conditions, however, are changed. There are now a considerable number of small collieries, and, if each of these were given a board to which they are entitled under the Act, there might be almost as many members of examining boards as there are miners come up for examinations monthly. The situation at the moment is that there are small mines such as that at Telkwa, Northern British Columbia; Coalmont and Princeton in the Interior, and Granby and Nanoose on Vancouver Island which are without boards. Consequently miners applying for certificates to work in any of the latter mines must travel considerable distance, in many cases, to take their examinations. Telkwa miners, for instance, must come to Nanaimo; those of Coalmont to Merritt; and

those of Nanoose to Nanaimo. In other words, if the methods now in vogue were continued, it would be necessary to appoint at least five boards in addition to the nine now organized and some of these would have to be maintained in camps where the number of miners employed is exceedingly small. The board proposed to handle all examinations for miners' certificates of competency, will eliminate this cumbersome machinery. Its personnel will be fixed in the same way as that of the board of examiners for "managers of mines, overmen, shift bosses, shotlighters and mine surveyors, except that the inspector of mines, for the district in which the examination is held," will be the chairman instead of the chief inspector of mines. The other two will be named by the Minister of Mines, one as representing the operators and the other the men. The two latter will have jurisdiction throughout the province and will move from colliery to colliery at frequent intervals in order to facilitate the issuance of certificates to those who can show that they are properly qualified. This will have the effect of fixing a standard of knowledge for coal mines throughout British Columbia. It will obviate the present difficulty of too much board representation at one point and too little at another; and it will be an added convenience, both to the men and the management of collieries. Another improvement in this connection is that no man will be admitted to a mine to work as a coal miner for a temporary period, pending his examination, as is now allowed. If a man applied for work as a miner and an examination immediately is impracticable he must go before the inspector of mines of the district who, having satisfied himself of the man's qualification, will issue him a temporary certificate. In such cases, however, those affected must go before the regularly constituted board at the first opportunity. The position taken by Mr. Sloan here is that it is a manifest absurdity to allow an uncertificated man to assume the responsibilities of a miner for thirty days without his knowledge being tested, it being possible in that period for an incompetent person to endanger, not only his own life, but that of hundreds of others. ...

Besides such a system, it is considered, will facilitate the control of the practice, where it has been followed, of permitting aliens to work underground. This is a matter on which Mr. Sloan feels strongly and he is confident that, when it is necessary that every man going to work as a miner for any period, no matter how brief its duration, shall prove his qualifications the employment of this class will be effectively checked.

Duties of Fireboss.

A clear definition of the duties of a fireboss in a coal mine also is given by the amending measure, it being set out that "the district of a mine assigned to any fireman shall not be of such size as to prevent him from carrying out his inspection duties under this rule in a thorough manner." It has been a standing complaint on the part of men holding this position, and coal miners generally, that firebosses are handicapped in the faithful discharge of their responsible and important duties by being required, in addition, to attend to haulage, pumps, and various other matters with the result that often their duties at the working face have been neglected. It now is to be made law that this official shall "devote his whole time to his inspections duties," the exceptions being only "where the duties assigned to or undertaken by him in addition to his inspection duties are not such as prevent him carrying out his inspection duties in a thorough manner." It is laid down too that this "shall not prevent the fireman being employed in measuring the work done by persons in his district, or in firing shots in his district, nor shall this provision apply in respect of any mine in which the total number of persons employed underground at one time does not exceed thirty." It further is provided that "where any question arises as to whether any additional duties are such as to prevent a fireman carrying out his inspection duties in a thorough manner, the inspector of the district shall decide the question, and his decision shall be final."

Dangerous Gas.

One of the most vital of the amendments from the viewpoint of the mines and of the miners is that which states that, where the mine air in any working placing is found to contain from 2½ per cent. and upwards of inflammable gas it shall be deemed dangerous and the men forthwith withdrawn. The Coal Mines Regulation Act now reads that at any time that the air is found by the person for the time being in charge to be dangerous the miners shall be withdrawn. Thus, it is left to the individual judgment of one person to decide what is, or what is not the danger point. That is considered to be too indefinite and to leave too great responsibility on the shoulders of an official. Therefore, it is proposed, as has been done in Great Britain, to fix a definite withdrawal point. It may be said, incidentally, that the percentage named as that at which danger commences has been applied by the Department of mines, under agreement with the Crowsnest Pass Collieries, to the latter coal field for some time.

Safety Lamps.

Then comes the amendment which, it is thought, will mean the introduction of safety lamps in practically all the coal mines of the province. Such lamps, it is stated, shall be used, and none other, "in any mine where the air current in the return airway from any ventilating district in the mine is found normally to contain more than one-half of one per cent of inflammable gas." The wording then goes on to take in that of the Coal Mines Regulation Act as it now reads to the effect that such lamps must be used in every approach to any places where there is likely to be an accumulation of gas. The method to be adopted in fixing the percentage of inflammable gas in this case is the same as that already detailed.

In addition to this provision is made against any possibility of argument or misunderstanding as to how the percentage of gas in mine air is to be arrived at by the following sub-section: "The average percentage of inflammable gas found in six samples of air taken in the air-current in the return airway from the ventilating district at intervals of not less than two weeks shall, for the purpose of this section, be deemed to be the percentage of inflammable gas normally contained in the air current."

Care of Winding Ropes.

The provision that "every winding-rope shall be given a bath in hot oil before being installed; that every winding-rope shall be re-capped at intervals of not more than six months, and that no winding-rope which has been in use for more than two years or which has been spliced shall be used for raising or lowering persons" no doubt is the direct result of the lamentable accident of last September at Protection shaft, Western Fuel Company, Nanaimo, when a number of miners lost their lives through the breaking of a cable. The verdict of the Coroner's jury, it will be recalled, was that

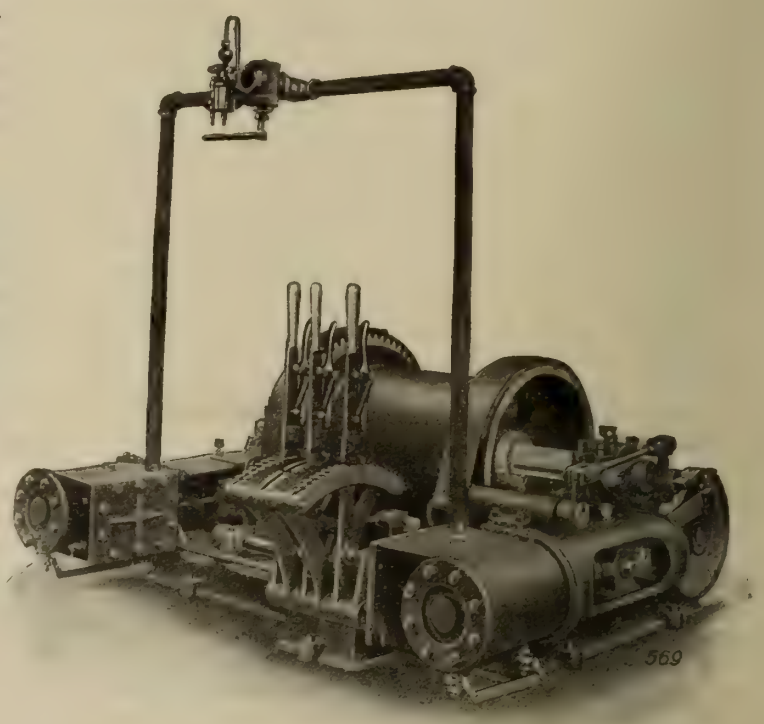
the evidence indicated that the cause of this break was internal corrosion, the primary cause of which was lack of lubrication. It is proposed, therefore, that no cable shall be without proper attention in this respect hereafter. Not only is this safeguard to be provided, but no cable is to be used for more than two years for raising or lowering persons. The question of the life of a steel cable is a matter which has been under discussion with no result for many years. Men of the highest technical qualifications have made investigation, but there is no fixed standard as to the life of such cables yet arrived at. In Great Britain they may be used for three years and six months, so that British Columbia is increasing what is considered an adequate margin of safety there by one and one-half years.

To try and prevent crystalization of chains it also is provided that "all cage-chains in general use shall be annealed once at least in every six months, and detaching hooks shall be cleansed and refitted once in every three months."

THE CIRCO HOISTING ENGINE.

The Canadian Ingersoll-Rand Company has recently re-designed its line of hoisting engines, taking advantage of its winch engine experience to incorporate in hoisting engine some of the features found to be of advantage in winch engine design.

One of the principal features borrowed from winch engine practice, and applied to the hoisting engine is the frame, having cylinders cast separately. With this construction, cylinders are now made interchangeable right and left, and one spare only need be carried for either side. The frame has been strengthened, and is neater and more compact than the older designs. Cylinders are provided with top and bottom exhaust; for steam drive either top or bottom is used as may be more convenient. Each cylinder is provided as usual with two drain valves; a little convenience that will be appreciated being a centrally located quadrant lever operating the four drain valves together.



As will be seen from the illustration the hoisting engine has bored guides; the advantages of this construction are numerous — crosshead guides are bored and end of frame faced at the same time, giving accurate alignment, stress is more evenly distributed, lubrication is easier, etc. Crossheads have adjustable shoes, piston rods are screwed into crossheads and secured by heavy check nuts. Conecting rods are of forged steel of the solid end type, eccentrics and eccentric rods of locomotive type, gear and pinion of semi-steel. The drum-shaft bearing and pillow-block are cast separately from the frame, the advantages of this type of construction being more accurate alignment and greater ease in lifting out the drum when necessary. The cranks are of the counterbalanced disc type, pressed on the shaft, discs being finished and pin holes bored after the discs are pressed on.

SAINT LOUIS FUR EXCHANGE BUYS DIRECT FROM TRAPPER.

Due to certain complaints being brought to the notice of the St. Louis Fur Exchange, 7th and Chestnut Streets, St. Louis, Missouri, U.S.A., of unsatisfactory grading of furs as made by some of the advertising fur houses of that market, where in January over ten million dollars worth of furs were sold, they are now also receiving shipments of furs from the trapper direct, and are recognized and registered under license P.B.F. 30 with the U. S. War Trade Board and all of the Collectors of Customs, thus insuring free passage of furs when addressed to them with the words, "Raw furs of Canadian Origin" on the package or shipping tag. Their advertisement appears on page 17.

TO ASK DOMINION GOVERNMENT.

At a meeting of Associated Boards of Trade of Eastern British Columbia, held at Revelstoke, B.C., the Nelson Board of Trade introduced the following resolution, which was endorsed by the Convention:

"That the Dominion Government be requested to erect and operate plants for testing and concentrating mineral ores."

This is a good movement to get behind and push.—F. E. Payson.

Trail, B.C.—New shippers this year to the Trail Smeltery are the B.C. Mine, of Eholt, with 60 tons and the Silver Standard of New Hazelton, with 80 tons.

Convention Exhibition

As will be seen from the following the public will have a chance to see some exhibits in connection with the Mining industry which have never been placed on exhibition in Vancouver before:

Apart from mining operators and those who are otherwise identified with mining, few persons have ever seen a flotation plant or a concentrator in actual operation. These two pieces of machinery will be on exhibition at the display of ores and other things in connection with the International Mining convention which will be held in Vancouver on March 17, 18 and 19 next. The exhibition, as has already been stated, will be in the basement of the Vancouver building which will be brilliantly illuminated and in which there are over 5,000 square feet of floor space.

Arrangements have been completed for the installation of these machines and delegates to the convention will be given the unique opportunity of seeing them at work on the three days that convention is sitting. Considerable expense is being incurred by the Chamber to make this display the most comprehensive and up-to-date that it is possible to do. Applications for the display of exhibits must be made to Mr. S. J. Crocker of the B. C. Equipment Company, Vancouver or to the Secretary of the Chamber of Mines.

While the list of exhibits is not ready yet, it can be said that everything essential to the mining industry will be on view. This will include specimens of ore from gold to iron, bars of pig-iron, samples of galens and every ore indigenous to British Columbia. In addition to the ores and machinery there will be a large display of trucks suitable for mining purposes. Inquiries that have been received would indicate that the exhibits will not be confined to B. C. though preference will be given to the local articles.

The chairman of the exhibition committee hopes to be in a position to give a complete list of the exhibits within a week or ten days, so that delegates coming from a distance will have an opportunity of becoming acquainted in a measure with what they are going to see when they arrive in Vancouver. It is sufficient to make this exhibition the success it is certain to be, and that nothing will be missing that will tend to place it in the front ranks of exhibitions, if not the premier position of similar displays in British Columbia or Canada for that matter.

We Are After Them. — They Are Coming.

The reports that are being received from the members of the committee who have undertaken extensive itineraries throughout various parts of the Province and down south are of most encouraging character. All of them point to the attendance being on an unprecedented scale, embracing representatives of some of the largest mining corporations in the United States and Eastern Canada as well as the most eminent engineers and geologists. Mining men from B. C. who have been as far south as California and have gone into Colorado and Montana have brought back reports to the effect that in every center they visited, British Columbia's International Mining Convention was the one theme of conversation among the mining men. It is clear therefore that the efforts that have been made to embrace as large an area of country as possible in the convention have met with unqualified success.

There Will Be a Programme Worth While.

Dr. Edwin T. Hodge, chairman of the programme committee, is busy arranging the details of the various sessions and the subjects that will be discussed. Dr. Hodge, who is one of the foremost geologists and mineralogists in British Columbia, is in close touch with the men best qualified to speak on the different topics that will be scheduled for consideration and is hopeful of securing the services of men whose names are household words in the mining world both in Canada and the United States. As a matter of fact from invitation which has been extended to these men to visit Vancouver in the third week of March and, combined with the fact that the six Government District engineers of B. C. will be on the list of speakers, it will be seen that the quality of the information will be of a very high order indeed.

The fact that the district engineers will give reports on their districts should possess an unusual attraction for the up-country and interior delegates, any of whom will be put into personal contact with those officials on request, so that, if necessary, they can secure information which may not be publicly given, concerning their claims or other claims in which they may have an interest. This is a matter which those delegates should not lose sight of and make their arrangements accordingly.

A new Bill introduced in the B. C. Legislature on February 20th by the Honorable William Sloane, Minister of Mines, contemplates the creation of a Board comprising the chief inspector of mines, a representative of the mine owners and one of the coal miners.

This board will have power to apportion the Province into minimum wage Districts, to fix the wage in each District and set various conditions. All board orders will be subject to the approval of the Minister.

The abolishment of the present Board of Examiners for Mine Officials is contemplated and a Board comprising the chief inspector of mines with representatives of men and owners who will deal with the examination, not only of the mine official, but also the working miners; examinations to be held every two months. It is said this provision is made to watch more closely the employment of aliens.

The duties of fire boss are more closely defined and the protection of mines is also dealt with in the new Bill. It is to be considered dangerous if a place in a mine is found to have more than two and a half percent. of inflammable gas. Every six months every cage chains must be annealed, every three months detaching hooks must be cleaned. A hot oil bath must be given the winding ropes before installation and must be recapped every three months and must not be used more than three years for the raising and lowering of persons.

The Bill had its first reading.

VISITORS TO THE CONVENTION.

The Canadian Mining Journal, Pacific Coast Branch, F. E. Payson, Pacific Coast Manager, 507 Board of Trade Building, wishes to extend to you a hearty invitation to make every use of our office.

You will find telephone, comfortable chairs, stationary and a stenographer and we want you to make yourselves right at home.

We are doing our part to make this Convention a great succes and we hope that you will make every use of our hospitality.

PREPARATIONS RAPIDLY CRYSTALLIZED FOR THE INTERNATIONAL MINING CONVENTION AT VANCOUVER.

On March the 17, 18, 19, there will be a real live International Mining Convention held in Vancouver. There will be present at the Convention Mining Engineers and Geologists of great prominence from both Canada and the United States. There is a bare possibility that Dean Frank H. Probert of the University of California will be present. Dean Probert is now looking over mines in France and Belgium, but if he returns in time his secretary writes that he will be glad to take part in the proceedings.

President A. M. Whiteside of the Chamber of Mines, has been to Spokane to arrange for the sending of a large delegation from that District and it is expected that the Spokane District will be well represented.

The Committee in charge of the arrangements for the Convention are as follows: Advisory council, A. M. Whiteside, N. Thompson, E. T. Hodge, J. M. Lay and H. P. McCraney, Programme, E. T. Hodge, Ald. Woodside, H. P. McCraney, W. E. Bland and H. A. Turner. Exhibition, S. J. Crocker, R. H. Stewart, G. W. Pettapiece, E. T. Hodge and T. H. Crosby. Entertainment, A. Erskin Smith. Trip, I. Thomas, S. W. Miller and G. S. Craddock. Transportation, B. G. Hawkins and G. S. Eldridge. Publicity director, T. J. McIlveen. Resolutions, A. M. Whiteside, J. M. Turnbull, C. K. Campbell, Jas. Anderson (Kaslo), J. J. Warren (Trail), G. W. Wooster (Granby), and J. W. D. Moody (Britannia). Co-operation, A. M. Whiteside, Sidney (Spokane), Editor Alaska Mining Journal (Seattle), F. Starkey (Nelson), T. K. Rickard (San Francisco), and R. P. Whittaker (Denver).

VANCOUVER B. C. THE MECCA.

Seattle men are coming to the Convention about one hundred and fifty strong. President Sazullo of the University of Washington will be here. Any mining man that can get to Vancouver for March 17, 18, 19 and does not do so will miss something worth while.

Come if you can and get in touch with the big men in the mining world.

THE PAS RECORDING OFFICE.

(From "The Pas Herald.")

The Pas, Feb. 15.—The following is a copy of the wire sent to Hon. Arthur Meighen by ex-Governor Charles R. Miller of Delaware, and vice-president of the Mandy Mining company. The wire is self-ex planatory:

572 Bullitt Building,
Philadelphia, Pa., Feb. 3, 1919.

Hon. Arthur Meighen, Minister of the Interior, Dominion of Canada, Ottawa, Ontario, Canada:

We are advised of contemplated removal of mining recording office from The Pas to Dauphin, Manitoba. As The Pas is situated at the extreme southern limit of mining territory in Manitoba, removing this office to Dauphin would place it three hundred miles still further away from the mining to a section where there is absolutely no possibility of mining. This would impose delays in recording, great increase in travelling expenses, and serious inconvenience. We, therefore, most respectfully and earnestly request that the office be permitted to remain located at The Pas.

MANDY MINING COMPANY,
CHAS. R. MILLER,
Vice-President.

Mayor Finger and President Jacobsen sent a joint wire to Mr. Meighen in reply to his letter, received on Saturday last, wherein he says that a sub-agency at The Pas will prove very satisfactory, because it will have direct communication with the department. This joint wire was vigorously worded, and emphasized the absolute necessity of leaving the mining books here.

Mr. Meighen's letter to the Mayor reads:

Ottawa, Ontario,
Feb. 3rd, 1919.

Dear Mayor Finger:

Your telegram has just reached me regarding the agency of Dominion Lands at The Pas.

While the agency office at The Pas is being discontinued, it is not my intention to close up the office altogether. It will be in the future a sub-agency, and the sub-agent will be the medium of approach to the department, with the result that the people of that district will not be very greatly handicapped.

I might state that the closing of many of the agency offices in Western Canada was only done after careful consideration of the matter, and on the recommendations of the officers of the department from whom reports were received.

I feel confident that, in view of what has occurred in other districts similarly affected, the people will, before long, be quite satisfied with the action taken.

Yours very truly,
ARTHUR MEIGHEN.

The Pas, February 8th, 1919.

Hon. Arthur Meighen, Minister of the Interior, Ottawa:

Sir,—Your letter of the 3rd inst. We again protest against closing of agency of public lands at The Pas. The whole population of New Manitoba consider such action as a rank injustice to the district, as seriously detrimental to the development of the rich mineral resources. A sub-agency will not serve the prospector. He cannot afford to travel 600 miles whenever necessary to examine record. Your action in closing the office is reactionary in the highest degree. It will mean no development here, and is in direct contradiction of the government's avowed policy of reconstruction.

O. H. FINGER,
Mayor of The Pas.
J. P. JACOBSEN,
President of the Board of Trade.

Nelson, B.C., Ore Testing Plant for British Columbia.

That an effort will be made at the forthcoming session of the Dominion House of Commons to induce the Government to vote a sufficient sum to enable the establishment in British Columbia of an ore testing plant was announced by R. F. Green, M.P., for Nelson, B.C., at a meeting held in the latter city before he left for the Capital. He said that he was convinced of the need for such a plant, and he believed that it should be established at or near Nelson because, in his opinion, the Kootenays were the chief mining districts of the Province. Whether he would be able to convince the authorities on the latter point, however, was a question. The argument used in favor of Vancouver was that it could be reached by both rail and water and that, therefore, from the transportation point of view a plant in that city or in the adjacent district would best serve the whole of the Province. Mr. Green asked the support of Kootenay mining men in the effort to secure the plant for that part of British Columbia.

Special Correspondence

NORTHERN ONTARIO.

Porcupine V. N. T. Development Program.

Announcement has just been made that arrangements were recently completed for the carrying out of the development program outlined just prior to the outbreak of war, and which have been held in abeyance since that time, on the Porcupine V. N. T. Property. The company was formed by the amalgamation of the Porcupine Vipond and North Thompson, each of which had a capitalization of one and a half million shares of par value of one dollar per share. After the transfer of the old stock issue was made, approximately 750,000 shares of the capital stock of the company remained in the treasury. The development plans of the company included the sinking of the main shaft at the mine from its present depth of 600-ft. to 800-ft., with provision being made for the continuing of this working to a depth of 1,000 ft. Enlargement of the present 100-ton mill was also under consideration and plans have been prepared for increasing the capacity of the milling plant to 300 tons per day. The site chosen for the new mill is on the North Thompson side of the property. The average grade of the ore developed in the mine has shown a tendency to increase as depth is attained and, it is estimated, the ore so far blocked out will average around $10 per ton. The vein at the 600-ft. level was found to have a width of about twenty feet in places and some of the richest ore in the mine has been obtained at this level. The property is bounded on the north by the Hollinger and on the west by the Porcupine Crown mine. The outlook for the future of the mine is exceedingly bright.

Another 40 Stamps at Hollinger.

A striking example of the speeding up of operations in the production of gold in the Porcupine camp is the fact that on the first of March the Hollinger-Consolidated mining company added another forty stamps to the already large battery of ore crushers. Each stamp crushes fifteen and a half tons of ore every twenty-four hours, thus the capacity of the plant will be increased by about 620 tons per day. During 1918 the mill treated 1,900 tons daily while only running at 64 per cent. of the possible running time. It is estimated that with the pressing into use of the additional forty stamps the output of the mine will be increased about $170,000 per month. Large additional working forces are being taken on at the property and an extensive resumption of development work at the lower levels of the mine is said to be contemplated for the near future. Among other additions scheduled to be made to the plant is the installation of a 1,000 horse-power hoist and an additional 9,000-ft. compressor. During the year 1918, in spite of the great shortage of labor and high costs of production, the Hollinger-Consolidated turned out about $6,000,000 in gold bullion and developed upwards of six and a half million dollars worth of new ore, thus increasing the ore reserves by the end of the year by upwards of half a million dollars. Thus with operations making rapid headway to soon exceed the pre-war rate, it is probable the current year's production will greatly exceed that of any other similar period in the history of the great mine. It is freely predicted that many surprises are in store for the shareholders of the premier gold mine of the Dominion.

Dome.

According to late information regarding Dome Mines, it is planned to resume operations early in April, however, operations at full capacity will not be under way until the middle of May. A number of new men are being taken on at the property and underground development work on a fairly extensive scale is being proceeded with underground, being centralized in the connecting of the eight hundred and seven hundred foot levels. The financial situation of the company may be summarized as follows: — At the close of 1917 the company had a surplus of $531,948. At the end of October, 1918, the surplus was given as $265,-018, thus showing a decrease of $266,930 for the ten months. This decrease in the cash reserve was caused by the large amount of development work carried out during the period in which the mill has remained closed. It is thought the present cash surplus will be sufficient to carry the company over until the mill is again in full operations.

Silver Alliance.

The syndicate now in control of the Silver Alliance property, near Elk Lake is installing a steam plant, and it is expected mining operations will be under way in the next two weeks. A small shaft has been sunk on a vein uncovered some time ago and drifting will be proceeded with as soon as possible.

Will Improve Gowganda Road.

The Ontario Provincial Government has officially announced its intention of improving the Gowganda road, as soon as weather conditions will permit. The work will be taken up from the point where it was left off last fall, and the plans call for the expenditure of a considerable sum.

T. & N. O. Extensions.

It is reported the situation regarding the Kirkland Lake district is also being inquired into by the Government. It is stated in well-informed circles that there is a strong probability of an extension of the T. & N. O. being built this summer from Swastika to the centre of activity at Kirkland Lake, a distance of about five miles.

At the same time announcement is forthcoming to the effect that the T. & N. O. railway will push the Porcupine branch through to Mattagami Heights on the Mattagami river, at which point the Commission will construct a dock and storehouses. A steel bridge is being built over the river at the point, which will provide through traffic from Timmins to the township of Mount Joy, and the splendid country beyond.

The Government will also proceed with the construction of a roadway from the Boston Creek station to the centre of activity in the district. The Boston Creek district appears to be in line for extensive new activities during the coming spring and summer months, and the properties in an advanced stage of development are more than meeting the expectations of their interested owners.

Alexo.

During the third week in February the Alexo Mining company shipped 400,000 pounds of nickel ore. This brings the shipments for the month of February up to 1,080,000 pounds and with another week to go, it is expected the month's record will be big.

Miller-Independence.

The plans of development of the Miller-Independence property the main operation of the Boston camp to date has undergone a considerable change during the past week or ten days. In place of continuing the in-

cline shaft to a depth of 500-ft. it has been arranged to sink the central shaft some distance south of the vein. This shaft will be driven vertically to a depth of 550 or 600 ft., at which point it should encounter the vein, which is dipping at an angle of between fifty and sixty degrees. At a depth of 300-ft. a station will be cut and a crosscut driven north to the ore body, while at the 600-ft. level the vein will probably have dipped sufficiently to necessitate a crosscut to the south, later on as the shaft attains greater depth crosscutting will be carried on to tap the vein at the various levels. Sinking operations on the new central shaft were commenced to-day, and it is expected rapid headway will be made with the working.

Diamond Drilling Cotter Property.

The official figures given out on the results of diamond drilling on the Cotter property at Boston Creek, show that in a hole driven a distance of about 720-ft., dipping in an angle to the north, an orebody measuring over twenty-eight feet in width was cut at a vertical depth of 492 feet. The average gold content of vein matte amounted to $12.40 per ton. It is firmly believed this orebody is the eastward continuation of the main vein of the Miller-Independence property, and very strongly indicates that the orebody is increasing in width as depth is attained.

Boston Creek Properties Sold.

Two important mining deals were closed this week in the Boston Creek district. The McCrea-O'Neil property and the Charlebois-Authier were the ones figuring in the deals. The former property was sold for cash, the full purchase price being paid this week through the Royal Bank at Haileybury. The vendor retains a small interest in the property. A substantial cash payment was made on the Charlebois-Authier.

The McCrea-O'Neil property adjoins the Miller-Independence on the northwest. The Charlebois-Authier property adjoins the Cullen-Renaud on the North, lying between the latter property and the Boston Gold Leaf mine.

Working forces are being engaged at once and the erection of camp buildings will be completed before the spring arrives, which will be followed by an aggressive campaign of development. The purchasers of both properties George Morris of Allan and Morris, Building Contractors of Buffalo. It is also understood that E. L. Wettalufer of Buffalo is associated with the purchasers.

Canadian Kirkland.

A small steam plant is being taken in to the Canadian Kirkland Gold Mines property, preparatory to the commencement of more extensive development work. Owing to the death of Mr. George E. Drummond of Montreal, the date of commencing mining operations has been temporarily deferred, but the delay is expected to be of short duration. An interesting feature in connection with the Canadian Kirkland property is the fact that where commercial ore has been developed, the ore has been found to contain greater values in silver than in gold. While each of the mines in Kirkland Lake camp produce a good deal of silver, sometimes amounting to as much as ten per cent., there appears to be no other instance on record in the camp where such a high percentage of silver is contained in the ore.

Adanac.

The Adanac Mining company has just completed the shipment of another 100 tons of ore to the Dominion Reduction plant at Cobalt for treatment, this shipment is just double the size of the one recently made. As the ore was broken a good deal of high grade was bagged and the shipment just made is expected to be of a medium grade, the former shipment of very similar ore having averaged close to $50 per ton. The high grade bagged, of which there was a considerable quantity will be disposed of later. In the meantime the ore deposition is being found to be more extensive than was at first supposed and as stopping operations are continued it is becoming more and more apparent that a big future is opening up for the Adanac.

BRITISH COLUMBIA.

The Vancouver Convention.

Dean Frank H. Probert, of the University of California, is mentioned as likely to be one of the distinguished visitors to Vancouver, B.C., on the occasion of the International Mining Convention which takes place from the 17th to the 19th of March next. Dean Probert now is making a tour of the devastated areas of France and Belgium and, if he is back in time, will be among the delegates to this Province from the United States. His reputation as a mining authority and the information he will have obtained of conditions in Europe with reference to the problems that must be faced in regard to reconstruction are two reasons why his attendance is most earnestly sought. Burr Evans, of Placerville, Cal., also has consented to be present. He has stated in a letter to the Convention management that "it is just such Conventions as these that assist the ancient and honorable industry of mining." D. M. Riordan, of San Francisco, Cal., says that he will attend if it is at all possible and, in fact, the word, generally speaking, from California, Oregon and Washington is, that representative mining men of these States intend making a point of coming to the Vancouver Convention in force. Mr. A. M. Whiteside, chairman of the B. C. Chamber of Mines, has returned from a trip to Spokane, Wn., and reports that the Convention to have been held at that city has been called off in order that the mining fraternity of that district, as well of all the neighboring states, may throw their considerable influence into making the Conventions of Vancouver and of Nelson, B.C., a success. John D. Kearns, one of the management committee, has left for California in order to get in personal touch with the mining men of the South and of the Northwest, to the end that strong delegations may be assured and also to arrange for mineral exhibits. Nichol Thompson, another member of the committee, is going North to see that a representative assortment of exhibits are sent from Northern British Columbia districts and to enlist the support of those connected with the mining industry in those sections. In the Provincial Interior H. P. McCraney is engaged on the same business. Approximately five thousand feet of floor space is being devoted to exhibition uses. The intention is that the exhibits shall include samples of every species of British Columbia ore as well as of as complete a display of machinery incidental to mining as possible.

Ask British Columbia Government to Develop Water Power.

The effort to secure the establishment of an iron and steel industry in British Columbia has been stimulated by the report of Dr. Alfred Stansfield, of McGill University, on the feasibility of electrically treating the

magnetite ores of the Province. It has been pointed out by the members of the Legislative Assembly, as well as by local organizations formed solely for the purpose of bringing about the foundation of the industry, that the one difficulty in the way is the securing of an adequate supply of power at a rate that will make the economic treatment of the ores practicable. The answer to this is that British Columbia has plenty of water power, and that some of it should be reserved by the Government without loss of time pending the obtaining of sufficient financial backing to permit the harnessing of some of it.

This is the sum and substance of a resolution recently passed by what is known as the Victoria Re-Construction Group of the Board of Trade and the Central Iron Committee, and which follows:

"Whereas the greatest handicap in the securing of new industries for the Province of British Columbia is the difficulty of obtaining adequate power at reasonable cost;

"And whereas in the Province of British Columbia are water power capable of development for the purpose of electrical energy;

"And whereas the development and control of water powers in the Province of Ontario has been a great financial success;

"Therefore be it resolved by this joint meeting of the Victoria Reconstruction Group and the Central Iron Committee that the Government be asked to immediately place reserves upon some of the existing water powers in the Province and that they take steps for the immediate development of at least one of these water powers, having in view the absolute necessity for cheap electrical power, if a great iron and steel industry is to be developed in this Province."

The matter of providing for the development of the ore is dealt with in the following resolution:

"Whereas the Government of the Province of British Columbia has passed an Act granting a bounty upon pig iron manufactured in the Province from ores produced in said Province;

"And whereas most of the iron deposits are held in the hands of private owners, many of whom are unwilling, or owing to financial conditions, are unable to develop the same;

"And whereas it is essential in order to get an iron industry established that an adequate supply of ore should be obtainable on a reasonable basis so as to prevent the failure of such plants or plant on account of shortage of ore;

Therefore be it resolved by this joint meeting of the Victoria Re-construction Group and the Central Iron Committe, that the Government of the Province of British Columbia be asked to take measures at the present session of the Legislature to assure an adequate supply of ore to any iron plants that may be established and to take power to enter into mines and to remove iron ore from any claim in the Province, safeguarding the owners of such claims by payment of an adequate per ton royalty and further safeguarding them against the possibilities of labor liens or other indebtedness not contracted by the said owners."

Hon. Wm. Sloan, Minister of Mines, is giving the matters thus dealt with his consideration and also is giving attention to other representations made with a view to facilitating the early inauguration of the iron industry in the Northwest.

Exemption from Regulations.

"An Act to Amend the Allied Forces Exemption Act" has been presented to the British Columbia Legislature by Hon. Wm. Sloan, Minister of Mines. It provides for a further extension of the privileges of exemption from certain of the mining regulations of the Province, to members of the allied forces. Protection under the present Act is furnished soldiers and sailors who are with the colors "during the continuance of the present war and for a period of six months thereafter." The amendment the Minister proposes will change this to read "until the 31st day of March, 1920." The reason for this is simple. If a formal peace treaty were to be signed in April or May, protection to mining men of the Province would continue only until the month of October or November following. It would be impossible to extend the provisions of the Act then because the legislature does not meet until the next January and February. Thus it might be that many cases would develop where men, properly entitled to exemption, would not be returned to civil life in time to take up their mining obligations and it would be outside the power of the Government, without the endorsation of the Legislature, to provide the necessary relief. The further extension, therefore, is proposed with a view to anticipating any such possibility. It may be said by way of explanation that the Allied Forces Act of British Columbia applies to any person who, since August 1914, has joined for service in the present war, whether by voluntary enlistment or through being mobilized; it provides that the man's Free Miner's License, the legal rock upon which all his mining holdings stand, shall be continued in force; that the soldier's assessment work on any claims he may possess shall be deemed to have been done; and that it provides for the laying over of Placer Mining Claims and Placer Mining Leases or interests therein held by members of the Allied Forces, In short, it stipulates that there shall be a general suspension of the ordinary mining regulations insofar as the interests of men who left to fight the battles of the country are concerned.

Ainsworth and Slocan. — The Standard Mine is maintaining about 25 men on development. The Standard Mill is operating on one shift basis and is handling ore from the Echo Mine. The Silver Bell Mine situated on the south fork of Kaslo Creek has made an initial shipment of high grade ore. Reports from the Silversmith Mine, Sandon, are that the ore, which gave signs of pinching out, is showing up again and prospects are brighter. The concentrating plant at Alamo, which has been re-built by Clarence Cunningham, is expected to be ready for operation by the 1st of March. Development proceeds on the Wakefield Mine above Silverton, recently acquired by Mr. Cunningham. Some high grade galena is said to have been shown up, and a shipment of one car of ore has been made. Armstrong & Casey, who have a lease on the Galena Farm Mine, have developed some good ore and the intention is to re-open the mill as soon as it is overhauled and water becomes available. F. R. Wolfe, president of the Florence Silver Mining Co., recently paid one of his regular visits to the Florence Mine, Princess Creek. He is quoted as saying that the future of the property commercially depends altogether on the price of lead. The values of the ore are almost entirely lead, but if the price remains as it is, notwithstanding that it is very low in comparison with production costs, he thinks

there will be no difficulty in maintaining operations, production and dividends. Any further drop, however, would mean a curtailment in production. The re-built Ivanhoe Mill, which has been steadily operated for some time by the Rosebery-Surprise Mining Co., has been closed and the mill at Rosebery will be used for concentration of the ores of both the Bosun and Surprise properties. About three cars a month are being taken from the Bosun, but this apparently is not sufficient to keep the Rosebery mill going. There is not a large tonnage of milling ore at the Ivanhoe Mine at present and considerable development must be done on both the Canadian and Odams groups before regular shipments may be looked for from these sources.

NEW BRUNSWICK COAL MINES CLOSED.

Fredericton, February 21.—Practically all the coal mines in the Grand Lake mining field have been closed because of the unsatisfactory condition of the coal market.

Some 500 or more men have been thrown out of work in the vicinity of Minto alone, and the only mines that are now running are those of the Minto Coal Company.

All that keeps the Minto Coal Company's mines in operation is the fact that the company has large contracts with the Canadian Pacific Railway. The Provincial Government has asked the Federal Labor Department to arrange to have the output of other mines used on the Canadian National Railways in order to make it possible for them to operate.

COST OF COAL ON PACIFIC COAST.

Interrogated in the British Columbia Legislature as to the reason for what was alleged to be the excessive price of coal on the Pacific Coast, and particularly in this Province, Hon. Wm. Sloan, Minister of Mines, retorted a few days ago that, while the cost of coal in the Canadian West might be higher now than in past years, it had become so for reasons over which the Provincial Government had no control. Production charges had risen, and the collieries, he understood, had been forced to advance prices in order to avoid making a loss on their operations. The Provincial Government, however, have no jurisdiction in the matter. Prices to the consumer was a matter which the Dominion Government, through the Fuel Control Department, had dealt with during the War, and, as a result of an investigation into the affairs of the collieries of Vancouver Island, the latter had been given authority, in all save one case, to increase their selling rates in order that they might obtain that reasonable profit to which the investment represented by their plants entitled them. Even as conditions were, however, British Columbians and residents of the Pacific Coast generally were not badly off when quotations from other countries were considered, and in elaborating this point Mr. Sloan quoted some interesting comparative figures which follow:

Grade.	Vancouver Island.	Newcastle on Tyne.	Seaham England.	Cardiff, Wales.	Fife, Scotland.	Cumberland, England.	Dublin, Ireland.	Belfast, Ireland.
Domestic lump, best	$7.16	$20.85	$21.87	$7.98	$19.44	$7.91	$18.75	$13.44
Do., nut, second	5.40	15.80	18.22	7.74	8.50	6.82	12.96	13.20
Steam bunker, lump	7.20	24.30	21.87	9.72	19.44	7.91	....	....
Do., nut	5.97	17.58	19.44	9.32	9.18	....	....	....

BRITISH COLUMBIA COAL PRODUCTION.

The total coal production of the coal mines of British Columbia for the month of January, 1919, was 243,516 tons, which represents an increase of 31,509 tons over the production of the month of December, 1918. There was a drop in output tonnage at the Corbin (B.C.) Colliery, and Princeton (B.C.), Collieries, which was due in the former case to weather conditions, and in the latter to a fire in the mine. The loss would amount to approximately 3,000 tons.

The tonnages produced by districts follows:

	tons.
Vancouver Island	158,327
Crow's Nest Pass	72,128
Nicola-Princeton	12,811
Northern (estimated)	250
	243,516

The tonnages produced by the various collieries are as follows:—

Crow's Nest Pass.

	tons.
Coal Creek Colliery	43,335
Michel Colliery	23,839
Corbin Colliery	4,954
	72,128

Nicola-Princeton.

	tons.
Middlesboro Collieries	7,305
Fleming Coal Company	4,098
Princeton Colliery	983
Coalmont Colliery	425
	12,811
Telkwa, estimated	250

Vancouver Island.

	tons.
Canadian Western Fuel Co., Nanaimo Colliery	64,404
Canadian Colliers (D), Ltd., Comox Colliery	51,666
Canadian Collieries (D), Ltd., Extension Colliery	21,217
Canadian Collieries (D), Ltd., South Wellington Colliery	7,813
Pacific Coast Coal Mines, Morden Colliery	4,541
British Columbia Coal Mining Co., East Wellington Colliery	3,543
Nanoose Collieries, Ltd., Grant Colliery	2,697
Granby Consolidated M. S. & P. Co., Granby No. 1 Colliery	2,446

Grand Forks, B.C.—The aerial tramway, being built from the Rock Candy group (fluorspar), to the spur extension of the Kettle Valley Railway, is almost completed. When it is finished, and the last spike is driven on the railway branch, the transportation of the products of this property, which is being developed by the Consolidated Mining & Smelting Company of Canada, will be materially facilitated.

Use of Cripples in Industry

By JAMES P. MUNROE.*

(A paper presented at New York Meeting, American Institute of Mining Engineers, February, 1919.)

Appalling as has been the loss of life in the last 51 months, there is one slight compensation: no longer will there be in the world a cripple, in the old meaning of the term. Men handicapped by wounds or disease, there will be, unfortunately, and in numbers beyond what the world has known since the wars of Napoleon; but neither they nor the industries from which they were called off to war will be "crippled" in the sense in which both would have been had mankind not learned the lesson of conservation and come to understand that the most important field for such conservation is not in the forests and the mines but among men and women.

From the beginning of the Great War, France, Great Britain, Belgium and most of the other Allies have studied the problem of restoring the soldiers and sailors injured through war to physical and economic efficiency; and from their experiences, especially from that of Canada, the United States has learned much. Consequently, our task of preparing for the return of our disabled men has been easier and, in some ways, more comprehensive than theirs. Complex as are the details of the machinery which the United States has set in motion to take care of the men injured by wounds or disease, the plan itself is simple. Taught by European experience, the Surgeon-General of the Army and the Bureau of Medicine and Surgery of the Navy have provided, on both sides of the Atlantic, every known surgical and medical facility for restoring the injured or diseased man to a physical condition as nearly normal as possible. While in the hospital in France or England, on the transport coming to America, and in the hospital here, the disabled man is incited in every way to believe in his future efficiency, to want to be a normal worker, to desire to retake his place in that society of workers from which he went, temporarily, to do the greater work of preserving civilization. Furthermore, since purposeful occupation is now regarded as an essential form of treatment with most men in the hospital, especially in the convalescing stage, many of these men will have been actually started on the road to earning before they are discharged from the army surgeon's care.

As soon as it is decided that a patient is ready for discharge from the hospital—and, now that hostilities have ceased, from the Army and Navy itself—his case is certified to two bodies: the War Risk Insurance Bureau, which is to determine the amount, if any, of his compensation under the War Risk Act, and the Federal Board for Vocational Education, which stands ready to help him to get back into employment and, if he needs it, to secure a preliminary training that will enable him to make the most of himself, under the conditions of his handicap, in that employment.

The Federal Board has no authority over the man thus placed under its care; it is for him to decide whether or not he wishes to avail himself of the help that the Federal Government thus offers. But if he chooses to use the facilities tendered by the Board, there is almost no limit, within reason, to what that organization may undertake for him. Its simplest task is, of course, to assist him in getting back into his old employment; but if he has ambition to get something better or if it is apparent that, by training, he can be more efficient in what he did before, the Board has authority to give him, at Government expense, as much education as, in its opinion, it is worth while for him to have. Every endeavor will be made to train the disabled man so that not only may his handicap be overcome, but that he may be carried, through an education perhaps denied to him before going to war, to a plane of efficiency which, without this opportunity, he could not have reached. Experience in other countries has shown that, in many instances, the disabled man is, after training and despite his handicap, a much more effective man than he was before the war.

While the disabled soldier or sailor is under no compulsion to take training, there are certain incentives, besides that of ambition, which the Government puts before him. If he desires to be trained and the Federal Board believes that he will profit by it, he is so certified to the War Risk Insurance Bureau, which at once classes him as entitled, during training, to the compensation provided for cases of temporary total disability, and, during the period of training, makes specified allotments to his dependents, should he have them. If he does not pursue the course of training with due diligence, these extra compensations, on representation of the Federal Board, may be withdrawn.

Training will be carried on in public and private schools and colleges and in industrial plants under contracts made between them and the Federal Board. The period of training will be determined to meet the needs of each case, but in every instance the disabled man is to be regarded as a special problem and the instructional work given him will be fitted to his needs. It will be attempted, as far as possible, to obtain for him a position in advance of his being ready for it, so that his training may be focused upon a specific goal. Should it prove, after employment, that his choice was unwise, the Board has authority to give him further training along that, or some new line. Moreover, after placement, whether with or without training, the Board will keep closely in touch with the man until it feels certain that he is firmly established in his industrial, commercial, or professional life.

To carry out the duty placed on it by Congress, the Federal Board has established, or is establishing, headquarters in Washington and thirteen of the other leading cities of the country. As far as possible, the disabled man will be placed and trained in his own State and locality. Every effort will be made to put him into occupations that are growing, and so to train him that, when hard times come and the fervor of patriotism has passed, he will be retained, not because he is a former soldier or sailor but because he is a workman necessary to the work. Care will be taken, moreover, that he is not exploited and that he is not used as an instrument to disturb the labor situation. The complicated problems that might arise, in many States, in connection with employer's liability laws will not come up, since the number of disabled men is happily much less than it seemed probable that the United States would have.

*Vice-chairman, Federal Board for Vocational Education.

The comparative smallness of the problem in the case of men injured in the pursuit of war serves but to emphasize the greatness of the number of men and women injured every year in the pursuit of the activities of peace. By the hundreds of thousands they meet with accident and injury in every degree and form. Heretofore, most of these injured persons, so far as their economic usefulness is concerned, have been thrown on the scrap-heap of society, with anguish to themselves and their relatives, with incalculable loss to the community. The war has taught us that this waste is needless and wrong; and if a bill now before the Congress becomes law, the Federal Board will be charged with providing, in co-operation with the several States, facilities for training and retraining these victims of industry along the same general lines as those followed with the victims of war. The task will be far greater than in the case of the disabled soldiers and sailors; it will not be, as with them, a comparatively temporary responsibility. It will go on forever, as long as there are machines, carelessness, and the inevitable lapses in human minds and senses, and the problem will have many complications that do not arise with those disabled in war. But the effects of rehabilitation in the field of industry will be as much broader in their final results as the scope of the permanent and normal arts of peace is greater than that of the temporary and abnormal art of war.

Employment of Mine Labour

By HERBERT M. WILSON.*

(A paper presented at New York Meeting, American Institute of Mining Engineers, February, 1919.)

This topic was discussed at the meeting in St. Louis in September, 1917, and at the meeting in New York in February last, but in the interval the war has accentuated in measurable degree the necessity for considering human relationship, not only as between nations, or in the treatment of our returning soldiers, but with respect to the relations between labor and capital in industry. It is my firm conviction that no other subject will have so large a place in industrial and political life during the next decade as this.

Heretofore the employer has been so engrossed with the financial, mechanical, and technical aspects of his business that he has been willing to muddle through his relations with labor as best he might, and, on the other hand, the laborer has been so engrossed in his endeavors to secure a livelihood under whatever living and working conditions might be offered him that he has given little thought to his relations to his employer, until some misunderstanding has ended in disagreement and strike. No thinking man doubts that were the machinery available for friendly, personal, face-to-face consideration of the problems confronting employer and employee, there would be fewer disagreements, fewer strikes, and a better and more settled industrial situation.

The necessity for some such medium for exchange of views has resulted in the organiaztion of labor and, in some measure, of capital. Each party, engrossed only in defending its own viewpoint, has generally tried to gain its point by might rather than by right. Gradually, however, the representatives of both elements are beginning to appreciate that when the machinery for bringing them together in friendly communication is available their differences frequently settle themselves. There remain yet vast numbers of employers and of employees who are not organized and to whom the opportunity of friendly discussion of differences is not available; for these the machinery should be provided.

The subject, Employment of Labor, in so far as it applies to mine labor, may be considered under two headings: method of employment of labor and method of retention of labor. The method of treating each of these divisions of the subject will depend on the size of the mining operation. The method of employment for a large operation may be by the maintenance of a separate employment department; for small mines, there may be no employment department or organized method of employment. The method of retention of labor will be affected by the size of the operation, the conditions of employment, as to its possible future permanency, the opportunity for promotion, and the general working and living conditions.

Employment by a large mining operation through a separate employment department should be governed by definite rules and methods. The hiring of labor should be governed by classification, a personal method of interview, and by consideration of the appropriate working place, and other conditions that will affect the prospective employee. The employment and the retention of labor are affected not only by question of wages and chance of promotion, but by the conditions surrounding the work and the working place, and those connected with living opportunities. No aspect of the method of retention of the right kind of employee is more important than that which concerns the living and recreational opportunities offered near the place of employment. These have been generally treated under the titles of Safety Work and Welfare Work; the first deals with the place and conditions of the employment, and the latter with the place and conditions of living. A better knowledge of the effect of these considerations on labor and employment has convinced, without exception, every one of those employers and employees who have had personal experiencs in such matters that an improved condition of safety adds to the efficiency of a mine operation and to the comfort and well-being of the miner; and that good living conditions, including housing and educational and recreational facilities, add in equal measure to the efficiency of the mine operation and to the comfort and well-being of the miner. Both of these so-called activities tend to reduce the cost of production, to increase the earning capacity of the employees, and to make for the more permanent retention of labor, and consequently the preservation of a higher grade of labor.

I will not elaborate now on the effect of safe prac-

Ship to Us Direct

The Top Market Price Paid and Equitable Grading Made

NO DELAYS AT ANY POINT

We are registered with and recognized by the United States War Trade Board and all of the Collectors of Customs under license P.B.F. 30, and you can send your furs to us direct by our tag or any tag, changed to suit, if marked "Furs of Canadian origin" and your furs will come right through.

FAIR GRADING

The rules and ethics of the exchange do not permit of sending out alluring price-lists, yet we give you an exact and expert grading and pay you at a rate of five to twenty-five cents more on the dollar than the average advertising fur company as we cut out all middle-man's profit in dealing direct with you.

ST. LOUIS FUR EXCHANGE, 7th & Chestnut, St. Louis, Mo., U.S.A.

tices in mining on labor employment,[1] nor on the effect of welfare work on labor employment,[2] as my views on these subjects have been given in previous meetings. Other subjects connected with the main topic of labor employment, which I hope will be discussed by those better informed respecting their details, are the methods of separation, their effect on the reduction of labor turnover, and the necessity and wisdom of medical and health examinations both at the time of and during employment, and the relation of this latter inquiry to workmen's compensation costs, which latter subject I have presented in detail before your Section of the International Engineering Congress in San Francisco in 1915.

The question of separation is often one of the most difficult and most full of opportunity for misunderstanding. When either the business conditions or the personality of the employee may require his dismissal, it is necessary to decide how this shall be done in such manner as to make clear not only to the employee but to his associates that his separation is necessary. A common method is by a brusque notice of discharge; a better way would be by giving notice of one or more weeks prior to compulsory dismissal or by a personal interview with an opportunity for voluntary withdrawal within a fixed time.

A great deal of important and constructive work has been done toward the solution of the employment problem by a hundred of the larger mining corporations scattered from the Atlantic to the Pacific, notable among which are the mining subsidiaries of the United States Steel Corporation, the Republic Iron &

Steel Co., Nevada Consolidated Copper Co., Utah Copper Co., Cleveland Cliffs Iron Mining Co., New Jersey Zinc Co., and the Ellsworth Collieries Co. In like manner, among the smaller independent mining operations, there are many that are successfully handling this problem through the personal interest of the owner in the well-being of his employees. In this latter case the problem takes on the older paternal aspect of the subject, wherein the owner lives at his mining operation among his employees and takes a personal interest in them and in their family affairs, thereby securing to them better living and working conditions, and engendering a better spirit of friendly co-operation.

The most pretentious, and I think the most successful, recent effort to solve this problem is that begun three years ago under the personal direction of John D. Rockefeller, Jr., after the labor troubles of the Colorado Fuel & Iron Co. This effort is known as the Colorado Industrial Plan, and its success as a means of bringing about better relations between employer and employees and in securing more permanent and better labor employment conditions, appears to be amply testified to by the results of the past three years of successful operation. It is a striking example of the value of personal friendly conference, through the agency of a permanent establishment for the settlement of employees' troubles. In substance, it consists of a representative committee, selected by the miners and the owners, that meets at regular intervals to hear and inquire into the complaints of employees and the differences between employer and employee at each plant, respecting method of employment, retention, and separation. In the field of retention, this plan has adopted a most liberal attitude toward safe working conditions and satisfactory living conditions. It operates through committees on co-operation and consideration; on safety and accidents; on sanitation, health and housing; and on recreation and education. These committees have accomplished much for the betterment of the working and living conditions of the miners and their families.

THE SILVER MINES.

As the days pass and the governments of Great Britain and United States make no apparent move to lift the regulations which holds the quotations for commercial bar silver below 101½ cents per ounce, it becomes more and more apparent that the regulation is considered a necessity, but for the existence of which the quotations would go higher. Not for even a day since the time the maximum price was set has the quotations for the metal shown the slightest sign of receding, despite the fact that no minimum price has been set. Although the financial condition is so intensely complicated, subjected to influence which are not easy to distinguish in the maze of enormous problems, and although the 'wind' may blow the opposite direction to that generally expected, yet silver mine operator almost to a man can see no impediment to the continuation of the present ruling quotations, and can point out various reasons for believing the price will go higher.

ECHOES FROM C. M. I. ANNUAL.

The boys are all behind the new President and mean to give him a hearty support during his term of office.

Would it not be well to appoint a committee of Inspectors of Mines to consider accidents at each annual meeting?

The provision of safety appliances for mining inspectors might be considered as worthy of the attention of those who have charge of the next convention.

What has become of our old friend Conservation? The coy Research Council appears to have supplanted her in the affections of the members. But 'tis a fickle age!

In his address the Secretary of the Engineering Institute of Canada, Mr. Keith, expressed himself frankly and convincingly. The relations of the two institutes in the future should be most pleasant.

Mr. Dresser proved to be a real find as toast master. While we wish to see him President of the Institute before many years, in the meantime we would suggest to the Council that he be asked to become honorary official toast master.

It's too bad Cambrian was detained in the capital city. His odes in the Bulletin will not have quite the true ring for the next year. He would have found the meeting of 1919 a great inspiration for his muse. He would not need to draw on his imagination.

We believe it was due to the thoughtfulness of that good friend of the Institute, Mr. J. Stevenson Brown, that it was arranged to have the annual dinner in the Montreal Club. The members are much indebted to both the Club and to Mr. Brown. The Club was the pleasantest place in which any of the 21 dinners of the Institute has been held.

And some of the fellows have been infected with bacillum mutabile and want to change C. M. I. to C. I. M. M.! It will take an Act of Parliament to make the change, and to discard a name enshrined in sentiment, loyalty and tradition. But these are nothing—why not "keep up with the Jones"? Change Canadian Mining Institute to Canadian Institute of Mining and Metallurgy! That real mouthful, the new name of the A. I. M. E.—American Institute of Mining and Metallurgical Engineers—should serve as a warning. Then, if we make the change, to be consistent we shall have to insist on numerous other changes. The Department of Mines of the Dominion and of several of the Provinces shall have to become Departments of Mines **and Metallurgy**, with corresponding titles for the Ministers. At last accounts, the Bureau of Mines in Washington has not changed its name.

Weren't the boys glad to see Professor Kemp back again! The reception they gave him when he rose to speak at the dinner was unsurpassed.

Dr. Bradley Stoughton is another whom we all look forward to seeing at the annual gathering. We always knew on which side he was during all the years of the war. The mantle of Raymond has fallen on good shoulders.

Of course the new President of the A. I. M. E., Mr. Winchell, is a real northern zone man, as he comes from Minnesota. We all feel that he is one of us and hope that we shall see him frequently at our annual meetings.

The absence of the Hon. Martin Burrell at the meeting was regretted. Many of his old friends were expecting to see him. But Ministers of the Crown these days have especially heavy duties to perform and have to stick pretty closely to headquarters.

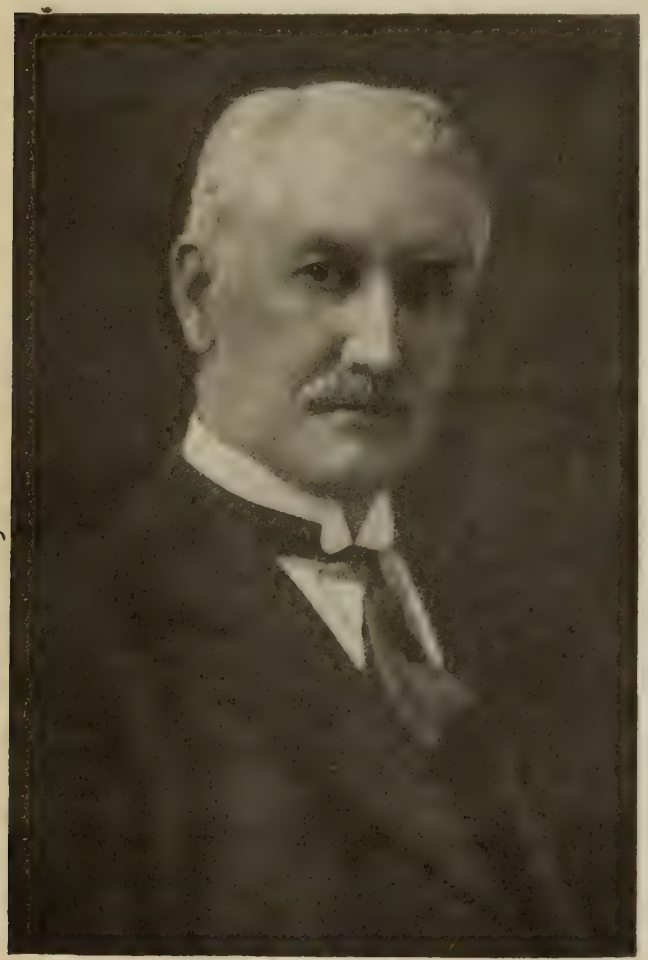
Dr. T. L. Walker of the University of Toronto and Dr. Wm. Goodwin of Queens University in the discussion on the proposal to establish a central research bureau at Ottawa, voiced the opinion of many when they stated that it would be wiser to develop the research work in the Universities. Dr. McCallum seems to be of the opinion that the Universities should concern themselves with non-economic problems. As a matter of fact, research in problems of the mining industry has already been well begun at some of our Universities.

Many regretted that formal statements of mineral production were not made at this meeting, as they have been at each of the preceding twenty annual gatherings of the Institute. According to Mr. McLeish's interesting preliminary report, Canada's mineral production in 1918 increased nearly 11 per cent. over that of 1917 and was worth over $210,000,000, or over $26 per capita, which is most satisfactory. In 1898, the year the Institute was founded, the per capita output was only $7.32; in 1908 it was $13.16. Thus the output per capita has almost doubled each ten years of the Institute's existence. One of the striking increases in Canada's mineral production during recent years is in connection with the prairie provinces. In a comparatively few years, judging from the discoveries that have been made, these provinces will also appear in the annual reports as important metal producers. Less than one hundred miles of the Hudson Bay railway to Port Nelson remain to be completed. It is not too much to hope that, when the great territories surrounding the Bay are made accessible to prospectors, very important mineral deposits will be discovered, and Canada's mineral output will be added to from this source. These territories contain rocks similar to those of the great mineral areas of Ontario, Michigan, Minnesota and other pre-Cambrian fields.

What happened to the talc producer of Madoc?

The description by Capt. L. B. Reynolds of tunneling at the front was for many the most intensely interesting feature of the splendid program. It was midnight before the audience ceased to ask questions.

Dr. Stansfield wants the metallurgists recognized by the inclusion of the word metallurgy in the name of the Mining Institute. Why not call it the Institute of geology, mineralogy, surveying, mapping, sampling and assaying, or the Institute of ore dressing and oil well drilling.



D. B. DOWLING,
Retiring President C. M. I.

Ex-treasurer Brown was very much afraid that our guests would not enjoy the program provided by certain members at the banquet. He pleaded tolerance for the men who so seldom had a chance to get in from the lonely mining districts to such a place as Montreal. He need not have been so specific. The noise producers do not all live at the mines.

The sudden change in market conditions that followed the signing of the armistice, resulted in less keen interest being evidenced in papers on 'war minerals.' A few months ago the papers on chromite by Dr. Robert Harvie and Mr. L. K. Fletcher would have been more interesting. They are, of course, valuable contributions, but, with the demand for chromite gone, the demand for information about chromite is naturally less.

Mr. Norman Fisher was present at the meeting, but comparatively few were aware of the fact. His beautiful mustache is no more.

The French evidently used to good advantage small tunnels about 2 feet by 2 feet. These stand up well when the ground is disturbed by explosions.

As Mr. Gibson says, the value of a mine is determined by the profit it produces and will continue to produce. Taxation based on mine valuation, is therefore in the end based on profits.

The New Zealanders made good records in tunneling at Arras. According to Capt. Reynolds they accomplished wonders in connecting the old galleries. They made tunnels 2 feet wide and 6 feet high.

D. H. McDOUGALL,
President and Manager Nova Scotia Steel & Coal Co.;
President C. M. I.

Professor Guess does not favor changing the name of the Canadian Mining Institute. After his experience with the passport examiner he is satisfied that the average citizen is more familiar with mining than with metallurgy.

Mr. George Mackenzie, the able representative of the Mines Branch who did practically all the work of the Munitions Resources Commission, and who, by the way, has just severed his connection with the Department to undertake the management of a Welland company, gave a well illustrated account of the prospecting work carried on by the Government in British Columbia last summer. The testing of the platinum placers were discontinued some months ago, before Mr. Mackenzie's drilling campaign was completed. Those who follow will find that a good start has been made.

Annual Meeting Canadian Mining Institute

The twenty-first annual meeting of the Canadian Mining Institute was held in the Windsor Hotel, Montreal, March 5 to 7, 1919.

An event of unusual interest was the unveiling of the Institute's "Honor and Service Roll," recording the overseas war services of members. This took place in the Rose Room of the Windsor Hotel on Thursday afternoon, and was an occasion that will long remain in the memories of members of the Institute. The ceremony was performed by Brigadier-General W. O. H. Dodds, C.M.G.

The memorial tablet is a very attractive and serviceable one. The names are engraved on bronze doors, which, when opened, disclose photographs. In a separate compartment are filled records concerning each man. To the secretary, Mr. Mortimer Lamb, belongs the credit for the design, and he is receiving many well deserved compliments. The tablet is to be given the place of honor in the council room at headquarters.

An admirable program was presented at all sessions of the meeting, but undoubtedly the subject that most intensely interested the members was the account of the work of Canadians on the Western front, particularly the work of the tunnelers. The simply told tale of the carefully performed tasks of the tunnelers was greatly appreciated.

The Institute can well be proud of the part its members played in the great struggle on the Western front. They will also profit by the technical experience gained under such unusual circumstances.

The programme for the several sessions was as follows:

WEDNESDAY, MARCH 5TH.

Morning Session: 9.30 a.m. to 1 p.m.

Presidential address by Mr. D. B. Dowling.

Appointment of Scrutineers.

Consideration of proposal to be submitted by Dr. Alfred Stansfield to change the name of the Institute.

(Chairman, Mr. Thos. W. Gibson.)

Discussion of the proposed amendments to the By-Laws.

Afternoon Session: 2.30 p.m. to 6 p.m.

(Chairman, Mr. J. B. Tyrrell.)

Presentation and discussion of the following papers:

"Molybdenum Mining," by Mr. J. C. Murray.

"Flotation Concentration of Molybdenite," by Mr. H. H. Claudet.

"The Production of Ferro-Molybdenum at Orillia," by Mr. B. C. Lamble.

"Occurrences of Chromite," by Capt. J. G. Ross.

"Occurrences of Chromite in Eastern Townships, and the Industrial Outlook," by Dr. Robt. Harvie.

"Concentration of Chromite," by Mr. L. K. Fletcher.

"The New Zinc and Lead Fields of Gaspe Peninsula," by Mr. A. Mailhiot.

"Mining Development in Northern Manitoba," by Dr. R. C. Wallace.

"Some Economic Aspects of the Falcon Lake District, Manitoba," by Mr. J. S. DeLury.

"An Investigation of Certain Canadian Platinum and Manganese Resources," by Mr. G. C. Mackenzie.

Evening Session: 7.30 p.m. to 10 p.m.

(Chairman, the President, Mr. D. B. Dowling.)

"The Operations of the British Forces in Palestine," (an illustrated lecture by Dr. H. M. Ami.)

"The Coronation Gulf Country" (illustrated), by Mr. K. G. Chipman.

"Deposits of Native Copper in the Canadian Arctic" (illustrated), by Mr. J. J. O'Neill.

THURSDAY, MARCH 6TH.

Morning Session: 9.30 a.m. to 1 p.m.

"American Institute Day."

(Chairman, Mr. John E. Hardman.)

Joint discussion with American Institute of Mining Engineers on "Principles of Mine Taxation." The subject will be introduced by Mr. R. C. Allen and Mr. Thos. W. Gibson.

Address by Mr. W. R. Ingalls on "Industrial Co-Operation."

Address by Sir John Willison on "The Re-Adjustment of Industry, with Special Reference to Mining."

2 p.m.:

Unveiling Institute's "Roll of Honour."

The ceremony of unveiling the Institute's "Roll of Honour" was performed by Brigadier-General W. O. H. Dodds, C.M.G.

Afternoon Session: 3 p.m. to 6 p.m.

(Chairman, Dr. J. B. Porter.)

Joint discussion with the American Institute of Mining Engineers on "A Uniform Mining Law for North America." The subject will be introduced by Dr. Jas. F. Kemp.

Joint discussion on "International Co-Operation in Mining." The subject will be introduced by Mr. Horace V. Winchell, President of the American Institute of Mining and Metallurgical Engineers.

"Co-Operation Among Small Mines, with a View to Increasing Efficiency of Operation," by Mr. R. W. Brigstocke.

"The Value of an Investment with Varying Yield," by Dr. A. C. Lane.

Evening Session: 8 to 10 p.m.

Evening entertainment to include moving pictures showing Canadians on the Western front; and addresses on Tunnelling on the Western front by Major R. W. Coulthard, Capt. L. B. Reynolds and other members who have returned from overseas military service.

FRIDAY, MARCH 7TH.

Morning Session: 9.30 a.m. to 1 p.m.

Iron and Steel and Metallurgical Session.

(Chairman, Mr. D. H. McDougall.)

"Some Equipment of a Modern Copper Smelter," by Mr. E. J. Carlyle.

"The Application of Pulverized Fuel in Blast Furnaces," by Messrs. E. P. Mathewson and W. L. Wotherspoon.

"Electric Smelting with Special Reference to Canadian Conditions," by Mr. Robt. M. Keeney.

"Titaniferous Iron Ores," by Dr. W. L. Goodwin.

"Iron Deposits on the Belcher Islands, Hudson Bay," by Dr. E. S. Moore.

Afternoon Session: 2.30 p.m. to 6 p.m.
(Chairman, Mr. Charles Fergie.)

"Internal Corrosion of Wire Cables and a Suggested Method for its Detection," by Mr. W. Fleet Robertson.

"A Scheme for Oiling Wire Cables in Place," by Mr. W. Fleet Robertson.

"Mining Methods at the Granby Company's Copper Mines at Anyox, B.C.", by Mr. E. E. Campbell.

"Mining Methods at the Mond Nickel Company's Mines, Coniston, Ont.," by Mr. Oliver Hall.

"Liquid Fuels, Their Uses, Production, Consumption and Sources in Canada," by Mr. B. F. Haanel.

"Experiments on the Gasoline Content of Natural Gas in Alberta," by Mr. D. B. Dowling.

"Rational Use of Coal for Power and Heat," by Mr. John Blizzard.

"The Use of Explosives for Mining," by Mr. H. Y. Russel.

7.30 p.m.

Annual Dinner in the Montreal Club, Dominion Express Building, St. James St., Montreal.

A few of the papers on the program were not presented. Mr. J. C. Murray, Dr. R. C. Wallace and Mr. J. S. DeLury were not in attendance. Dr. Wallace was taken suddenly ill on his way to the meeting, and spent the week in a Toronto hospital. Members will be pleased to learn that he has recovered sufficiently to allow him to undertake the return trip to The Pas His paper has been printed and was distributed at the meeting.

Mr. R. C. Allen and Dr. A. C. Lane were also unable to be present. Another American, Mr. H. C. Parmelee. managing editor of "Chemical and Metallurgical Engineering," presented a paper not on the program, but which in the opinion of many was one of the best things of the meeting. Mr. Parmelee discussed the industrial problem with unusual ability, and his paper will be a credit to the transactions of the Canadian Mining Institute.

Another absentee was Mr. E. P. Mathewson. The subject of pulverized fuel in blast furnaces was, however, ably presented by Mr. W. L. Wotherspoon. It was particularly gratifying to members to learn that Canadians, members of the Institute, are taking a leading part in the important new development in metallurgical practice. The kindly reference of Mr. Wotherspoon to the influence of the late David Browne in directing his attention to the possibilities of pulverized fuel was appreciated. The work of Mr. Cavers, another Canadian, and of the staff at Copper Cliff was also favorably commented on.

Mr. Fleet Robertson was not present, but his papers were presented, and will be published in due course. The paper of Mr. E. E. Campbell is not yet printed, but is said to be an exceptionally good one.

The proposed amendments to the by-laws did not meet with much opposition. There was little discussion on them. It would seem desirable that more publicity be given to the reasons for making the amendments.

The proposal to change the name of the Canadian Mining Institute to the Canadian Mining and Metallurgical Institute aroused a rather animated discussion. The objection to the proposed change is not that the metallurgists should not be properly recognized, but that there is no more reason for specifying metallurgy in the name of the Institute than for specifying any other branch of the mining industry. As pointed out by Dr. W. G. Miller, we might as well add geology, mineralogy, map making and other branches which are included under the broad term mining.

The papers presented will be published in the bulleting of the Canadian Mining Institute—some have already been published.

The Advisory Council's Program.

The program of the Advisory Council of Scientific and Industrial Research was outlined for members of the Institute by Dr. A. B. McCallum, the chairman of the Council. Considerable objection was aroused by the proposal to establish a central research bureau at Ottawa instead of developing the research departments of the various Universities. It was decided to hold a special session to discuss this proposal, and such was held on Friday morning, contemporaneous with the regular session in another room.

Dr. McCallum, at the special session, went more fully into the proposals and work of the Council, and a discussion in which a large number of members took part followed. Almost all the speakers favored encouraging research in the Universities, the research to be closely linked up with the industries of the several districts. Thus work in textiles might be undertaken at such centres of the textile industry as Toronto and Montreal, while the fishing industry would be looked after by institutions in the Pacific and Atlantic provinces.

Dr. McCallum seemed to favor the idea of having the Universities devote their attention to research in "pure" science, whatever that means. Those who are engaged in mining and metallurgy know that industrial research is being carried on in our leading Universities, and they believe that this should be encouraged rather than discouraged. They look on Dr. McCallum's porposals as an attempt to obtain Government approval for a plan which would make our University research laboratories less useful than they are. According to Dr. McCallum the public will not take their research problems to the Universities. That may be true in some industries; but it is not true of the mining industry. In any event is the Council's proposal designed to increase one's faith in our Universities?

There was this year great interest in the election for president. Mr. D. B. Dowling did not seek re-election and is to be congratulated for thus helping to put in operation what is generally regarded as a most desirable departure—the one year term. It has been so long the practice to keep a president in office for two years that no strong opposition has arisen when a president allowed his name to stand for election for a second term. At the same time there has been a growing impression that it would be better for the Institute to have a new president each year.

We cannot pass this reference to Mr. Dowling without expressing again the sympathy of mining men for him in the loss of his daughter in the influenza epidemic last fall.

To succeed Mr. Dowling two candidates were named: Mr. J. B. Tyrrel, of Toronto, and Mr. D. H. McDougall, of New Glasgow. The supporters of these two candidates did much campaigning, and as a result an unusually heavy vote was polled. The contest, a very friendly one, resulted in the election of Mr. McDougall. After hearing the address of the new president, the supporters of Mr. Tyrrell feel con-

fident that he will endeavor to carry out many of the things for which Mr. Tyrrell stood, and they will give him hearty support. Mr. Tyrrell, at the annual dinner, expressed himself as well satisfied with what Mr. McDougall said in his address. Mr. Tyrrell strongly urged that the Institute should endeavor to play a larger part in the affairs of the Dominion, and that it should take an active and prompt interest in matters affecting the industry.

President McDougall's Address.

President McDougall said:

"I have to express my great gratification at the compliment paid to Nova Scotia, and my deep appreciation of the honor conferred upon myself by your election of me as President of the Canadian Mining Institute. I shall endeavor to merit the confidence you have reposed in me by attention to the business of the Institute, and all that concerns its welfare and advancement.

"The Canadian Mining Institute, as mentioned by Mr. Hardman, its first President, in the March Bulletin, reached its majority this year, and I think all of us who have attended the sessions of our meeting this week must feel that as an Institute we are alive, virile and capable of greater things.

"Throughout all the meetings, and characterising all the papers that have been presented, there has been plainly observable a desire—nay more—an intention to utilise more completely the resources of Canada, and we must all have noticed further that it is not only the material resources of Canada that have been discussed, but the mental and spiritual forces of our people and our children.

"We welcome to our meeting eminent representatives of the mining industries of the United States, whose vast natural resources of coal and iron have materially aided the defeat of the Central Powers, knowing that behind the great material effort of the United States there was the impelling force of ideals common to the English speaking peoples, the spirit of liberty and rule by the people. We welcome you to Canada, and while we, as technical men, appreciate more than the general public the tremendous help you afforded in material effort, we wish to tell you that what we feel most deeply, and thank you for most, was your endorsation of our ideals, your recognition that our cause was righteous.

"We knew from the first that neutrality in moral questions was not possible, and felt that so soon as the Allied cause was seen by the United States to be a choice between good and evil, you would be with us—and you were.

"You have listened to the recitals of the work of our tunnelling corps—unvarnished records of work accomplished, and behind these records of professional duty, we feel the impulse of the spirit of patriotism and simple duty, that prompted men—members of our own Institute—to deeds of which they tell us very little, but as to which we can judge by the total defeat of our enemies that resulted.

"Yesterday there was unveiled a simple memorial of the war record of our members, which will always occupy the place of honor in whatever situation our Headquarters may be placed.

"You have heard papers touching upon some of the latent resources of Canada concerning the improvement of processes of extraction which may render valuable mineral deposits now considered of little account, and you have heard accounts of exploration in the far recesses of the Dominion. You have heard discussions on matters of education, of the mutuality of interests of the man who earns wages and the man who pays them, references to the new spirit that is abroad and which we must recognise or take the consequences, and all these things are evidence of the force that the Canadian Mining Institute is in our country, of our vitality, our great possibilities, and of the truth of our claim to represent the industry and its ramifications from coast to coast. I believe in the Canadian Mining Institute, am proud to be its President in the year of its majority, and it will be my endeavor to forward its interests to the full extent of my ability."

Mr. Tyrrell Advocates Greater Activity in Public Affairs.

Mr. Tyrrell, when called upon to address the members, said:

"I am here this evening as the representative of a large number of members of the Institute, a minority, it is true, but a minority that was almost a majority in the largest vote ever poled in any of our elections.

"It should be a source of pride to all that though the election was keenly contested, no unfriendly note was heard anywhere. We claim to be the Party of Progress, but after hearing the speech just made by Mr. McDougall, our President-elect, I think that we may consider him as also belonging to the same party, and that we can safely stand behind him in such measures as he may adopt for the welfare of the Institute as a whole, or of its members in particular.

"This Institute is composed chiefly of mining engineers, who are more or less responsible for the conduct and operation of the mines and metallurgical works of the country. In this capacity they are in constructive and administrative charge of great industrial enterprises. In this respect they are on a par with civil and other engineers, who are also in charge of constructive works, but there is this difference between them, that mining engineers find or produce the materials on which they operate, while the other engineers have all materials furnished to them. In fact, the enterprises with which our mining engineers are connected are part of a vast productive industry, which is second only to agriculture as the greatest productive industry in Canada, and the members of this Institute are bound by their duty as citizens to watch over the welfare of the industry with which they are so closely connected.

"No organisation in this Dominion can boast of having abler and more patriotic men than we have. Great numbers of our younger men offered themselves at once when their country called them. They gave their lives freely and quickly for the cause of civilization. We are fortunate in having some of them back with us to-night, and we are glad to say that others will soon be home, but these men who have returned or are returning gave their lives just as truly as those who rest beneath the soil in France or Flanders. They made splendid reputations for themselves, both as soldiers and engineers, so that the whole world recognizes their merit. Also the older men who stayed at home have conducted our mining and metallurgical operations with marked success.

"Our members, therefore, would be a credit to any organization, and individually no honest criticism can be offered against them. But in civil life they have

not co-operated as freely and closely as they should have done in order to obtain the most effective results, for the best results can only be obtained through close co-operation and co-ordination of effort.

"We come together at our annual meetings once every year, and we have pleasant social gatherings. They are delightful holidays, and most of our members deserve holidays after a year of more or less complete isolation at the mines. Besides enjoying ourselves, we read a few papers which are printed in our transactions, and are afterwards read by a dozen or more men who may be interested in the particular branch of the subject there discussed. We also add a little variety to our proceedings by discussing our own by-laws and endeavoring to make some changes in them. Probably interest in the by-laws is promoted by a very general feeling that the Institute ought to be more effective, and in default of any better idea the opinion becomes prevalent that it would be more effective if the rules governing it were altered.

"Although we have an organisation, the members of which are in executive control of the next to the largest producing industry of the country, the people constituting the outside public take very little interest in us, as we can see by glancing at the daily papers of this city. These papers are conducted by able, intelligent men, who see that anything good that the people will read is printed in them, and evidently the people will not care to read of our doings. Now the people elect the Members of Parliament and of the Government who govern the country, so that the Government, which is a thoroughly democratic one controlled by its electors, also takes very little interest in us. Farmers, fishermen, lumbermen, in fact men engaged in almost every other industry in the country are treated with more consideration by the Government than are the representatives of the mining industry. This should not be, and it need not be if we will co-operate and organise our forces better than we have been doing.

"It is right that we should meet here and have a pleasant time, and that we should be able to converse with each other for mutual instruction, but it is not right that we should go away from here and for twelve months lose sight of the fact that we are the rightful guardians of one of the great basic industries of the country, and that it is our duty to take on some of the responsibilities of such guardians.

"You may ask what we can do. Well, we can influence public opinion so that it will demand that in the mines as well as in other industries a man shall give honest work for a day's pay, that he shall be fairly paid for honest work, and that if anyone wishes to invest his savings in mining properties, or industries connected with mining, he will be guaranteed a fair and honest chance of reasonable returns for his investment.

"If the Government is considering the alteration of our mining laws, a committee of this Institute should be consulted, as we are the men who are most interested in the administration of mining laws, and in the results of their enforcement.

"In regard to taxes, we all know that the Government must have a revenue, and that the mines and associated industries must contribute their share of that revenue. Mining men are not slackers, they do not wish to avoid their proper proportion of the public burdens; but they should be consulted as to how a revenue can best be raised with least injury to the industry. We all know that a tax raised in one way may have a very depressing effect on an industry, while the same tax raised in another way may have but little influence on it. The members of this Institute are the men who have technical knowledge qualifying them to decide such questions and in the interest of the industry and of the country they should be consulted. As citizens of Canada they should insist that they be consulted.

"In case of disputes between miners and their employers, the rational place to look for an intelligent Board of Conciliation is among the members of this Institute, who are thoroughly familiar with mining conditions. Where is there anywhere else in Canada a group of men so capable of deciding on the merits of disputed questions in regard to the mining industry as in this Institute. Its members are the natural guardians of the welfare of everything connected with mining in Canada, and if they work together for the common good they will soon have the people and the Government in sympathy with them, and they will see development and progress on every side beyond what they ever hoped for in their most optimistic moments."

Brigadier General Dodds made many friends when he recounted the deeds of several well-known members of the Institute at the front. Needless to say, howver, no name was mentioned that stands higher in the affections of the Institute than that of the late Capt. O. E. Leroy.

Members were delighted to welcome again Professor Jas. F. Kemp of Columbia University, and to learn that his health is improving. Like Bradley Stoughton, Professor Kemp is looked upon as a "regular member" rather than as a visitor.

We missed Dr. A. C. Lane. Perhaps he had not completed his study of that problem "the value of an investment with varying yield," concerning which he was to address the meeting. Dr. Lane does not often miss a meeting of the Canadian Mining Institute.

Dr. Winchell, president of the American Institute of Mining and Metallurgical Engineers spoke a good word for mining in Canada. He has had much experience here, and he says that he always got fair treatment from the authorities.

According to prospectors who have worked in the Belcher Islands there is more good iron ore there than Dr. Moore's report would indicate. It is also claimed that the climatic conditions are not so unfavorable as Dr. Moore found them.

A rather novel method of transporting the powdered coal is in use at Copper Cliff. The coal is crushed at the reverberatory furnace plant, and forced by air to the blast furnace through a three-inch pipe.

The smelter men have of late years been making so many advances in reverberatory furnace practice that the blast furnace has become of much less importance in copper metallurgy than in the earlier years. The experiments now being carried on may result in such an advance in blast furnace work that the reverberatory will take second place again.

Confidence in the Future

The guest of honor at the banquet was His Excellency the Governor General. He was welcomed on behalf of the Institute, and was given an enthusiastic reception.

At the outset he congratulated the members of the Institute on the work they had accomplished during the three day business sessions. Although he craved their indulgence as being a mere onlooker, and not an expert, he thought there were several matters of interest on which one who was not an expert could treat.

"It is difficult to say which one of any particular industry was the dominating factor in winning the war," said His Excellency, "but unquestionably and undoubtedly primary consideration should be given to the character and determination of the people who were waging that war on our side. It is to the determination and strong character of our people, and the people of our Allies, that we must look for the determining factor in the result of the war. But even this character and this determination of the people would have been of little avail if we had not had wonderful natural resources behind us, and it is very largely due to the fact that the Allies were able, through their experience, their knowledge and their skill to turn these great resources into devices of war that we ultimately won."

Speaking of the great accomplishments during the war, he commented on the great results that will follow when all this enterprise, skill and power is turned to the task of construction.

"This is a work you, as engineers, are dealing with. This is a work which lies in front of you. We have witnessed during this period of war the most wanton and hideous waste imaginable. What we have to do now is to build up, and the only way in which we can build up is to do everything we can by wise economy and increased production. These are the problems which come before you, not as mere theorists, but as men engaged from hour to hour, from day to day, in the practical work of investigating natural phenomena, and working out their problems.

"Obviously, it is not for me, in my position, to attempt to lay down either rules of policy or rules of conduct. But certainly I may say that my experience here—very short, but if I may be allowed to say so, my very happy experience in Canada—teaches me that far greater attention ough to be paid than is paid at the present moment to research work and to the development of the natural resources of the country. And I cannot help thinking that, in facing the great problems which lie in front of us, those who are responsible for the administration and the conduct of affairs should proceed on these lines.

"Whatever money is required to be spent, that money should only be considered as an investment, and a very safe investment.

"There is one other matter to which I wish to refer to-night. Throughout the world to-day we are witnessing great upheavals. Many new theories are floating backward and forward, but it is for us now, without embarking on untrodden paths, to thoroughly recognize and realize, whether we are working with capital or working with labor, that their powers—the powers of capital and labor—lie together. We have only one object in view, and it is by cooperation, by unity and identity of purpose, by harmony, that we shall be able to achieve the best results. After all, gentlemen, that was what guided us in the war. We won the war, and we won it because all people threw their heart and soul into it. Each and everybody did his and her best, and we may all rest assured that, great as were the triumphs which were won on the field of battle, still greater triumphs can be won in the arts of peace.

"I have said on more than one occasion—and I do not hesitate to say it again—that I am an optimist. I have implicit faith in the inherent, sound commonsense of the citizens of the British Empire. We may do odd things sometimes; we may do the right thing in a very odd manner, but—I will not say invariably, because that would be egotistical—but I do say that we generally arrive at the right result.

"We have now reached the period in our history when it is time for stock-taking. We are possibly—I do not think we are, but we may be at the parting of the ways; we may be going to break into factions on one side or another. We may be going to wrangle about things which may eventually assume proportions which may very soon bring us to grief.

"I say we 'may be,' but I do not believe we 'are' going to take that course. We are going to take a higher course. We have the record of the war behind us. We know we possess great natural resources. We know we have a people of character and ability. If the fullest use is made of these resources and opportunities—and I believe the present is a great opportunity—we can look forward with great confidence to the future. You, gentleman, both in your individual and in your corporate capacity as a great institute, are closely identified and connected with many of the greatest industries of the country. You are able to take a leading and prominent part in the material development of the country's resources, and in guiding the policy and destiny of the Dominion. The responsibility is by no means a light one. But in your hands I know that it is safe."

For the first time, the members of the Mining Society of the Mining Society of Nova Scotia were present as members of the Canadian Mining Institute.

The meeting room was not a satisfactory one. The chairs were noisy, the heating poor and the lighting arrangement rotten. The program was so good that the members put up with many inconveniences with little complaint. But little credit for the success of the meeting can properly be given to the hotel management.

The serving of refreshments at the evening meeting on Thursday was much appreciated. The supply was apparently inexhaustible.

The old tunnels built centuries ago near Arras were used to good advantage by our soldiers. Apparently it was the practice of the builders of those days to excavate and build at the same time. The material for the buildings and walls came from the tunnels which were to form underground exits in time of danger. One much used tunnel was that, seven miles in length, which connected a monastry and a convent.

NOTES ON THE MINING INSTITUTE ANNUAL MEETING.

The record of progress in mining in Canada can in some measure be guaged by the nature of the annual meetings of the Canadian Mining Institute. At the meeting held this year there was abundant evidence that good progress is being made in many departments of the industry.

Production in 1918.

The reports on production presented by Mr. McLeish of the Mines Department, Ottawa, by Mr. T. W. Gibson, Deputy Minister of Mines, Ontario, and Mr. Theo Denis, Superintendent of Mines of Quebec, not only showed that the output of necessary minerals was well sustained in spite of the many difficulties, but also indicated that much has been accomplished in developing deposits that were idle when the war began.

The report of Dr. R. C. Wallace on developments in Northern Manitoba, showed that that province is to be counted on in the future as an important producer of minerals. The speed with which the deposits will be developed will evidently depend largely on what is done with the great deposits at Flinfon. If arrangements are made to build a railroad to Flinfon and erect a smelter there, the province of Manitoba will step at once into prominence. In any event, we may look for development of other properties in a smaller way.

Northern Exploration.

The excellent accounts of Mr. K. G. Chipman and Mr. J. J. O'Neill of explorations in the far north show that there are not lacking men who will endure any hardship necessary to determine what our resources are. They found no rich deposits, but they brought back information that will be of great value to future explorers.

M. E. S. Moore's account of the Belcher Island iron ore deposits was listened to with much interest. Mr. Moore is not enthusiastic over the possibilities of these deposits, but he placed on record a description of the iron formations in a part of Canada that was before the Flaherty expeditions practically unknown.

Such accounts of exploration as these of Chipman, O'Neill and Moore are indications that the Canadian Mining Institute is taking a proper interest in the development of the far north.

Gold Dust Firing of Blast Furnaces.

Of unusual interest to smelter men was the paper presented by L. H. Wotherspoon. Mr. Wotherspoon, who is consulting engineer for the International Nickel Company, gave in some detail an account of the experiments which have been carried on at Copper Cliff, Ontario. During the war there was naturally little opportunity to experiment at Copper Cliff. The furnaces were kept busy turning out the much needed nickel matter. Nevertheless, marked success was attained during the war, and now that the pressure is off we may expect that every opportunity will be given to the experimenters at Copper Cliff. We can only hope that progress will continue as successfully as the experiments indicate it will.

Mr. John Hardman's reminiscences of the early days of the Institute make good reading. The first president has always devoted much time and attention to the affairs of the Institute.

We hav'n't yet been advised by Lt.-pCol John J. Penhale, but we have no doubt that there was a branch meeting of the Canadian Mining Institute in France on March 5th to 7th.

A Hastings district branch of the Canadian Mining Institute has been organized. Mr. S. B. Upright is chairman, Geo. S. Gillespie vice-chairman and R. A. Elliott secretary.

Mr. Rickard was not present, but his paper on "The English Speaking Peoples" has been published in the Institute Bulletin, and will be read with interest by those who did not have the pleasure of listening to Mr. Rickard at the New York Meeting.

As a result of the careful work done by the tunneling companies at the front, we may expect to have important advances in the science of tunneling. There will also be available much useful and accurate information on theory and practice of explosives.

Mr. Gibson's paper on "Principles of Mining Taxation" is an important contribution. The Deputy Minister of Mines of Ontario pointed out the advantages of the profits basis for taxation. Those who have to pay taxes on mines which yield no profit will appreciate Mr. Gibson's remarks.

The discussion of "mining laws" is naturally of much interest to members of the Mining Institute for the law determines to a large extetn the activities of men. At present there is more than the ordinary interest because of propsed changes. The papers presented at the Mining Institute meeting are not yet available, but they will attract attention when printed.

The royalty clause of the mining regulations of the Department of the Interior needs revision. It is too indefinite. There is said to be no intention to charge excessive royalties but there is no guarantee that such will be the case after the miner has spent his money in exploration and development. Some limit should be fixed.

Mr. Brightstocke in his paper on co-operation among small mines touched on a matter of great importance. Too often the experience gained on ore property is not readily available for the neighbors. If owners of neighboring small mines shared the expense of securing the best technical advice there would be more progress at less cost.

Mr. Corless has to his credit many valuable contributions to the Institute. The paper on "Industry, Democracy and Education", presented at the Montreal and New York meetings is one of exceptional merit. Mr. Corless presents a strong case for industrial co-operation and education. He is an earnest thinker, and he has the advantage of being in close touch with his subject. He believes in recognizing the existence of unsatisfactory conditions and in applying his best efforts to improve conditions.

The Outlook for Mining in Northern Ontario

During the year 1918 mining was carried on as vigorously as possible in the metal mining districts of Ontario and in spite of shortage of labor and high cost of supplies a new record for production was made. The increase in value was however to a considerable extent to higher selling prices, the quantity produced being necessarily restricted.

Before the year had ended a great change took place in some branches of the industry. After the armistice was signed the demand for certain war materials faded away and the demand for common metals that have recently been used chiefly for war purposes also fell sharply.

In consequence there has been some decline in output in Ontario's greatest mining district, the Sudbury nickel-copper mines being no longer worked to capacity.

On the other hand, there has been a distinct revival of interest in gold mining. The conditions which had grown almost unbearable for gold mining companies have given place to much more favorable ones. Already there has been much improvement and the outlook is promising for far greater activity in the gold areas than has yet been witnessed. The leading gold mines struggled hard but successfully through a trying period and will immediately benefit by the changed conditions. Increase in the working forces is being made and plans for increasing production are well under way.

During the latter part of the war it was found necessary to close down some of the gold mines which could be operated profitably in normal times but not under the war conditions. These are now being reopened.

Other gold mines that have received little attention during the war will be active this year and there can be little doubt that before the year is out there will be a number of new producers on the list.

The improved prospect for gold mining has led to a revival of interest in gold properties everywhere and there is abundant evidence that there will be much exploration in northern Ontario gold areas.

The strong position of silver is greatly assisting the Cobalt silver mining companies. The decreased production of other countries is making the silver deposits of Cobalt more profitable than was expected. If the price stays near the present figure for any length of time it will be possible to market profitably a large amount of silver that would at the old prices have necessarily been left in the ground. It seems probable that there will be great activity in the Cobalt area this year to take advantage of the favorable conditions to get out low grade ore. The high price is also giving a great impetus to prospecting work which should result in further discoveries.

While the smaller demand for nickel and copper has resulted in some curtailment of output, the coming summer will be an active one at the nickel mines.

At the mine and smelter of the British America nickel company work has progressed rapidly during the winter. The Mond and International Nickel companies will have much work to do that could not be undertaken without interference with production. There may be a temporary slump in the market for nickel and copper; but the world needs these metals and the big companies will make use of the breathing spell to prepare for busy days ahead.

During the war the demand for building materials has been comparatively low. Now that a period of construction has been entered upon we may expect greater production of many non-metallic products.

Altogether the outlook for the mining industry of Ontario is very favorable. Changes are taking place rapidly and it is difficult to see far into the future, but so far as can be seen there is great activity ahead.

In Quebec during 1918 there was a large production of asbestos, pyrites, magnesite, chromite and molybdenite for war purposes. In spite of the lack of demand for structural materials the province made a new high record for mineral production. Naturally the cessation of hostilities has resulted in a great change in conditions and some of the minerals that were much in demand a few months ago are not wanted in large quantity now. On the other hand the demand for structural materials is sure to be large and will help to offset the falling off of demand for "war materials."

In the case of asbestos there is good reason to believe that the demand will continue. As Quebec is the world's chief source for asbestos and as many new uses are being found for this material, Quebec's chief mining industry is in a safe position.

Chromite mining is not expected to be very active in Quebec in the near future. Chromium is necessary for the manufacture of nickel-chrome steel and must be obtained in some quantity at all times; but it is unlikely that high prices will be obtained for for some time at least.

During the war there was developed in Quebec a great molybdenite mines. This mineral is not now in great demand, however. Nevertheless, there has been a gretaer appreciation of the value of molybdenum steel and it is probable that much more will be used in the future than was the case before the war.

PERSONALS.

Mr. Charles Camsell, head of the Geological Survey Branch in British Columbia, is in Ottawa arranging with the Geological Branch of the Dominion Mines Department, for the field work to be carried out in British Columbia during the coming season. It is understood that British Columbia is likely to be treated fairly well in this respect during 1919, thus permitting progress to be made on work which has been somewhat interfered with by the war, which took away many of the prominent young members of the Canadian Geological Survey Department. While East Mr. Camsell attended the convention of the Canadian Mining Institute. He expects to return to this Province in April.

J. K. Batchelder, superintendent of refineries for the Consolidated Mining & Smelting Company at Trail, B.C., died recently of influenza, followed by pneumonia. He was born at Wilton, N.H., on March 27, 1890, and graduated from the Massachusetts Institute of Technology, Boston, in June, 1913, in electro-chemistry. He came to Trail in August, 1913, and was in the smelter assay office from 1913 to 1915, in the zinc plant from 1915 to 1918, and made superintendent of refineries in February, 1917.

NORTHERN ONTARIO.

Companies Planning to Develop Skead Township Properties.

Five chartered mining companies are planning to do work this summer in the Skead township mining area, namely: Skead Gold Mines, Wisconsin-Skead Mines, Crawford-Skead Gold Mines, Fidelity Gold Mining Company, and the St. Paul & Minneapolis Gold Mines. The Crawford-Skead Gold Mines Company was recently organized for the purpose of operating the two claims owned by Harry Crawford, and plans have been outlined for doing considerable work this year. The Skead Gold Mines company also expects to do considerable work this summer, and is taking in material over the winter road with this end in view. Considerable surface work has been done on the properties of the other companies mentioned, and results to date have proven highly encouraging. Other property owners in the district are anticipating the performance of much assessment work in the next few months.

Ontario-Kirkland Sinking Shaft.

Although considerable delay was caused by lack of power in the early part of the current year at the Ontario-Kirkland property, the sinking of the shaft is now proceeding at a rapid rate and has already reached a depth of 150 feet. About four feet of sinking per day is being accomplished with the new electrically driven plant, which was installed during the latter part of the past year. The present plans call for the sinking of the shaft to a depth of 300-feet, where lateral work will be proceeded with. A number of veins occurring on the surface will be crosscut, and the most promising will be drifted upon. The vein on which the present shaft is being sunk is said to be still in the working at the depth of 150 feet. It is highly mineralized and the gold values obtaining are understood to be highly encouraging.

Burnside Mill in Operation.

The new mill at the Burnside property at Kirkland Lake was put in operation last week for the first time. This will add yet another small producer to the list of gold mines of the North Country, results of the first try-out of the mill having proven satisfactory. The new plant at the Burnside has a capacity of about thirty tons per day, and provision has been made in its construction for enlargement as soon as mining operations demand increased milling facilities. In the meantime the consolidation of the Tough-Oakes, Burnside and the Sylvanite continues to look promising. Such a merger would make available the 140-ton mill of the Tough-Oakes for the treatment of ore from all these properties, which are favorably situated to be economically worked under the one management.

Kirkland Lake Proprietary.

According to a circular letter recently issued by the Kirkland Lake Proprietary Gold Mines, a scheme of amalgamation and absorption of the properties and assets of the Tough-Oakes Mines, Ltd., the Burnsides Gold Mines, Ltd., the Sylvanite Gold Mines, and an important Cobalt company has been provisionally agreed to by the first mentioned company, being subject to the confirmation of their respective valuations by Mr. H. H. Johnson, consulting engineer for the Kirkland Lake Proprietary, and will be submitted for approval to the shareholders of the various companies after his report has been received. Mr. Johnson was expected to arrive in Canada last month and it was thought his report would be ready during the current month. The amalgamation should prove advantageous to all parties concerned as well as to the Kirkland Lake Proprietary, which holds a controlling interest in most of them as well as a considerable area of other claims. When the amalgamation is completed the absorbing company will own a continuous and compact block of claims aggregating over 600 acres in extent, situated in the centre of the Kirkland Lake gold field, and it is believed the results already obtained at several points on the various properties warrant the erection of a large central installation, which will insure quicker and more effective development with much lower working costs than have hitherto been possible. Active operations are now in progress on the Cobalt property and good developments are reported." This proposed amalgamation is looked upon with much favor by those interested in the North Country.

Lake Shore.

Official figures of production for the month of January at the Lake Shore Mines, Kirkland Lake, show gold bullion to the value of $45,162.42 thus establishing a new high record. The mill on the property was started on March 8, 1918, and much surprise was expressed when the first month's clean-up proved the ore treated to have averaged $23.43 per ton, which was the highest average of any gold producing mine in the Dominion. However, from month to month the grade of ore and quantity treated has shown a tendency to steadily increase, with the month just past breaking the record in both respects for year with the treatment of 1,725 tons of ore showing an average gold content of $26.12 per ton. The February figures of production will not be available until about the middle of the current month, but owing to the uniformity of production during the remainder of the year it is safe to estimate production for February at $45,000, while the output of the first week in March, which is necessary to complete the full year's operation of the milling plant may be safely given as $10,500, it will be seen that the grand total for the first year's operation of the property has resulted in a recovery of $515,892.17.

The official report for the month of aJnuary is as follows: 200-ft. level. The drift on the No. 2 vein east was advanced from 261 to 280 feet.

400-ft. level.—On No. 1 vein west the crosscut south was advanced from 20 to 49 feet. No. 1 vein west, was advanced, north branch, from 399 to 491 feet. No. 2 vein east, north branch, was advanced from 420 to 453 feet, while the south branch was driven ahead from 425 to 452 feet. No. 2 vein West was advanced from 192 to 214 feet.

The mill ran 90 p.c. of the possible running time, reducing 1,725 tons of ore and recovering therefrom $45,162.42."

McKinley-Darragh-Savage.

The new pumping equipment at the McKinley-Darragh-Savage Mines, Cobalt, is in readiness for the commencement of pumping the sands from the bed of Cobalt lake to the oil flotation plant completed last year. Formerly a bucket line excavator was used for this purpose, but the newly installed apparatus is much more efficient and will permit a capacity of 350 tons per day, thus adding to the production of this portion

of the plant. Underground work at the property is serving to produce sufficient profit to meet the dividend requirements of the company, which for a number of years have been maintained at a rate of 12 per cent. per annum, being paid in quarterly instalments of three per cent. The company has declared a regular dividend of three per cent, payable April 1st to shareholders of record March 8th. The annual meeting of the company was held March 8th.

Allied Gold Mines.

The second diamond drill hole on the property of the Allied Gold Mines, formerly known as the O'Donald property at Boston Creek, on the boundary line of the townships of Pacaud and Boston, has been started and will be driven to a depth of 600-feet. This second hole is being driven on the portion of the property lying adjacent to the property of the R. A. P. Syndicate, while the first core obtained was taken from the claim lying in the township of Pacaud and adjacent to the Patricia mine. Encouraging values were encountered in the first hole driven and further enlarged development is looked for on the property in the near future.

On the Cullen-Renaud claims, which also belongs to this company, it has been decided to continue the sinking of the shaft to a depth of 150-feet. This working has already passed the 50-foot depth, at which point results obtaining were highly satisfactory. This work will be accomplished by the aid of a steam plant, which will be replaced during the coming summer by electrically driven equipment for the more extensive development of the property.

McIntyre-Porcupine.

The big way in which the McIntyre-Porcupine Mines has been developed at the 1,000-foot level, coupled with the fact that plenty of efficient labor for construction purposes promises to be available in the near future, has given rise to reports that the milling facilities of the mine will be increased from the present capacity of 600-tons per day to 1,000-tons. This plan was under consideration at the time the war broke out and has been held in abeyance since. The orebody which provided so extensively at the 1,000-foot level has been proven to hold its width and values at a depth of 1,350-feet, and it is confidently expected will continue to much greater depth, indicating justifiable reason for great expansion at the property. Close to half a million tons of ore, which has a value of around $10 per ton has already been placed in reserve. With close to five million dollars in ore available and a large cash surplus, the mine and finances of the company are in a strong position, and reports of an early dividend disbursement appear to be well founded.

Alexo.

During the last week in February the Alexo Mine at Porquis Junction shipped three cars of nickel ore containing approximately 280,000 pounds. This compares with 400,000 pound during the preceding week and brings the total up to 1,360,000 shipped during the month.

Cobalt Silver Ore Shipments.

An aggregate of 25 car loads of ore were shipped from the Cobalt camp during the month of February, containing approximately 2,011,367 pounds of ore. This compares with 25 cars containing 1,915,128 pounds in January and is also considerably higher than the December shipments.

HOLLINGER.

According to information just at hand the Hollinger Consolidated may spend upwards of $500,000 or perhaps as much as $750,000 this year on additions to its plant and equipment. Already a total of $3,230,943 has been spent on plant and development account since 1910, and the plant has a capacity of about 2,800 tons daily. By the way the labor situation is adjusting itself in favor of the gold mines, the Hollinger is expected to be operating at full capacity within a very short time. Pointing toward this is the fact, as stated a week ago in these columns, that another forty stamps were being pressed into service.

This has led to an analysis of the situation of the Hollinger mine and company on a basis of operating at full capacity. Although in 1918 the ore treated averaged close to $10 to the ton, and the reserve of $41,000,000 were made up of ore averaging $9.15 per ton, yet in the following analysis it has been deemed best to conservatively estimate the recovery at $9 per ton.

Reserve tonnage	4,489,080
Gold content per ton	$9.15
Total value	$41,080,005
Cost per ton	$4.50
Profit in sight	$20,540,000.02
Plus surplus	$2,071,287.01

It will be noted that costs have been estimated at $4.50 per ton, whereas during 1918 they averaged $4.94 per ton. The reduction is due to the expected big decline in costs which might reasonably decline to perhaps $4 per ton or less. Therefore, the above figures which show a visible probably profits of $20,540,000.00, and a surplus of $2,071,287.01 or a total of $22,611,000.00, are the result of an exceedingly conservative analysis. They do not take into account the fact that there are an additional forty veins on the Hollinger, opened up veins might comprise a small mine in itself, or perhaps an aggregate of forty small mines added to the already enormous resources of what is so far proven on the Hollinger.

As for the output to be expected from the Hollinger, on a basis of its present milling capacity, the following is a concise summary of what may be expected.

Daily capacity	2,800 tons
Daily output	$25,200.00
Monthly output	$756,000.00
Annual output	$9,000,000.00
Daily cost	$12,600.00
Annual cost	$4,500,000.00
Annual profit	$4,500,000.00
Percentage on capital	18 per cent.

The Hollinger planned increasing its capacity to 3,800 tons daily, but the plan was deferred owing to the war. It is now considered probable this plan will be soon carried out. The following is an analysis of what might be expected, following such an enlargement to the mill:

Daily capacity	3,800 tons
Daily output	$34,200.00
Monthly output	$1,026,000.00
Annual output	$12,312,000.00
Daily cost	$17,100.00
Annual cost	$6,156,000.00
Annual profit	$6,156,000.00
Percentage on capital	25 per cent.

Such conveys a concise summary of the present situation, and the future possibilities with regard to the Hollinger.

Special Correspondence

BRITISH COLUMBIA.

Would Remove Duties on Mining Machinery.

Several resolutions of importance to the mining industry of British Columbia, in the event of their recommendations being translated into fact, were passed at the annual convention of the Associated Boards of Trade of Eastern British Columbia, which took place recently at Revelstoke, B.C.

One of these proposes that the duty shall be removed from machinery which is not manufactured in Canada. This, it is pointed out, would materially assist mining operators who are hard put to it to finance the development and the placing on a shipping basis of their properties and who, at the best, must conserve their resources to the utmost. It would mean substantial reductions on the cost of installation in British Columbia on concentrating mills and all manner of mining equipment which now comes from the United States exclusively. This resolution will be presented to the Dominion Government as expressing the sentiment of the mining communities and district of the eastern sections of the Province, and it will be pointed out that acquiescence in their wishes would not have the effect of injuring in any way the manufacturing interests of Canada.

Another suggestion which the Convention is sending forward to the Federal Administration at Ottawa has to do with the erecting and operation at different points in the province of plants for the testing and concentration of mineral ores with a view to ascertain improved methods of treating the complex ores of the Kootenay Districts and also to the end that the prospectors and operators may receive advice, without inconvenient loss of time, as to the proper equipment for the treatment of the ores of any special property in which they may be interested. Mr. F. A. Starkey, former President of the Associated Boards of Trade, in the course of a report of the year's mining and general industrial activity, told of the appointment of a committee of members of the organization to investigate the equity or otherwise of the schedule of rates charged by the Consolidated Mining & Smelting Co. of Canada at its Trail Smeltery for the treatment of custom ores. He expressed absolute confidence in the ability of the members of the Committee and of their intention to make the probe thorough and searching. It was necessary, however, that all who had complaints to make should do so without hesitation as, only by such co-operation, could those charged with the work of investigation satisfactorily discharge their duties.

Workmen's Compensation.

The coal miners of the Crowsnest Pass District, through the medium of Gladstone Local Union, No. 2314 U.M.W. of A., are petitioning for amendments to the Workmen's Compensation Act of British Columbia. They declare for a variety of reasons that changes should be made providing for the board being represented in the Crowsnest District by permanent representatives; for an increase of 100 per cent in the compensation allowed for dependents; for a clause permitting workmen to take proceedings at common law in case of serious injuries, and where it is suspected that the accident was caused by negligence; and for an amendment that will allow appeals from the decision of the Workmen's Compensation Board to the Court of Appeal.

Tudhope Electric Metals, Ltd.

A small electric furnace, designed primarily for the reduction of scrap metal, is to be installed on False Creek, Vancouver, by the Tudhope Electric Metals, Ltd. Construction has commenced and the plant is expected to be ready for operation in the course of a few months. It is likely that it will be used for the purpose of giving a practical test to the much discussed question of the feasibility of electrically treating the megnetite ores of British Columbia.

No Change in Wages at Trail.

Mr. S. G. Blaylock, Assistant General Manager of the Consolidated Mining & Smelting Company, in a recent statement asserts that there has been no change in the scale of pay at the Trail Smeltery since June 1, 1918. He explains carefully that any difference that may be found by the men in the bulk of their pay envelopes is due entirely to the recent decline in the price of metals. He then enumerates the various bonuses and their character allowed since the month of June last year.

Government Engineers Will Attend Convention.

All the mining engineers of the Government of British Columbia will attend the International Mining Convention to be held at Vancouver next month. They have been called in from their various districts for that purpose and probably each will submit a paper dealing with conditions and the future of the mining industry in the particular area over which he has supervision.

Cork Province Mine.

Arrangements are said to have been perfected for a loan of $20,000 from heavy stockholders of the Cork Province Mine, thus assuring retirement of endebtedness of $12,000, which will carry the company until shipping becomes possible in May or June. The loan is in the form of one-year first mortgage notes, bearing 8 per cent. with stock conversion privilege for half the amount. The property is situated on the south fork of Kaslo Creek, 12 miles from Kaslo, in the Ainsworth District of British Columbia. It is equipped with milling plant and flotation, hydro-electric power, sawmill, electric light system and all necessary buildings. A statement issued by the company after operations were temporarily discontinued a few months ago shows that a net profit of $12,000 monthly may be expected when operations are resumed, probably early in the month of April.

Britannia Mines, Ltd.

The Britannia Mines, Ltd., operating on Howe Sound, British Columbia, and one of the big producing mines of the province, has recently discharged many of its employees. Economic conditions rendered the reduction of the strength of the staff essential; but the company, in following the dictates of necessity, has been careful to eliminate those of its men who were of enemy alien origin. It is stated that it has dismissed 450 of this class in the course of the last few weeks, leaving about six hundred at the mines. All these are of British or Allied birth. Under an Order-in-Council recently passed by the Dominion Government, enemy aliens who are considered undesirable can be summoned before a judge named for the purpose, who may determine whether such persons should be interned as prisoners of war.

Operators Oppose Some Proposed Amendments to B. C. Act.

Representatives of the Coal Mine Operators of British Columbia waited upon the Executive Council of the Provincial Government on the 27th of February to register some objections to the amendments proposed by Hon. Wm. Sloan, Minister of Mines, at the present session of the legislature to the Coal Mines Regulation Act.

As is indicated by the summary of these amendments, which already has been published, the first change contemplated is the inauguration of a Minimum Wage Board which shall have power to fix districts in which such minimum wages as may be decided upon shall be made to apply. It is not stated, however, that the same wage shall be enforced for each district or that a minimum shall be applied to all the coal mining sections of the Province.

Such legislation, the operators assert, discriminates against the coal mining industry. They say it also discriminates against collieries, as a minimum may be applied to one and not to the other. It is "vicious," it is declared, for these reasons and because it places too much power in the hands of the Minister of Mines. Further they maintain that the establishment of a minimum wage will have a tendency to do away with contract work, under which system the coal mines of British Columbia are operated. They would have the effect of reducing production. It will, in their opinion, increase the cost of production and, the greater the cost of local coal, the larger proportion will be imported and consequently the greater the loss of revenue to the Province. The dealers, it is affirmed, were driven out of the coal market of California because of the production costs and, if it was to continue, would meet with a similar fate with regard to all the foreign markets.

Competition, it was declared, was becoming closer in the State of Washington and, when it was remembered that of the 2,000,000 tons produced in 1917 no less than 800,000 tons was exported, the seriousness of such a loss would be better appreciated. Moreover, any greater increase in production costs, which would mean beyond question a further advance in retail prices, would result in the encouragement of the replacement of coal by fuel oil. This transition was a factor which these interested in the coal trade had to face. If it persisted it simply meant that more and more capital which now was invested locally in locally produced fuel would be expended on an imported fuel and would fatten foreign profits.

Exception was taken to the proposal that the Lieutenant-Governor-in-Council should be given power by the Legislature to make such orders as may be deemed necessary from time to time for the further safeguarding of the lives of underground workers. The criticism offered was that it would result in uncertain conditions. Operators might be confronted from time to time with new regulations having the effect of disturbing their settled and smoothly working systems of management. They wished to make it clear, however, that they were anxious to co-operate at all times in all reasonable measures calculated to promote the safety of the miners. Their point was that the Provincial Executive was taking too much power to itself at the expense of the Provincial Legislature.

The delegation took advantage of the opportunity to protest, as well, against the enforcement of the provisions of the Eight Hour Act, which was passed by the Legislature in 1918, and which gives all those working above the surface around coal mines the same working day as those employed under-ground, namely, the Eight Hour Day. This law becomes effective on the 31st of next March and it was stated that, as it would tend to increase production costs, the wisdom of permitting it to remain without change should be made the subject of inquiry by commission.

There have been reports that the Provincial Government proposes increasing the tax on coal produced in British Columbia from 10 cents to 25 cents a ton. While the statement has been publicly made that such action is under consideration no pronouncement has been made from official circles. It is thought that this accounts for the fact that the operators took occasion, when meeting the Government, to submit a petition for the reduction of the present 10 cent a ton tax to 5 cents a ton. One of the arguments advanced in this connection was that in Alberta the tax is only 5 cents a ton and that British Columbia coal already comes into competition, to some extent, with that of the sister province. It also was asserted that the points already enumerated against any action being taken that would have the effect of increasing costs, which under present conditions were extremely high, applied to the question of taxation. It was essential that the burdens of the operators should not be made greater if the coal mining industry was to be maintained in a prosperous state.

The personnel of the Operators' Delegation was as follows: J. M. Savage, general manager of the Canadian Collieries (D), Ltd.; Thomas Graham, general superintendent of the Canadian Collieries (D), Ltd.; J. H. Payne, managing director of the Pacific Coast Coal Mines, Ltd.; R. M. Young, secretary of the Crow's Nest Pass Coal Co., Ltd.; R. S. Ord, manager of the Corbin Coal & Coke Co.; J. J. Grant, managing director of the Nanoose Collieries; H. Gallagher, secretary-treasurer of the B. C. Coal Mining Co.; E. N. Yarwood, representing the Canadian Western Fuel Co.; T. McNeil, secretary of the Western Coal Operators' Assn., and Mr. H. B. Robertson counsel for the Canadian Collieries (D), Ltd.

Kootenay Gold Exploration Co.

Nelson, B.C. — The Kootenay Gold Exploration Company, which operated the Granite-Poorman Mine is expected to resume operations shortly. Action has been taken towards the paying off of local creditors, and it is expected that the company named, which bonded the property from the old Kootenay Gold Company, will commence work without delay. J. J. Malone, of Nelson, is the liquidator for the latter concern.

Free Miners' League.

Prince Rupert, B.C.—The Free Miners' League of Central British Columbia, which proposes working for the advancement of the mining industry in the northern and central districts of the Province, was organized recently at Prince Rupert. Officers have been elected as follows: President, A. C. Garde; Directors, Messrs. P. R. Backus, J. C. McLennan, George Kerr, George Frizzell, J. Lorne MacLaren, and W. E. Fisher. Mr. W. C. Wilcox has been appointed secretary.

Lower Prices Necessitate Lower Wages.

Tacoma, Wn. — A number of British Columbia shipping mines, as well as other similar properties more immediately tributary to the Tacoma Smelter, have been seriously affected by the recent material reduction in payments on ore. Production in most cases has been reduced from forty to fifty per cent, and it is becoming in most instances a case of continuing operation merely for the sake of maintaining an organization that will be ready when market conditions improve. The Tacoma Smeltery is operating only one furnace, whereas it had three in blast a year ago. A reduction in the wages of employees amounting to 12½ per cent of what has been paid took effect on the 1st of March, the minimum wage for common labor being now $3.75 a day.

Anyox, B.C.—An interesting statement was made recently by the management of the Granby Consolidated Mining & Smelting Co.'s plant at Anyox, B.C., relative to the present condition of the copper market and the consequent necessity of reducing wages. It was announced that from the 1st of March the men's pay would be based on the sliding scale, which scale will be regulated by the price of copper. Certain other concessions are granted, however, which will serve to assure the workmen a good living return over the period of temporary depression, and which, in general, guarantees them just and equitable treatment.

It is pointed out that the copper market has practically collapsed, there not being a ten per cent purchase demand as compared with normal production. Copper produced at Anyox plant since October 1st is still unsold, and there is every likelihood that it will have to be disposed of at the present low market price, or less. Anyox copper in transit or on hand up to the middle of February was 16,448,000 pounds.

The company describes the subject of maintaining operations as a serious one, as each month's production, added to the amount already named, increases an already considerable burden, making the question of continuance a grave one.

In all similar periods of depression, it is explained, the policy of the company has been to keep up production, and for many years prior to 1917 the sliding wage scale, based upon the price of copper, was in operation, a method of dividing extra profits with the men who help to produce, without their having to assume any of the responsibilities of operation or the risks of loss. This was regarded as fair by both parties.

In order to assimilate the extra cost of living at the company's property, and until such time as wholesale prices are reduced, the company will pay a bonus of 50 cents a day to each man. As a further measure the company announces that it will absorb a loss at its own store of purchases made by married employees living with their families at Anyox in a flat reduction of 10 per cent on all purchases made there. It is planned also to reduce the cost of board with every two-cent reduction in the price of copper until a minimum of $1 a day for board is reached. Beginning with the price of copper at 21 and 23 cents the special 50 cent bonus will be reduced 10 cents therefrom for each 2 cent increase in the price of copper until the special provision for the present extraordinary cost of necessities is eliminated at a point where the scale rate being paid is on the basis of copper at 29 and 31 cents.

The statement continues:

"This decided action is made necessary by the resulting conditions following a world-wide disruption, over which this company or you men have but little control. It has been delayed in order to give ample time for consideration both by you and the company's executives. It is based upon the fundamentally sound principles of justice and equity between us, and an endeavor to enlist your co-operation in keeping our industry operating at a time when so many similar and Allied industries are reducing or closing down entirely. Its further effect is to resume an arrangement between you and the company which automatically, month by month, furnishes you a method of participating in the better price received for our production, but which at the same time limits your loss when adverse market conditions prevail, as is the case at the present time.

"We hope that the present conditions will be of short duration, and that the coming spring will bring an early resumption of former business on a healthy normal scale, that will afford a solution of the perplexities of re-adjustment that seems so difficult to attain just now."

Grand Forks, B.C.—The report that it was the intention of the Granby Mining & Smelting Co. to close down its smeltery at Grand Forks is not borne out by recent developments. Another furnace was blown in a short time ago, and there now are three in operation, while a notice has been bulletined at the reduction works to the effect that it is the intention of the management to "continue operations as long as possible." With the posting of this notice announcement also was made of a further reduction of 25 cents a day per man in pay, this being in accordance with the sliding scale agreement governed by the price of copper. It is stated in this connection, however, that Granby employees still are receiving 50 cents a day better than pre-war days, and there is no disposition to find fault.

Minimum Wage for Coal Miners.

There has been some speculation as to the object of the Minimum Wage section in the amendments proposed by the Minister of Mines to the Coal Regulations Act of British Columbia. The consensus of opinion is that the intention is to drive the Chinese miners out of the coal mines of the province. In a few of the mines, it is stated, Chinese are employed at the faces, which is keenly resented by the white miners. It is the opinion that if the board, which the Government would have appointed, were to fix a minimum wage in district where this condition exists the effect would be to make it as economical to the company to employ white men and, as there is no doubt that the latter are much preferred, other conditions being anywhere near equal, the Orientals would be removed. When asked whether this was the explanation of the measure, the Minister of Mines had nothing to say. That the presumption is correct is further confirmd by the fact that the contemplated Minimum Wage Board is to be given power to denote special districts to which an investigation may be applied and for which a minimum rate of wage may be fixed.

Legislation re "Closed Towns."

The Act which proposes to open to some extent what are termed "closed towns" in British Columbia, and which applies to such centres as that of Anyox, the industrial community of the Granby Consolidated Mining & Smelting Co., was explained by Hon. T. D. Pattullo, Minister of Lands, the other day in opening the debate on the second reading of the measure. He said that the provision of the Bill had already been practically brought into force as to the town of Ocean Falls, by the terms of an agreement between the Government and the Ocean Falls Pulp Company. The Bill, he said, would give the right of entry to the communities affected to the public, though the actual ground covered by the works of the company would not be open any more than it would be in any other community. Major McIntosh, a returned soldier and member for the City of Vancouver, welcomed the measure, but thought it should go further. He understood that in some, if not all of the company towns the companies carried on all the business therein. Provision should be made permitting others to engage in business, which would give the returned soldier an opportunity. He had heard that some such towns were controlled by American firms, which sold only American goods to its employees, thus barring Canadian products. Mr. J. H. Hawthornthwaite, a Socialist Member, favored the measure, stating that laboring men were indignant over the continued existence of "closed towns," wherein the ordinary privileges of British subjects were denied them. Mr. J. W. deB. Farris, Attorney-General, sympathized with the workingmen on this question, but doubted whether it was possible to go any further. Under the Land Act it was provided that the Government might take over a one-quarter interest in townsites, but it was a question whether such industrial communities could be classified as townsites under the Act. Some towns were located in such peculiar physical conditions that it would be most unjust to step in and take one-quarter of the ground, thus seriously interfering with plants on which millions of dollars had been spent. He said that, under the legislation proposed, working men could go in and organize the workers if they saw fit.

From Anyox comes the report that the contemplated Bill does not meet wit hthe approval either of the men or of the company officials. The statement attributed to Mr. Hawthornthwaite that the employees live in "slave pens" is resented strongly, it being stated that they have first-class housing accommodation. It also is pointed out that during the war Anyox sent nearly 300 men to the war, and that at the last Victory Loan Drive Anyox subscribed more than half a million dollars, having a greater per capita of subscriptions than any other point in the Dominion of Canada. Not content with its pre-war record, Anyox is taking back every returned soldier who had a position with the company at the time of his enlistment, the general order being "a place must be found for every returned man."

The cost of living at Anyox, it is stated, during the past four years has been cheaper than any place similarly situated, either in the United States or Canada, owing to the fact that large supplies are purchased and resold to employees on such a basis that every year shows a deficit in the storekeeper's accounts, which loss is absorbed by the company. It is asserted that the statement of Major McIntosh that American supplies are bought in preference to those of Canadian origin is not correct. Such a condition is said to be unreasonable when it is remembered that there is a differential of 35 to 40 per cent on duty on such supplies. A prominent company official is quoted in this connection as saying that there is not an item of purchases made by this company outside of Canada that can be filled within the confines of the Dominion. Aside from certain machinery which is not manufactured in Canada, not a penny is spent for supplies in the United States which can be purchased here."

Horn Silver Mine.

Some fine samples of gold-silver ore have been brought from the Horn Silver Mine of Similikameen Valley by Mr. E, W. Condit, the manager. This is the largest gold-silver property of the Province. Work has been in progress there for three years and, during development, the mine has paid its way, producing 45 cars of ore which were shipped to the smelter at Grand Forks. The samples referred to are mainly argentite, 86 per cent silver, and the gold values amount to one ounce to every 300 ounces of silver. The ore extracted to date is valued at $69,000. Mr. Condit states that it is the intention to install a concentrating mill at the mine.

Silversmith Mines, Ltd.

Mr. Oscar V. White has resumed his former position as general superintendent of the Silversmith Mines, Ltd. He also is acting for Mr. Clarence Cunningham in directing operations at the Wakefield mine, near Silverton.

Developments in connection with the Silversmith continue to be encouraging. In a report received by local shareholders in the Rambler-Cariboo Mines, Ltd., regarding the operations of that property from May 1 to December 31st, 1918, it is shown that the earnings were at the rate of $3,000 monthly, or for the eight months approximately $24,000 net. As this was in spite of a serious snowslide, which swept away much of the tramway equipment and necessitated two months of reconstruction, the showing is considered satisfactory. W. A. Cameron, the mine superintendent, reports as follows: "During the period covered by the report (8 months), we have mined and milled 5,400 tons of material, from which we have produced 400 tons of lead concentrates. No shipments of crude lead were made. The concentrator was in operation six months. The other two months we were repairing damages caused by snowslides last spring. Owing to the scarcity of labor and the high cost of mining there was only 200 feet of development driven. This work consists of two raises. One from 1,300 to 1,200, and one from 1,200 to the level above. In the raise from 1,200 we have opened up a nice body of mill-feed, containing very good silver and lead values. The raise of 1,300 went through some small bunches of zinc with very little galena through it. We hope to open up some more ore off this raise, carrying better lead values, but so far the ore in here has not sufficient lead in it to make it of very much commercial value. In making an estimate of the amount of ore developed, I believe we have between twelve and fourteen thousand tons of mill-feed in sight, or sufficient to keep the concentrator in operation for over a year."

MINE WORKERS CONVENTION AT CALGARY.

The annual convention of District 18 of the United Mine Workers of America took place at Calgary, Alberta, during the week February 17th to 22nd inclusive, there being 64 delegates, of whom five were Great War Veterans, present.

One of the first important questions discussed was the problem of the re-establishing in civil life of the returned soldier. In this connection it was thought that this difficulty would be simplified in a measure by the shortening of the hours of labor. Three thousand of the miners of the District had joined the Canadian military forces and there were at present, it was said, two thousand miners without work. President-elect Christopher asserted that the conditions rendered the nationalization of the industry imperative.

After considerable debate the following self-explanatory resolution was carried:

"That this Convention goes on record as demanding for the returned men of the army and naval forces. that their membership in our organizations be held continuous, and that they be reinstated at the same class of labor in and around the mines where they were employed before enlisting or taking service in the army and naval forces; also that they should be given preference of employment where men are bing employed;

"We further recommend, realizing that the interests of the mass of the returned men and that of the body of Organized Labor are identical, that the District Executive Board be empowered to enter into negotiations with the representatives of the returned soldiers to consider means whereby justice may be secured for them—the returned soldiers — not at the expense or sacrifice of the worker, but as an act of true justice on the part of the nation, and that this Convention pledges itself to support any programme or adopt any means necessary to secure that end."

There was considerable discussion as to the merits and the demerits of the contract system of labor in the coal mines. The Corbin Local Union wished the Convention to insist on the abolition of the contract system; but it was pointed out by the international delegates present that, if this drastic resolution were passed, District 18 could not count on financial or other support from the international body. Finally a compromise was reached by the Convention going on record as opposed to the contract system. It is understood too, that all the local unions of the American continent will be circularized on this question.

It is stated that any suggestion that the objects of organized labor, as represented on this occasion, might be considered of a Bolshevist nature, was resented by the majority of the delegates. While some hold advanced socialistic opinions, which they are not backward in voicing in the heat of discussion, the following paragraph contained in a statement made by Robert Livett, an International delegate, was generally endorsed:

"The first step of the present workers towards reconstruction of society must be political. By this means we will be able to settle industrial conditions on a basis which will bring a fuller and better life. Reconstruction cannot be achieved by more trade or by a six-hour day, but must be gained by control of political power; that power in the hands of the workers can stop robbery and institute the production for the use of all; reconstruction will then be complete."

It may be stated incidentally that there is a strong sentiment in favor of the withdrawal of District 18 U. M. W. of A. from affiliation with the American organization and the establishment of a self-contained and independent Canadian body.

Coal Rights on Vancouver Island.

Some interesting new facts were brought to light by Hon. William Sloan, Minister of Mines, in speaking before the Provincial Legislature to the "Settlers' Rights Act, 1918," which proposes giving those holding property within the Esquimalt & Nanaimo Railway Belt, Vancouver Island, a further opportunity to make applications for their coal rights on the land to which they have surface title. He stated that there were some forty-five or more applications for such coal rights dealt with under the Settlers' Rights Act of 1904, which measure first opened the question by legislation, and that altogether Provincial Titles had been granted to 7,166 acres of coal bearing land within the boundaries of the railway holdings on the Island. Mr. Sloan pointed out that when the railway was first given title to these Island lands it had been granted an additional 86,346 acres to recompense it for property which had been alienated to settlers prior to 1884. He stated that to repay the company for the 7,166 acres of coal bearing land taken subsequent to 1904 another 20,000 acres had been deeded to the company. Of the total 2,210,000 acres which, it was computed, was included in the E. & N. Ry. Belt it was roughly estimated that there were 356,000 acres of a coal bearing character. It followed that there still remained to the E. & N. Ry. company or its successors some 366,000 acres of coal bearing lands.

The debate on the proposed 1918 Act is still in progress, but it is considered likely that it will be carried. Under its terms the settlers, or their heirs, will be allowed to apply for the coal rights on their lands and, if successful in proving that they have a legitimate claim, will be issued Provincial Titles. All this, however, is contingent on the stand taken by the Dominion Government. The latter exercised its prerogative last year and vetoed, or disallowed, the 1917 Act which was of an exactly similar nature. The contemplated action of the Provincial Government in taking the earliest opportunity to re-enact the legislation which, apparently, is repugnant to the Federal Administration has created an interesting situation. It would seem that a determined fight has been launched between the Province and the Dominion, it being the contention of the former's Government that the Dominion is infringing the authority of the Provincial Legislature in assuming to dictate on a subject affecting nothing more than "Property and Civil Rights." Jurisdiction to handle all matters coming under that heading was clearly allotted to the Provinces under the Terms of Union.

Considerable interest is manifested in British Columbia in the stand taken by the Canadian Mining Institute in deciding to urge upon the Dominion and the Provincial Governments of Canada the necessity of establishing a higher scale of wages to the technical workers in government departments. In deciding upon this course President D. B. Dowling suggested that Canada's vast natural resources would be developed to a greater extent than before and that the mining man might be expected to come into his own in the immediate future.

Fire at Anyox Smelter.

Fire broke out on Sunday, March 2nd, at the Anyox (B. C.), smelter of the Granby Consolidated Mining & Smelting Company's plant. It started at one of the converters and spread under the force of a northeast gale to the smelter proper and the ore bins. The loss is placed at approximately $50,000. The Anyox Fire Department was successful in checking the conflagration before it got a grip which might have been disastrous in its consequence. Repairs are in progress and it is expected that the plant will be in shape to permit full operation by the 15th of the present month.

Gold Crown Mines.

The Gold Crown Mines property, which is situated at Kleanza Creek, near Usk, and the ore of which contains good values in gold, copper and silver, may be developed this year. An American syndicate, which is represented by Mr. John Willman, is negotiating with the Government for the use of the water power of Kleanza creek. The water power is leased by the Cassiar Hydraulic company, which has not been operating for two years, and it is thought likely that a transfer of the lease will be effected. The Lucky Loop Group of Claims, owned by Messrs. Moody and Lowrie, has been leased to Messrs. Seeber, Roark, and McMann, who have been working steadily all winter. They have put in a 100 ft. tunnel and have a carload of hand picked ore ready for shipment. The values are expected to run to $10 in gold and $50 in copper at present prices. On the "Old Hickory" Mine drifting is to be continued this season by Mr. A. L. Kelch, who is returning from California shortly. A 200 ft. tunnel has been driven which shows up three feet of bornite and chalcopyrite ore. Messrs. French and Thompson, of the Kitselas Mountain Copper Company are expected to instal a concentrating mill at the mine this summer which will be of value of the development of this property and a boon to the owners of smaller properties in the district.

Developing Copper Deposits on Vancouver Island.

The development of a number of promising copper properties of Vancouver Island, B. C., is to be actively continued this summer. Generally speaking the policy of operators appears to be to proceed with the opening up and the blocking out of the orebodies in sight with a view to be in a position, with the readjustment of market conditions, to take immediate advantage of the improvement. Spokane operators were in Victoria recently examining one of the East Sooke properties, which are situated twenty-five or thirty miles out of the city. They are expected to be able to reach an early decision as to investment. A quantity of high-grade ore, and a large quantity of lower grade ore, have been blocked out at the Sunlock Mine, Jordan River. Reports from the Alberni District are favorable. Very little ore is expected to be shipped this year from the Dwedney Mine, Sidney Inlet, but it has been decided to proceed with the improvement of the concentrating facilities. The enlarged plant is expected to be ready by the month of August, and the production this year will be held for more favorable markets.

Copper at Head of Gun Creek.

Lillooet, B.C.—The discovery of a copper area at the head of Gun Creek on Copper Mountain in the Mackinnon Mountain Range, is reported, and it is stated that the deposit has been examined by Mr. Charles Camsell, of the Dominion Geological Survey Department, whose account of the same will be published shortly. Mr. Camsell visited the locality last summer, and is said to have formed a very favorable opinion of its possibilities. The survey made shows an orebody 800 feet wide by 2,500 feet long, exposed to a vertical depth of 200 feet, and is estimated to contain 30,000,000 tons in the exposed portions of the orebody. The ore, the accounts say, is of a higher grade than is usual in this Province. A sale is pending which, it is expected, will mean the development of the property in a large way.

WHY CHANGE THE NAME?

There is now before the members a proposal to change the name of the "Canadian Mining Institute." Those who support the proposal say a change in name is desirable in order to indicate that the activities of the Institute cover the field of metallurgy, and they submit the name "Canadian Mining and Metallurgical Institute" as one that more fittingly covers the activities of the Institute.

Some members of the Institute who have little to do with the finding of ore deposits, their exporation, development and mining, or with ore dressing, seem willing enough to use the term "mining" in a general sense to cover everything in the mining industry except metallurgy. Some of our metallurgists like to consider their work as distinct from that of mining, and they favor the inclusion of the word "metallurgy" in the name of the Institute. The wishes of these men must be given due consideration. In fact, the desire of the metallurgists is properly the argument in favor of the proposed change. We would point out, however, that a change made to please some metallurgists may lead to unexpected difficulties.

By long custom the term "mining" has been used in two senses; first: as a broad general term concerning the whole industry from prospecting to marketing the refined product; second, in a restricted sense referring to the actual extraction of the ore. As used in the name of the Canadian Mining Institute and in most references to the mining industry and mining companies, the word includes a great variety of activities such as prospecting, mapping, sampling, stripping, equipping with machinery. developing, drilling, pumping, surveying, mining, hoisting, sorting, crushing, transporting, milling, concentrating, cyaniding, roasting, smelting, refining, etc. The processes in connection with gold, nickel and iron ore are in many respects quite different. Even greater are the differences between coal and silver mining. The terms coal mining, silver mining, nickel mining, are used to cover all the processes leading up to the preparation of coal, silver and nickel for the market.

It would, perhaps, be well if the word mining were not used in a special as well as in a general sense. Since it is so used, however, we may as well recognize the fact. We certainly need one word for the industry, and every attempt to decrease the certainty of the meaning of that word is objectionable. If we change the name Canadian Mining Institute to Canadian Mining and Metallurgical Institute we may please a few metallurgists; but we will have to find a new name for the mining industry. As soon as the word "metallurgy" is added to the name, the meaning of the word "mining" is changed. We have a useful and all inclusive name that covers all branches of the industry from oil well drilling to blast furnace practice. Should we give it up?

Principles of Mining Taxation*

By THOS. W. GIBSON.

The object of taxation is the raising of a revenue. Unless a tax accomplishes this, it is a failure. The right to take for public purposes a part of the moneys obtained from the carrying on of private enterprises is an attribute possessed only by a lawful government, and may indeed be called the supreme attribute of government.

In free, democratic communities this power must of necessity rest upon the just consent of the governed. Powers imply obligations, hence it is obviously the duty of a government in framing a system of taxation to provide one which, while effective in producing a revenue, is also just and impartial. It will be conceded that mines and mining property ought to bear a fair share of the public expenditure. The question is, upon what basis taxation should proceed.

Two separate taxing principles are usually contended for: (1) Taxation should be proportionate to the benefits received by the person or property taxed; (2) Taxation should be based on ability to pay.

A third is sometimes added; (3) Taxation should have reference to the extent and value of the natural resources enjoyed.

As applied to mining taxation, it is pointed out by those who support the first-mentioned basis, that mines being usually situated in rocky and hence sparsely peopled regions, mining companies are frequently obliged to construct roads, railways, telegraph and telephone lines, schools, water and sewerage systems, and many other amenities and conveniences of civilization, the cost of which in regions better suited for agriculture and consequently more thickly populated, has either been defrayed locally, or can be spread over a sufficiently large taxable group of people to materially lighten the financial burden on the mine. The mining company, it is argued, having made these outlays, should receive credit for them, and be relieved of taxation to a corresponding extent.

There may be some force in this contention, but the situation is capable of relief without attempting to place taxation upon so unworkable a basis as the value of benefits received. Who is to be the judge of these benefits, and how are they to be valued? The very existence of a mining company, and its ability to carry on business in peace and security, depend upon the prevalence of law and order, which is a result of good government. The state provides protection against violence, and courts of law for redress against wrong. The relationships among the social units of a modern well-governed state are so complex and interdependent as to make it impossible to fix with any degree of accuracy the money value of the services rendered by the whole, or in other words, the government, to any one unit.

Again, the state existing for the benefit of the individual units and extending its care and protection to all, it follows, in so far as property is concerned, that the greater the value the larger are the benefits which its owner derives from the state, and consequently the greater the tax he should pay. It would seem, therefore, that basis No. 1—benefits received—really occupies the same ground as basis No. 2, ability to pay.

The latter basis pre-supposes the possession of capital productively employed, for it is obvious that taxes could not long continue to be paid out of capital which remained unreplenished. Any tax upon legitimate industry which diminishes the amount of capital available or necessary for that industry is objectionable, for the reason that its effect must be to cripple, or in the end even to extinguish such industry. Moreover, the only source out of which an unremunerative enterprise can pay taxes is its capital. These considerations bring us at once to a recognition of the fact that the burden of taxation can properly be placed only on net earnings or profits.

Adverting to the third ground for taxation previously mentioned, namely, the value and extent of the natural resources owned or controlled, it is clear that this is a suggestion for the taxation of monopolies. Natural resources, though great, are limited, and cannot be equally enjoyed by all. A water power easy of development and capable of supplying electric current for a considerable body of people, becomes, let us say, the property of an individual or company. The owner being without competitors, is able to raise his charges to the highest point, which would probably be the level at which energy could be generated by steam or brought in from elsewhere. Few will deny that such profits are a fair subject of taxation.

In a real, though not in so complete a sense, the possession of a valuable deposit of ore constitutes a monopoly. All land does not contain mineral values; indeed, the proportion of valuable mineral land to the entire surface of the earth is very small, and the owners of mineral deposits are monopolists in the sense that they enjoy this advantage over the great majority of their fellow beings. Where such advantage enables them to make unusual profits, taxation is amply justified.

In the case of basis No. 3, what is really put forward for taxation is not so much the monopoly, real or fancied, as the profits which it ensures to the owner, and its application logically leads to the same conclusions as those drawn from basis No. 2, or even basis No. 1.

Now, mining is a business more than ordinarily subject to uncertainty of result, and if the capital invested in a mine is to be in danger of serious depletion by means of taxes, because "Dame Fortune's fickle smile" has not been won, the effect will not only be disastrous to the particular mine, but deterrent upon the engaging of capital in mining enterprises generally. On the other hand, it is true that mines are sometimes profitable on a scale far beyond that of an ordinary commercial business. I need not stop to multiply instances. The copper mines of Michigan, Montana and Arizona; the silver bonanzas of Virginia City and Cobalt; the gold mines and diamond diggings of South Africa, and the nickel deposits of Sudbury, will occur to your minds. Returns such as accrue from deposits like these are the sustaining force of the mining industry, and enable

*A paper presented at the Joint Sessions of the A.I.M.E. and C.M.I., New York, Feb. 17, 1919, and Montreal, March 6, 1919.

it to maintain a vigorous existence despite countless gross proceeds. These include wages of labor, superintendence, power, explosives, timber, transportation, expenses of marketing, administration, and similar charges. Depreciation of mine buildings and plant should be allowed for, on a basis that will amortize their cost during the lifetime of the mine. Mining machinery is valuable only so long as the mine is in operation; when the ore is exhausted it rarely has more than a scrap value.

Initial capital really invested, carefully distinguished from water, should be exempt from taxation, as until it is returned either in dividends or some other form, profits in the strict sense of the term cannot begin. By initial capital is meant the money invested in purchasing the land from the government and in opening up and equipping the mine. It is apparent that should the property be subsequently sold for a larger sum, it would not be equitable, so far as the state is concerned, to treat the additional cost to the new owner in a similar way, for the increase in value simply represents a capitalization of future profits, the express object of taxation.

Opinions may differ as to whether dividends to shareholders should be reckoned among the expenses of operation, and so go untaxed. It is not the practice of shareholders to refrain from dividing the profits of a paying mine until the entire capital investment is amortized, but rather to require a distribution to begin at the earliest possible moment. Prudent management, in most cases, will be satisfied if a yearly sinking fund is provided sufficient to wipe out capital before the exhaustion point arrives, and there is no unfairness in the state's request to be treated on the same basis as the shareholders themselves, and to require its tax to be paid out of the gross sum of net earnings, irrespective of dividends altogether. It may happen that the company instead of distributing its profits in dividends, will reinvest them wholly or partially in enlarging its operations or in new or improved machinery and equipment, or even in the purchase of additional properties. The destination of profits or the purposes for which they are used, being wholly within the control of the company, should not affect the right of the state to its share.

A more fundamental question in dealing with mining taxation, whether on the net profits, ad valorem, or any other plan, is provided by the fact that the assets of a mine are in the nature of things vanishing assets. The first bucketful of ore raised from a mine marks the beginning of the end. The rich storehouse which it has taken nature ages to fill is ransacked by man in a few years. Fairness requires that this special feature of the mining industry should be given full weight in any system of taxation.

This would not be a difficult problem if the end could be foreseen from the beginning, and if the years of a mine's life could, like those of a man's life, be estimated by actuarial methods. Borings, shafts and cross-cuts, in the case of large homogeneous masses such as bodies of iron or copper ore, may give reliable data for such a calculation, but in many cases these methods, besides being expensive, are difficult of application and uncertain in results. Besides, while the drill is at work and reserves are being blocked out, ore is being raised and treated, shareholders are clamoring for dividends, and the state is asking for taxes. The most that can be done in many instances is to make a conservative guess and proceed accordingly, subject to adjustment as development goes on.

The practical problem, however, for taxation and dividend purposes, is not how long will the mine last, but how soon can the initial capital investment be recovered? After such recovery, the entire net proceeds of the mine may safely be regarded as profit and treated accordingly.

Usually, it will be the part of wisdom to make the period for capital replacement as short as possible. Pressure for returns is imperious and not to be resisted, consequently it is not the usual practice of companies to amortize formally their capital out of net earnings, but rather to pay these out as dividends. The effect of large dividends on the market value of shares is usual practice of companies to amortize formally their capital paying mining companies, is almost invariably too high, since investors overlook the fact that a mine, unlike a farm, cannot be worked forever.

It is sometimes urged that the taxation of profits should be equated over a period of years so as to avoid heavy fluctuations of revenue, which are inconvenient to the state or local body, dependent upon mine tax receipts for financing. It should be remembered, however, that especially in precious metal mines, the rise and decline of a property cover usually a comparatively brief period. A mine can best pay a large tax when it is earning large profits, but when the end is in sight and profits dwindle, the ability to pay is lessened. The adoption of a 5 or even a 3-year term, would undoubtedly tend to shift the high point of taxation to a later period in the mine's history, and might entail a burden on the closing years which they could not rightly bear. On the whole, it seems advisable to close the account at the end of each year.

The net earnings or profits basis for taxation appeals to the sense of fairness. If the mine is a failure, the state receives nothing; if moderately successful, the state gets a moderate return; if it proves a bonanza, the state revenue benefits accordingly. The incidence of taxation is better adjusted than under any other form. Experience has shown it to be acceptable to the mining community itself, which is a strong recommendation. The taxing authorities must of necessity be clothed with sufficient powers of enquiry and examination, and adequate penalties provided for offences. Given these, the difficulty of enforcement is reduced to a minimum.

The fact is that in any method of mining taxation, excluding those which are admitted arbitrary in their nature, the underlying principle is taxation of profits. This is borne out by an examination of the ad valorem system in vogue in many states of the Union.

State Constitutions almost invariably have imbedded in them a provision that all properties shall be assessed for taxation, and that taxation shall be uniform. This provision precludes any method of taxation avowedly based on output or profits, as well as a specific tax of any kind on mining property or products. In a few of the states the constitution permits specific taxes, but the prevalent basis of taxation is the assessed value of tangible property, to which a uniform rate of taxatian is applied. Ordinarily, the requirement is for assessment at the actual value, but in practice this provision is disregarded,

and in most cases the assessment value is less than the real value. Some states have regularised this disregard, and provide that the assessment shall be for only a specified percentage of the actual value. The valuation is made by the local taxing authorities, and is the basis upon which is levied both state and local taxation.

Many states have now a State Tax Commission, also a Board of Equalization, which may or may not be the same body. The assessment of mining properties by local officials is naturally far from uniform, and the function of the Equalization Board is to adjust the valuation to a common standard. It is obvious that while within the area of a local taxing unit, be it town, city or county, if the same rule of assessment be applied to all properties, it is a matter of indifference whether the basis is 50 per cent, 75 per cent, or the full actual value, for the same rate is applied to all. For purposes of state taxation, however, it would be inequitable to collect the same rate on properties in a town assessed at 50 per cent or 75 per cent of their value, as upon properties in another town appraised at their full value, hence the necessity for the process of equalizing.

But even in estimating the amount at which a mine of any magnitude should be valued for taxation purposes, it is evident that a degree of skill and experience is required, little likely to be possessed by the local assessor. Mere guessing at the value produces endless confusion and irritation. In some of the states of first-class mining importance, notably Michigan and Minnesota, the Tax Commissioners determined to adopt some more scientific method. The Michigan mines are of iron and copper. The ore-bodies are extensive and valuable. Local conditions, chiefly the fact that the mines are confined to the northern peninsula, and the farming lands of the state to the lower peninsula, led to perennial dispute as to the share of taxation which the respective sections of the state should bear. In 1911 the State Tax Commission employed Mr. J. R. Finlay to survey and value the iron and copper mines for assessment and taxation purposes. In making this valuation, Mr. Finlay applied five factors:

1—The tonnage of ore contained in the mine.
2—The estimated life of the mines.
3—The cost of operating.
4—The annual receipts from sales of ore.
5—The rate of interest for ascertaining the present value of deferred production.

The diamond drill is the distinctive tool for exploring the iron mines of Michigan. Most of the mining companies who have been operating for any length of time had delimited their ore bodies by borings, and had ascertained their approximate dimensions, and consequently the reserve tonnage. Their average production during the four or five years previous, divided into their ore reserves, gave the probable life of the mine. Operating expenses deducted from receipts from ore sales gave the profit per ton; this figure, multiplied by the average output, gave the yearly profit, or in other words, constituted an annuity payable until the mine was worked out. The present value of this annuity, discounted at six per cent, Mr. Finlay set down as the valuation of the mine for taxation purposes. Taking a concrete case for clearness' sake, let us assume that Mr. Finlay was valuating the Ferrum mine. On the basis of the company's borings and allowing for probable undiscovered ore, the contents were 10,000,000 tons. The average production was 500,00 tons a year, hence the mine had a future lifetime of 20 years. The average cost per ton for operating was $3.00, and the average for ore sold $3.50, leaving a profit of 50 cents per ton; this, on 500,000 tons of ore, would give an annual profit of $250,000 for twenty years, the present value of which was $2,867,475. This sum would be the valuation of the Ferrum mine.

Iron mining in Michigan has had its ups and downs. In 1914, when the great struggle of the nations broke out, the average loss per ton of ore to the mining companies was $0.07712, yet the taxes collected from them, based on Mr. Finlay's valuations, were equal to $0.12009 per ton. In 1915 there was an improvement, and the output of the iron mines in that year was 13,151,612 tons, and the average selling price was $2.79402 per ton. Much of the ore is mined subject to royalty payable to the owner of the fee, the average being $0.23136 per ton. Including the royalty, the average on iron ore was $0.52380 per ton; out of this margin the royalty charge had to be met, and in addition, taxes equal to $0.13784 per ton. That is to say, the net profit remaining to the mining companies, after allowing for certain other smaller items, was $0.14674 per ton. Thus, after deducting expenses of production from the selling price, nearly one-half of what was left went as royalty to the fee owner, and the remainder was divided almost equally between the mining company and the tax collector. Before payment of the royalty the taxes amounted to 26.31 per cent of the profits, after payment of the royalty, to 47.13 per cent. Measured by pre-war standards, this was a heavy rate of taxation.

Mr. Finlay's method has the merit of being systematic, and it takes into account the essential factors of value, but it is evident that no allowance is made for the unexpected. A demand may arise for iron ore far in excess of anything previously known, with a corresponding increase in price and consequently in profits. On the other hand, stagnation may set in, prices may fall, and iron ore may become practically unsaleable. In the former case the valuation of the mine, based as it was on normal conditions, is too low; in the latter, too high.

In Minnesota a similar method is in vogue, but a somewhat elaborate classification into productive and unproductive mines and prospects, with a varying standard of valuation in the several classes, has been worked out in the endeavor to arrive at equitable results.

The Finlay valuation of the Michigan iron mines gave them a total value of $129,000,000, which was a large increase over the total valuation under the old methods. The companies protested vigorously, and the Tax Commission reduced the valuation to about $90,000,000. At about this figure for a number of years, it remained practically stationary, the amount of ore brought in sight year by year about equalling the amount extracted.

In the case of the copper mines, the Finlay system had an entirely different result. The aggregate value reported was $69,000,000. This sum was so far below the value of the mining properties as shown by the market value of their shares, that the companies, fearful of bearish effects upon the stock market, demanded that their old assessments be restored. This

request the Tax Commission also granted, and the copper mine valuations remained at about their old figure.

Whatever may be urged in favor of the Finlay method of valuation as applied to the copper and iron mines of Michigan, and the iron mines of Minnesota, with their immense masses of ore capable of fairly accurate delimitation and ascertainment of quantities, and individually fairly uniform in quality, it is clearly inapplicable to deposits such as those of the precious metals, where the veins are small and subject to great irregularity in size and direction, and the value of their contents. The diamond drill cannot be depended upon to the same extent in disclosing the value of such deposits. There are other minerals of value notoriously pocketty and capricious in their habit; for all such the Finlay method is unsuited. Even where ore-bodies are large and of fairly uniform value, it could not in many cases be even tried, for the essential requirement in estimating tonnage, namely diamond drill borings on a sufficient scale, is lacking. Cases can be cited where mining companies, even after years of working, were uncertain or even ignorant of the size of their deposits. To take a notable instance from the Province of Ontario; the Canadian Copper Company working the Creighton nickel mine, were apprehensive that its productive limits were being reached, and consequently prepared to exploit the Frood mine, another large ore-body, but lower in nickel and copper contents. They built a town, laid out streets, equipped the new mine with machinery and hoisting plant, and began to work it. Concurrently they continued to explore the Creighton by diamond drilling, and encountered at lower depths unexpected and very large reserves of ore. It paid the Company to cease all work at the Frood, and to continue operations at the Creighton. Had a valuation been made of the Creighton mine on the Finlay plan before the reserves were disclosed, it would have fallen far short of the correct amount.

Undoubtedly one effect of the Finlay system in Michigan and Minnesota has been to discourage exploration for ore. As soon as the drill brings ore into view, it is subject to valuation and taxation, notwithstanding that it may not be actually worked for years. Every prudent mining company desires to know its position regarding reserves of ore, so that it may be justified in making adequate capital expenditures for the winning and treatment of the same, but if to establish new ore bodies is to materially increase their taxation, the result is apt to be a slowing down of the drill.

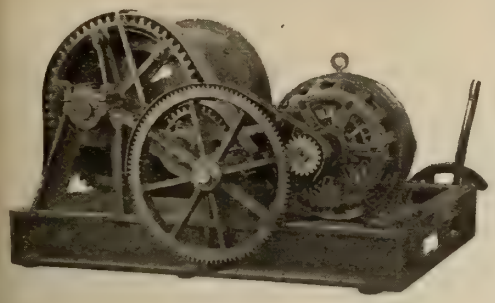
It is apparent that the Finlay and practically all other methods of mine valuation in the end rest on profits. Unless a deposit can be worked so as to yield a return greater than the cost of working, it has no real value. The controlling factor is the profit per ton or other unit of production. The sum any mine is worth depends upon the profit it is producing, and will continue to produce. When the object is revenue, not a sale, surely the more logical way is simply to tax the profits as they are realized. Since these cannot be accurately predicted, they cannot be accurately capitalized; nor is there any occasion to do so, for if they prove smaller than was expected, the tax is less and no injustice has been done; should they prove greater, the tax is larger in proportion. The net profit system automatically adjusts itself to the conditions for the time being, and takes account of all changes in expenses and returns.

Other methods than the taxation of profits have been attempted. One of these is an area tax— so much per acre, hectare, etc. This is a rough and ready method, and has no relation to value or ability to pay. An acre of barren rock pays the same tax as an acre of diamond-bearing earth, or of the richest quartz. A second method is a specified rate per unit of mineral, be it ton, pound, ounce or gallon. This has the same convenience of application as the acreage tax, but takes no account of profits or expenses. A ton of coal scraped from the last workings of a mine would pay the same rate as a ton produced from the richest and most easily worked seam; an ounce of gold wrung from ore carrying $2.00 a ton at a profit of ten cents, will pay as much as gold from $50.00 quartz; a gallon of petroleum from a well yielding a barrel a month, as much as a gallon from a gushing geyser. Such methods of taxation are easily applied, but are unscientific, and lack the essential feature of fairness.

There was an improvement in tons of ore shipped to the Trail Smelter during the week ending February 28, the total being 7,386 tons as compared with 6,921 tons during the previous week.

Cost of Coal in Vancouver.

There has been a revival in Vancouver of the agitation against the coal dealers because of what is termed the excesive cost of fuel to the consumers in view of the fact that the coal mines of Vancouver Island, the source of supply, are only some sixty odd miles distant. The discussion arose through the statement of T. Bulger, Dominion Fair Wage Officer, that the island miners obtained their domestic coal for $4.50 a ton with an extra dollar a ton for delivery. This was the same coal which was selling in Vancouver for $10.15 a ton. The dealers declare that their profit at the latter selling price is not more than from 40 to 47 cents a ton. They say that they buy their coal at $6.45 or $7.20 a ton loaded on the scow at Vancouver Island, but that added to that figure are such expenses as freight charges, insurance, unloading, screening, sacking, and delivery. These items, with the wages of all engaged in the operations at from $4 to $5 a day and a loss in screening of from 10 to 15 per cent., accounted for the difference between the purchase price at tidewater on the Island and in the cellars of the consumers. If the coal miners were getting their coal for $4.50 at the pit mouth the opinion was expressed by the dealers that they must be obtaining it at below cost. It was further explained that the reason that some dealers were able to sell at $10.15, and other were forced to charge $10.50 a ton was that the Fuel Controller had issued an order requiring the Canadian Western Fuel Company to sell at not more than $6.45 per long ton loaded on scows, while the Canadian Collieries (D), Ltd., were permitted to dispose of their coal at a higher figure, which they had fixed at $7.20 per long ton on scows. This decision had been reached after an investigation into the cost of production in the cases of the different collieries of the Island. The dealers' contention is that the prices to the consumers are based on expenses and a profit to them of not more than from 40 to 47 cents a ton.



MINE HOISTS—Steam, Electric or Belt. MINE SKIPS—Any size or capacity.

Any kind of Mine Hoist you want up to 50 H. P., built the way you want it.

Safety Buckets and Cages also made to order.

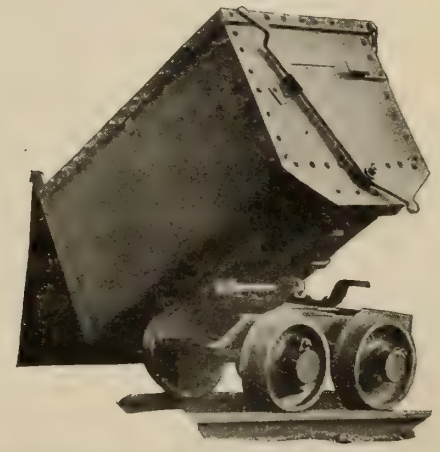
Marsh Engineering Works, Limited

ESTABLISHED 1846

BELLEVILLE, ONTARIO, CANADA

Safety
MINE CAGES
made to your liking, and to fit your shaft

STEEL BUCKETS
made any design, and any size or capacity, to suit your needs



ROTARY MINE CARS: Roller Bearing
Will dump at either side or end
Made in a large range of sizes and capacities
We also make any other style of small car required by the customer

Canadian Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

FOR SALE

FOR SALE OR RENT.—1 Steam Hoist 7 x 12 Beatty double drum complete with boiler 100 lbs. pressure. 1 Vertical Boiler with all fittings, 25 H.P. 100 lbs. 1 Air Compressor, belt driven, Chicago pneumatic 12 x 300 cu. ft. at 100 lbs. 2 Cement Guns complete with all accessories. 1 McLaughlin Auto Truck new stake body. 2 Air Compressors, belt driven, Bury, 650 cu. ft. at 30 lbs. Burns and Roberts, Toronto.

WANTED.

WANTED—Ball Mill. Capacity about 50 tons per 24 hours. Preference given to Marcy Mill. Monarch Metal Company, Limited, Main St. W., Hamilton, Ont.

POSITION WANTED: Experienced Rope Splicer — both Steel and Manila Rope. Years at Aerial Tramway work. Best of references. Box No. 1, Canadian Mining Journal.

POSITION WANTED as Superintendent or Manager for Gold, Silver or Iron Mine. Also Assessment Work. Mining Properties for sale at Boston Creek. Capt. Albert Johnston, Boston Creek, Ontario.

Readjusting Wages at Anyox.

Announcement is made that the employees of the Granby Consolidated Mining & Smelting Co. at Anyox, B. C., who number approximately 1,200 men, have decided, after deliberating for six days over the company's proposal to return to the sliding scale of pay with certain other concessions, to reject such an arrangement for the continuance of the work of the smeltery. The vote showed a majority of only 19 in favor of refusing the terms offered. As a result the plant has been shut down and the men are losing at the rate of $7,500 daily in wages. There has been no trouble in the camp and it is hoped that in a few weeks, perhaps by the time the damage caused by the recent fire are repaired, an amicable settlement will have been reached.

THE GOLD MINES.

Slowly but surely the value of gold is increasing, the reason being that it is costing less to produce gold. Slowly but surely the cost of material is growing less, and, as the yardstick of commerce, an ounce of gold is worth more because it will noy buy more. Slowly but surely the efficiency of the mine workers is increasing, and as each man will now handle an increasing tonnage of ore each day; it follows that each man is producing gold at a greater rate than formerly, and the same wage for which he worked during the time when inefficiency caused curtailment at not a few gold mines.

Why Waste Coal When It Costs So Much?

THE COCHRANE METERING HEATER TELLS HOW MUCH YOU ARE GETTING FOR YOUR MONEY.

How many pounds of coal do you use to produce a thousand pounds of steam? 200, 150, 100 or less.

A Cochrane Metering Heater will tell how many pounds of water are evaporated per pound of coal, and it will instantly show any improvement in evaporation due to better fuel, better methods of firing, better condition of heating surfaces (removal of soot and scale), better condition of boiler setting (stopping up air leaks), etc.

"TESTED"
The Last Word in Rock Drills

TESTED—the clinching quality or proven durability—means much to rock drill users. It means sure service—a long life for the Drill—and durability wherever used, with no long stops for repairs, because it is proven service.

Hundreds of Cleveland users after a long service of constant use against all conditions have sent back the verdict that for durability, labor and time saving "Cleveland" excels all.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

OUR PLATINUM AND PALLADIUM OUTPUT.

As pointed out by the "Toronto World," the recent reports of the Mines Department, Ottawa, and the Bureau of Mines of Ontario give little information concerning our production of platinum and palladium.

In the tabular summary of mineral production of Ontario for 1918, platinum and palladium do not appear at all, in spite of the fact that Ontario is a very large producer of ores containing these metals. We understand that the reason for this omission is that producing companies are not required to make the necessary returns.

In the tabular statement on mineral production of Canada, palladium does not appear, while the production of platinum is given as 39oz. This is, if anything, worse than the Ontario report for it gives the impression that the production of platinum has been reported and that it is only a very small amount.

In his notes on the various metals, however, Mr. McLeish, who compiles the Dominion statistics on mineral production says: "The recorded production of platinum in 1918 was 39 crude ounces (25 fine ounces) valued at $2,560, as against a production in 1917 of 57 crude ounces, valued at $3,823, and was all obtained from the placer gravels of the Similkameen district, British Columbia.

"Undoubtedly the most important sources of the metals of the platinum group in Canada are the nickel-copper ores of the Sudbury district, in Ontario, which are smelted at Copper Cliff and Coniston, and refined at Port Colborne, Ont.; New Jersey, United States; and Wales, Great Britain. A definite record of the total recovery of the metals of the platinum group and of gold and silver from these ores has not been obtained. Unquestionably there is, at least, a partial recovery of these metals in connection with the refining operations."

Why is there no record of output of platinum and palladium?

AN EXPLORATION SCHEME.

The "Winnipeg Telegram" in an editorial on March 18, proposes that the Government should undertake a survey of the mineral resources of Western Canada. The scheme involves the engagement of a hundred or more mineralogical experts by the Government, each to be sent out in charge of a party of returned men previously given educational training in prospecting by a three months' course in the university. The country would be divided into sections and the work carried on systematically. It is argued that the country might in this way provide remunerative occupation and vocational training for a large number of returned soldiers.

We agree with the "Telegram" that a more systematic and detailed survey of our mineral resources is needed and that it should be undertaken as soon as possible, as every day that development is delayed means a loss to the country.

To put into effect such a proposal would, however, necessitate a great change in the Government's attitude with regard to the employment of technical men. The present policy of the Government is to discourage technical men from entering its employ. The present employees of the Mines Department receive ridiculously small salaries, considering their qualifications. So long as the present rate of pay continues we need expect few applicants for such positions. If the Government is unwilling to pay adequate salaries for competent men to take charge of such explorations as proposed, the work would be done in an unsatisfactory way.

THE ROYALTY ON ORES.

In commenting on the weak points of the present mining regulations applicable to lands administered by the Department of the Interior, The Pas Herald says: "Another point in the Dominion regulations that scores heavily against them, is the royalty upon ores produced from these lease-held claims. The amount of royalty is not stated, and is to be fixed by the minister as he thinks best. This is an outstanding bad feature of the regulations, and is in itself quite sufficient to make capital chary of coming in."

There is good ground for this criticism. The Minister may have the best of intentions and may never impose unresanoble royalty. We have no good reason to assume that he would so discourage desired development of our mineral resources. But the failure to place a limit on royalties is tantamount to reserving the right to expropriate all profits. The mere fact that such a thing is possible under the law is sufficient to keep investors out of the country.

No law that does not recognize the hazard capital takes in development of mineral properties can be satisfactory. When a company develops one property successfully there is too often a demand that the operators should not be allowed to make large profits. The public seems unwilling to admit that those who spend money in developing mineral deposits should be greatly rewarded if successful. Our contention is that the only justification for the large expenditures which are made for exploration and development is that those who are successful are well repaid for their enterprise.

If the Government reserves the right to impose heavy royalties, the odds against the prospector are increased. How can we expected anyone to risk money in developing prospects if there is no hope that any of the prospects will prove to be very profitable?

It is, of course, quite proper that those who make fortunes from the development of our mineral resources should contribute largely to the public treasury. They expect to do so. But if the venturesome are discouraged there will be little development and our mineral deposits will be idle until a wiser generation sees that laws which cause delay in development are costing the country great loss.

The parts of the country whose mineral resources are administered by the Department of the Interior are not being developed as rapidly as they should be. If the Department is anxious to see that development is speeded up, it should see that objectionable features of the regulations are altered.

THE PROPOSED MONOPOLY OF WESTERN OILFIELDS.

Some time ago the Shell Transport and Trading Company made an application to the Department of the Interior for exclusive rights to explore a quarter of a million square miles of land in Northern Alberta and part of the North West Territories. At the termination of five years after declaration of peace the company would select 25,000 square miles of this territory for its own purpose. We understand that the first proposal was turned down; but that another attempt to put over this preposterous scheme is being made. It has been intimated that the proposal is considered worthy of consideration.

We do not wonder at the Government entertaining a proposal that would seem to provide a way for more rapidly developing our resources. It is the duty of the Government to speed up development if it can. We strongly object, however, to any such scheme as this. Companies that will not conform to our regulations should not be given any special privileges. We do not believe that our mining regulations are perfect, but we do believe that all who wish to develop our mineral resources should be governed by those regulations. The regulations need some amending; but Canada should not countenance the granting of special privileges to any company.

Strangely enough it is possible for our government to grant such proposals as are asked for by the Shell Transport and Trading Company without any proper consideration of the merits of the proposal and without any publicity. By order-in-council the monopoly could be granted without anyone outside the Council having a chance to object. The Government does not even acknowledge that it owes it to the country to obtain the opinion of qualified men as to the merits of the proposal.

Under the circumstances it is impossible to learn what is going on at Ottawa. From what information has leaked out it is obvious that there is a good chance of our Government making a serious mistake in this matter. Those who are responsible will do well to consider whether they should place so low an estimate on the value of public confidence. To restore confidence there is needed a declaration of policy. We would like to see an announcement from Ottawa that the Council disapproves of such action as is contemplated in the proposal of the Shell Transport and Trading Co. Less order-in-council government in all matters relating to disposal of natural resources is to be desired. It is bad enough to have mining regulations subject to order-in-council changes, but it is far worse to ignore those regulations when it is desired to favor certain companies.

UNITED STATES WILL PAY FOR LOSSES INCURRED BY "WAR MINERALS" PRODUCERS.

Former Senator J. F. Shafroth, of Colorado, Philip M. Moore, St. Louis, Mo., and former Representative M. D. Foster, of Illinois, were appointed by Secretary of the Interior Lane as members of the commission that will have charge of the payment of the losses incurred by mining men in the production of manganese, chrome, pyrites, and tungsten for war purposes.

During the war the Interior Department, the Emergency Fleet Corporation, and the War Industries, War Trade, and Shippings Boards insistently urged the mining men to produce these materials to supply the urgent needs of the nation for war purposes. When the armistice came, these mineral producers, as a result of their response to the demands of the Government, had on hand ready for delivery quantities of these materials, for which there was no peace-time market.

Congress set aside the sum of $8,500,000 to meet claims for these losses, which must be filed within three months after the passage of the act. The law states that the claims must have been incurred between April 6, 1917, when the United States went to war, and November 12, 1918, when the armistice was signed. The Secretary of the Interior is charged in the act with taking into consideration and charging to the claimant the market value of the minerals on hand November 12, 1918, and also the salvage or usable value of the machinery that was installed to produce these war minerals.

Mr. Moore is a former president of the American Institute of Mining Engineers, and a well known engineer.

Mr. Shafroth was a member of the Senate Committee on mines and mining of the Sixty-fifth Congress and Mr. Foster was chairman of the House Committee on mines and mining.

UNITED MINE WORKERS' CONVENTION.

With further reference to the recent annual convention of District 18, U.M.W. of A., one of the important questions discussed was the renewal of agreements, one of these, that between the miners and the management of the Crow's Nest Pass Coal Company, Fernie, B. C., being due to expire on the 31st of March. It was announced, in this connection, that a policy committee meeting would be held at Indianapolis on March 18th, which would be attended by representatives of all districts. It was decided, therefore, that the operators should be approached with a view to arranging for an extension of the present contract, the high cost of living commission award being paid on the wages. This was agreed upon in order that the demands of District 18 could be made to conform, in some degree, with those of the miners of the United States and possibly those of Great Britain. Representatives appointed to represent the district at this meeting are: P. M. Christopher, district president; Robert Livett, international board member; Frank Wheatley and Alex. Susnar. International Organizer David Rees also will attend. These delegates were instructed to endorse the proposals contained in a circular by Frank Farrington, president of the Illinois miners, for a six-hour day and a five-day week.

In the conference with the operators, which took place subsequently, Fuel Director W. H. Armstrong presided and the utmost good feeling prevailed. The operators agreed to postpone negotiations pending the meeting of the policy committee, and a further meeting with the operators is to be arranged as soon as possible after the return of the District 18 representatives.

Two noteworthy changes made in the constitution of District 18 Organization by the Convention were that conventions and election of officers should be held biennially instead of annually.

Preliminary Report of an Investigation into the Concentration of Graphite from some Ontario Ores

By the Staff of the Department of Mining Engineering, University of Toronto.

The beneficiation of graphite ores is recognized as one of the difficult problems of the art of ore-dressing. Unlike many minerals, graphite has no method of concentration that might be called standard; each mill has its own method, the mills between them employing nearly every known means of concentration. In addition there are a number of carefully guarded secret processes.

The difficulty in the production of graphite arises from the nature of the graphite itself, and from its mineral associations, which difficulties are complicated by exacting market standards.

Graphite occurs in two forms; crystalline and amorphous. Either form may occur as a massive variety, or as a disseminated mineral. Most of the Ontario graphite ores are of the crystalline and disseminated type, the graphite occurring as flakes varying in size from one-half inch in diameter down to dust. In Ontario are large deposits of graphite bearing rocks, yet in 1917 only about 4,000 tons of graphite was marketed, of which approximately one-third was of the best or crucible grade. This investigation was made to elucidate the principles underlying the concentration of graphite and possibly to make commercial propositions from some of the at present valueless deposits.

It is estimated that more than one-half of the graphite consumed in the world is used for the manufacture of crucibles. As graphite suitable for crucible manufacture commands a very much higher price than other grades, this investigation is limited to the production of crucible-grade graphite.

The specific gravity of naturally occurring graphite varies from 2.1 to 2.9 according to its purity, an average being 2.6; the specific gravity of the most commonly associated minerals is from 2.6 to 3, consequently complete separation of the graphite from its mineral associates by gravity methods alone is impossible.

The cleavage of graphite is so perfect that the mineral splits readily into flat scales. In wet gravity concentration methods this flakiness causes the migration of the graphite to be extremely erratic and a process depending on the flakeyness is apt to be complicated by the presence of mica or chlorite, both flaky minerals and commonly found with graphite.

Graphite is a very easily floated mineral and almost any of the systems of flotation can be used to make a good recovery. Unfortunately, mica, pyrite and calcite, common gangue minerals, are not difficult to float and these with the unavoidable middlings, are recovered more or less with the graphite.

Other processes, as electrostatic separation and chemical methods, which are used to some extent, are undesirable on account of high cost of operation or of difficulty in manipulation.

It can readily be seen from the foregoing considerations that no simple process of milling graphite is possible, that any method of procedure must consist of crushing to liberate the flake; gathering of the flake and final recleaning of the impure flake. In this operation some regrinding is almost unavoidable, and because of the large size of flake desired, coupled with the softness of the graphite, the methods employed for crushing both the original ore and the recovered concentrates become of prime importance.

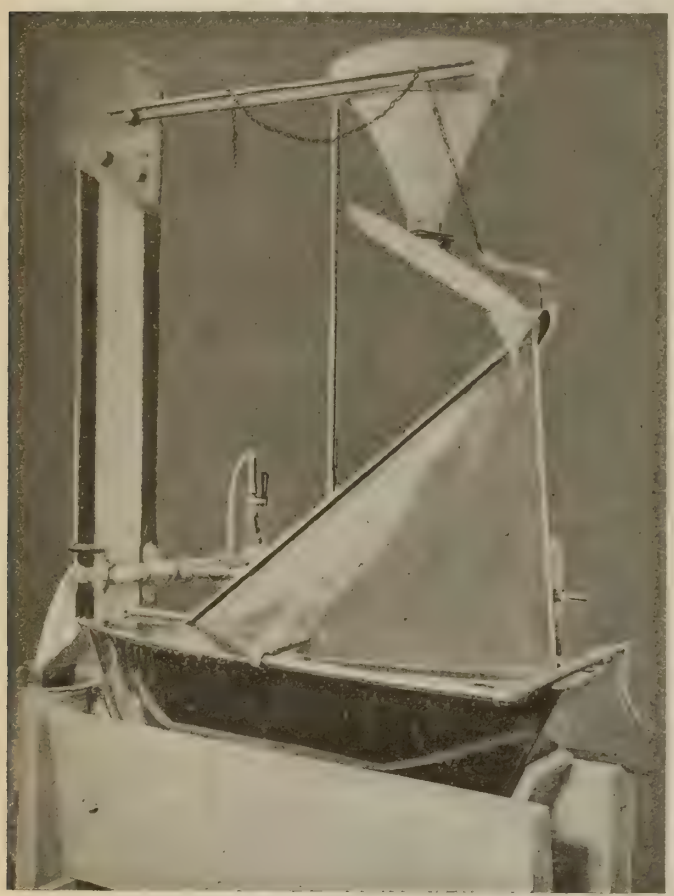
The ideal grinder for a graphite ore is one that will separate the various crystal grains with a minimum of crushing and also remove the freed graphite as rapidly as possible from the sphere of action. Such a grinder will make a granular product with a minimum of slimes. Of existing crushers, the rolls for dry crushing and the ball mill or rod mill for wet crushing deliver a product that approaches most nearly to the ideal. Wet crushing for graphite ores has some advantage over dry crushing in addition to the elimination of dust, particularly if the wet grinding is to be followed by a wet process of flotation, because graphite is soft and adhesive and in grinding tends to smear the gangue particles thereby increasing the flotable middlings. With wet grinding this tendency is negligible. With wet grinding also the flakes are washed free from dust, making possible a cleaner product. If a considerable excess of water is used in the ball mill, the flakes are washed away from the sphere of grinding action very rapidly, thereby reducing the destruction of flake to a minimum. Of course a mill run under these conditions will be inefficient considered only as a crusher, but any loss in capacity will be more than made up by the resulting increase in the saving of coarse flake.

Because of the desirability of avoiding all possible subsequent crushing, the method of concentration should aim at making a clean concentrate if possible, or one containing the smallest amount of coarse sand particles and middlings. This is of more importance even than a high extraction of the graphite from the ore, for a complete extraction is valueless if the flakes are so small as to lose their commercial value. For this reason, in choosing a method of flotation for trial in these first experiments, weight was given to the need for oil and that one was chosen which called for the least amount of flotation agent. Since all the commoner flotation processes call for oil, and as the use of oil appears to entail some gangue being floated, these methods were laid aside in favor of some form of skin flotation which may be used without frothers or oilers. Skin flotation on a dry product was considered as out of the question, the float being invariably dirty and also entailing the disadvantage of requiring the drying of a considerable tonnage of rock, whereas a wet process of flotation following the wet grinding would call for the drying of only a comparatively small quantity of graphite. Also, the disagreeable dust would be eliminated to a great degree in a continuously wet process. So the object sought was to combine a wet grinding method with a wet skin flotation process and to follow up with a wet recleaning and grading system.

The apparatus used for the experiments were laboratory machines described in the following paragraphs.

The crusher for small lots consisted of an iron pot revolving on an inclined axis. Into this pot can be placed iron balls of various sizes from 5 inches diameter down. The capacity of the mill is 2 Kilo's of ore per charge. This mill was used for grinding the ore for most of the tests and for regrinding middling and concentrate. For larger quantities a ball mill of 2 ft. 6 in. by 2 ft. inside measure was available. Another small rod mill 12 in. by 18 in. was used for some tests.

The flotation process used is a modification of the old Bradford process in which the pulp flows down an-



Concentrating Machine—Front View.

inclined plate dipping beneath a surface of water. The actual machine used is described in the Canadian Mining Journal of July 1st, 1917. Figures 10 and 11 are photos of the machine. No comparative work was done on the selection of flotation oils. The only oils used were coal oil and occasionally small proportions of rosin oil. The quantities used were so small that no greasiness was at any time noticed on the graphite. The amounts of oil varied between 2 and 16 drops per kilogram, the maximum being ¼ lb. per ton of ore.

The screens used throughout were according to Tyler's Standard Screen Scale.

The ore selected for most of the experiments was a hard granite ore found in Ontario. The bulk of the rock is a pale pink orthoclase, changing in places to microcline. Considerable biotite is present with pyroxenes, pyrite and occasionally horn blende and specks of titanite. The graphite occurs as scattered flake, ranging in size from ⅜ inch down to dust, with a few rich bands of almost solid graphite varying in thickness up to two inches.

A quantity of this ore was crushed in a gyratory crusher to pass 1 inch and further crushed to pass ⅜ inch. This was sampled and divided into lots of about 2 kilograms.

A screen analysis of one of these lots showed that the sizes coarser than 8 mesh contained practically no free flake, the 8/10 mesh a few and the 10/14 mesh and smaller sizes contained much free flake. The proportion of attached particles diminished with the decrease in the size of particles until at 65 mesh the true middlings were comparatively few.

Concentrating Machine—Side View.

Details of Some of the Tests.

For convenience of reference the tests are numbered consecutively, though only a very few of the experiments are detailed here.

Experiment No. 1.

One kilo of the ore was ground wet in two stages until all the gangue passed 10 mesh. During grinding 4 drops of coal oil were added to the pulp in the mill and the oiled pulp was then floated without extra oiling. The resulting graphite assayed 65% carbon. The tails were re-oiled with 4 more drops of oil and re-floated until the finer sands were clean, most of the remaining visible graphite being in thick pieces coarser than 14 mesh. The resulting float was very dirty, being largely made up of true middling.

Experiment No. 2.

Like No. 1 except that only one half of the amount of oil was added to the mill during grinding. The results were much the same as in the first trial.

Experiment No. 3.

The grinding was done as before, but with no oil except the traces remaining in the crusher from the

previous grindings. On flotation the first unoiled float looked clean, and assayed 79.3% as against 65.0% of the first test. These three tests showed that even small quantities of oil greatly increase the amount of gangue lifted, which, in view of the subsequent crushing, is undesirable. Therefore, all later grindings were made without any oil.

These tests had produced a quantity of material containing considerable gangue and tests were made to get an idea for a suitable treatment for such dirty concentrates.

Experiment No. 4.

The low grade oiled floats from Experiment No. 1 were reground wet without further oil until the gangue passed 65 mesh and then screened, the oversize being a clean looking flake. The undersize was refloated giving a concentrate that was not particularly clean.

Experiment No. 5.

The very dirty second float from Experiment No. 3 was re-ground and re-screened as before at 65 mesh, the oversize mixed with a quantity of tailings was refloated, resulting in a clean tailing but a dirty concentrate. This concentrate was re-ground till the gangue passed 80 mesh and then screened, giving a clean flake and a tailing from which repeated flotations failed to obtain a clean product. The assays of these combined experiments are given in table 1 and 2. These results indicated, what later trials confirmed, that re-flotation alone is not sufficient to clean a concentrate and that re-grinding followed by screening will give a clean flake.

		tailing	852	.55	
		loss	73		

Experiment No. 6.

Experiments on other ores at other times had shown that cleaner concentrates could be obtained from skin flotation by grading the material into several sizes and treating each size separately. Quality of product being the main essential in the production of graphite, trial was made of material graded by screening into four lots and each lot treated separately, viz.: The ore was crushed without oil until the gangue passed 14 mesh, the oversize was clean flake and was reserved without further treatment. The next size 14/48 mesh was oiled with coal oil and floated. The first float was clean except for a few attached particles which were liberated by a light re-grind and re-flotation: the tailing was almost pure mica. A second flotation of the sands with more coal oil and a third with a mixture of coal oil and rosin oil gave dirty floats which were re-ground and screened at 80 mesh, giving a flake and an undersize which was added to the rest of the —80 material. The size 48/80 was treated similarly. The combined undersize through 80 mesh was floated once without oil and once with oil, though no particular attempt was made to obtain a very clean product. The result of the treatment of the whole lot is given in table 3 the products being combined for assay.

TABLE 3.—(Combined results of 4 lots of Exp. 6.)

Size mesh	material used	product obtained	weight	assay % carbon	Remarks
	ore		2000	6.9	
+14		flake	5		contained no gangue.
14|48		ore	1000		most of the flake in this size.
48|80		ore	600		
—80		ore	395		includes finest slime
+48	screened	flake	83.8	91.8	+14 flake added.
48|80	ore products as above	flake	29.0	85.6	
—80		flake	12.4	74.2	
		tailings	1874	1.4	

This gives a recovery of 112 lb. per ton of ore, of graphite flake of 90% carbon and +80 mesh size. This is a larger recovery and a higher grade of flake than was obtained in tests without grading, and is almost 74% of the total graphite of the ore recovered as a high grade crucible flake.

Experiment No. 7.

The ore of this test was low grade with the same hard siliceous gangue as the ore of the previous test. Both it and the ore of the next test were considered to be of doubtful commercial value. This experiment and experiment 8 were intended as trials in the recleaning of flake. The flotation proceedure was the same as in the previous test. The result is given in table 4:

TABLE 4.

Size mesh	material used	product obtained	weight	assay % carbon	Remarks
	ore		2000	4.4

85|150		middlings	14	59.1	looked clean under the microscope.
—150		dirt	26		this was a low grade brown product largely of mica.

In experiment No. 8 the ore was like that of No. 7 except that the original graphite flakes were smaller, most of the flakes passing 28 mesh. The procedure was as before except that flotation was added as part of the recleaning process. Table 5 gives the extraction before recleaning.

TABLE 5.

Size mesh	material used	product obtained	weight	assay % carbon	Remarks
	ore		1350	4.7	
+80		flake	61	68.1	
—80		middlings	46.5	20.7	
+200		tailings	1147	.9	
—200		slime	96	2.6	not treated

The regrinding and screening through 80 mesh of this +80 mesh flake raised the assay to 80% carbon, a second regrinding brought the assay to 85%; but at the expense of heavy loss in quantity, only 35 grams remaining from the original 61. A second test was made on the ore, an effort being made to avoid the necessity of such excessive grinding. The ore was graded as before and floated, giving a +48 mesh flake and a middling. This middling was re-ground and refloated, the floats being added to the first flake, and

the concentrate was used for the recleaning test. A light regrind to crack the true middlings was followed by screening, giving a +48 mesh flake assaying 85% carbon and a 48/80 mesh flake assaying 71% carbon. An attempt was made to separate the 85% flake into two parts by flotation, one of which should be sufficiently high grade as not to require recleaning. This was not found to be possible, the difference in assay between the floats and the sinks being so small in every case as to be negligible. Regrinding the sinks and screening gave a product assaying 88.43% carbon, while similar treatment of the floats gave a product assaying 88.40% carbon. These two last when reground and screened gave a product assaying 94% carbon. This shows that regrinding is a necessary part of the recleaning and that reflotation alone is not sufficient.

Screening, particularly of fine sizes, is not a desirable process and grading can often be better performed by classification when used as a preliminary to other processes. In the case of graphite, classification would appear to have a further advantage over screening in that it might be possible to remove a large part of the purer flake from the coarser sizes of gangue to the finer sizes of gangue and thus avoid a considerable loss of flake in the grinding of the coarser portion of the gangue, which portion is the larger part of a properly ground graphite ore. In some cases it might be possible to remove a part of the gangue directly as tailing without treatment, though on the ores tried this was not possible.

Some of the advantages of classification over screening for graphite ores are shown by Experiment No. 9. A quantity of the ore as used in the first experiments was crushed in a ball mill until the gangue passed 8 mesh. This pulp was divided by a hydraulic hindered settling classifier into lots, each lot being treated by flotation, followed by regrinding and screening as the method of recleaning. The results are shown in table 6. This table shows well the increase in the amount of dirt floated with the increase in the amount of oil, also the assay of the first float is higher than anything obtained either without grading, or with screening as a means of grading. A screen analysis of some of the products shows that following grading by classification, screening alone will remove a large part of the dirt. See table 7. As shown by this experiment, H. S. classification followed by screening of some of the products is capable of giving a considerable quantity of flake that does not require regrinding; which means a saving of the larger and more valuable flake. In this particular case, by combining the first float of the 35/80 mesh lot with the clean flake obtained from screening the second and third floats of the same lot (product 8, table 6, and products 7 and 9, table 7), was obtained a flake assaying 92% carbon and in quantity approximately one-third of the total recovery expected from this ore.

The ore used in the previous tests was a siliceous ore of which the feldspar and quartz gangue minerals are not easily floated, while the previous tests show that the free biotite present did not present any difficulties with the method of treatment adopted. A test (Exp. 10) similar to the last was made on an ore of a different type, an altered limestone, the carbonates of which are much more easily floated than the silicates. It was considered that it might be more difficult to obtain a high grade flake without considerable regrinding and loss of flake. The actual work showed that the loss was not as great as expected; that while the floated graphite was not quite as high grade as that from the other ore, the greater ease with which calcite particles could be crushed made possible a large recovery of a high grade flake. The details of the extraction are given in table 9 and a summary of the recovery in table 8. The original ore assayed 14.6% carbon, the recovery of crucible flake was 232 lbs. per ton of graphite assaying 90% carbon which is a recovery of 71.7% of the total carbon present in the ore. When allowance is made for the original flake of smaller size than 80 mesh and for the inevitable losses in grinding due to the breaking up of the larger flake it will be seen that this is a very good recovery. A treatment of some lumps of the original ore with acids and subsequent screening of the flake showed that approximately 3 per cent. of the original flake was less than 80 mesh in size, which makes the recovery of possible crucible flake 74 per cent.

—80		flake	111.2	20.3	no attempt at cleaning.
		tailings	1604	2.0	slimes included.

In all the tests made, only rarely was it found possible to obtain a concentrate of graphite of such high grade that no further cleaning was necessary. Also it was found that re-flotation alone is not sufficient and that a combination of screening and flotation, while applicable sometimes, was generally useless without some regrinding of the flake.

The usual procedure in the recleaning of graphite is to grind dry between buhr stones. This method is open to the objection of being very destructive of the larger flake on account of the twisting and abrading character of the grinding action. For this reason in some mills an attempt has been made to substitute fine rolls for the buhr stones. Rolls fine enough to grip flake graphite are expensive and costly in upkeep and are not well adapted for wet crushing. A rolling action is better than a twisting one because the flakes will split and roll out flat rather than break thus liberating any enclosed mica without much reduction in the size of the flakes. Wet grinding of flake in addition to the advantages accruing to a continuously wet process has possibly a further advantage in that by dry grinding methods flakes of mica may be simply smeared with graphite and thus hidden instead of being removed. The wet grinding tests showed a possible additional advantage of wet grinding over dry grinding in the preservation of the character of the surface of the flake. This will be referred to later.

The regrinding of the flake and middlings of the previous tests was done in the small pot and ball mill described before. This mill combined the rolling action of a roll and the washing action of a considerable quantity of water, the water preventing the smearing action of the graphite and also to some extent acting as a classifier in removing the lighter flake from the grinding face, the lighter flake presumably not requiring any regrinding. The absence of smearing was well shown in one experiment, of which the details are not given, in which a clean looking coarse flake assaying about 75% and sized between 10 mesh and

80|300	ore		390.5			
		1st float	42.0	35.9	none.	no attempt made at recleaning.
		2nd float	20.0	7.1	2 drops C.O.	
		tailing	428.5	.53		
—300	slimes		53.5	4.9		not treated.

48 mesh was reground and refloated. The resulting graphite flake assayed over 90% while the tailing was pure mica, the separation being very clean and distinct. The absence of the smearing action on the reground material means that it is possible to return such a product into the general circuit of the mill without the dirt being refloated by the graphite smears and reappearing in the concentrate.

The small pot and ball mill is suitable for only small quantities. Trial was made of a larger mill built more after the style of commercial machines. This mill is a small tube mill 12 inches diameter and 18 inches long with continuous feed and central discharge. In operation it was charged with about 50¼ inch diameter steel rods. This weight of rods is only a small part of a full charge of rods for the mill; but it was found quite sufficient as selective grinding is desired, only the heavier flakes and the coarser middlings requiring treatment. To aid the selective action a considerable excess of water was used. This mill used intermittently did the regrinding of the products of table 9. The results were considered satisfactory both as to the effectiveness of grinding and the preservation of the character of the flake.

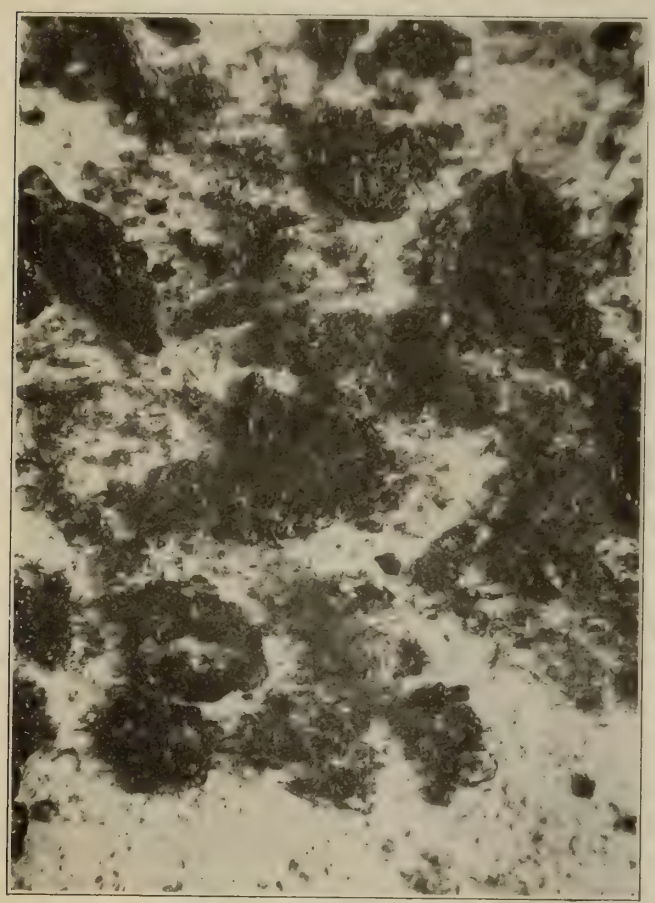

Fig. 1.—Graphite before burning Flake from product No. 2, Table 6.

A quantity of dirty graphite and middlings had accumulated from the previous work and this was made use of to get an idea as to the operation of the mill used continuously. The middlings were first run through the mill and then screened at 100 mesh, the undersize was brown and contained only a small part of the graphite and assayed between 4% and 5% carbon. The oversize was added to a lot of flake and this reground in the mill. The mill was started with water only and then the flake fed in at a rate of 50 lb. per hour. The mill was stopped one minute after the last of the graphite was in and the mill emptied. The results showed that the capacity of the mill on such a graphite material is large and the grinding efficient, even with as small a rod load as was used. In this particular instance the raising of the assay of the +80 mesh graphite from 79.5% to 95% carbon shows that the mill was operated much under capacity and the graphite consequently much over-ground, resulting in an unneeessary destruction of flake. Owing to an accident the complete returns cannot be given, but table 10 gives a summary of the results of the last regrinding.

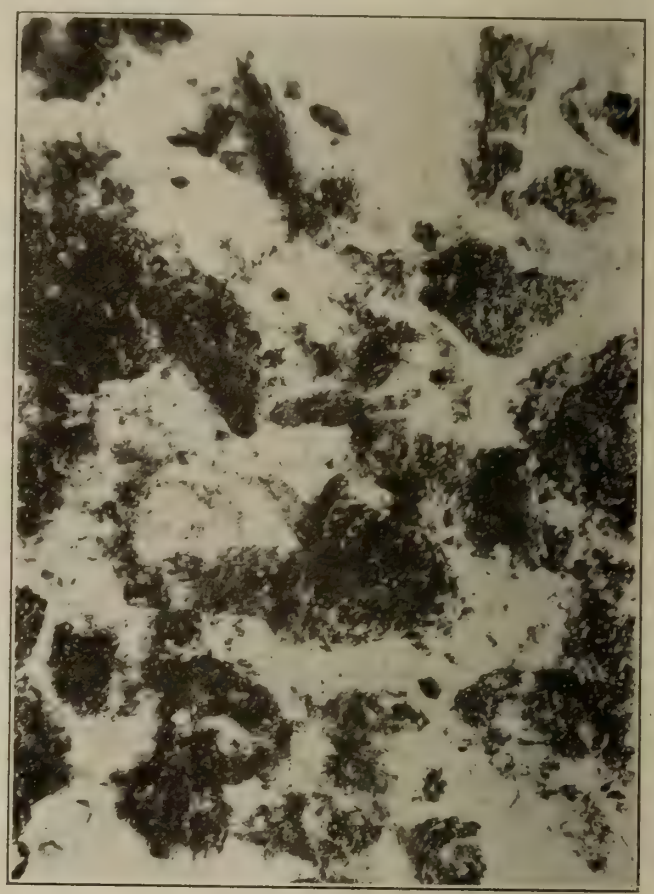

Fig. 2.—Mica remaining after the burning.

Confirmatory evidence of the impossibility of avoiding regrinding, apart from the regrinding of gangue which may be visible as middlings, is given by physical examination of some of the flake. Repeatedly in making these tests graphite products were obtained that to the eye and to the feel of the fingers were clean and in some cases the microscope failed to show the presence of any dirt, and yet the assays were often disappointingly low. This invisible dirt consists of some minute particles of quartz, etc., embedded in the

Fig. 3.—A raw unground flake.

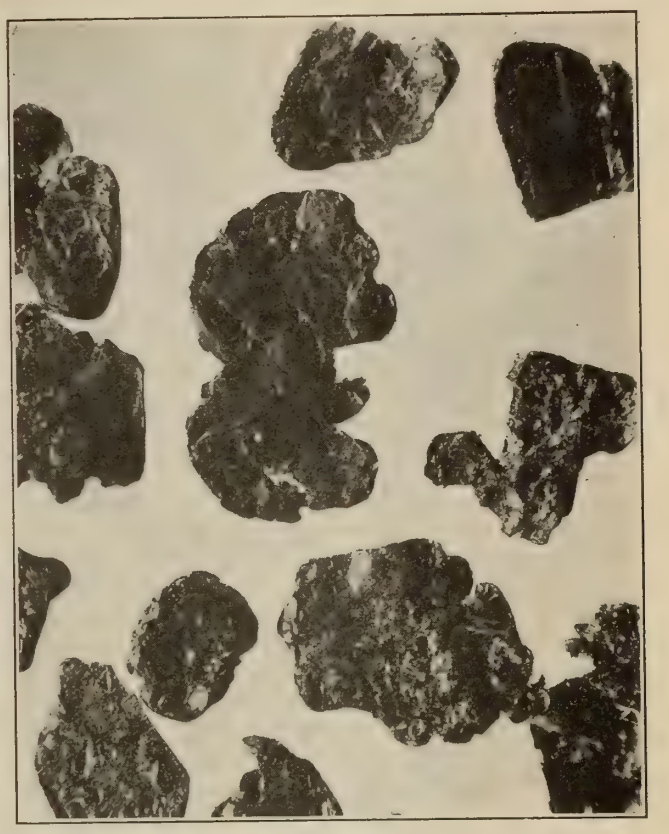

Fig. 5.—Wet ground flake. (Compare with Fig. 4.)

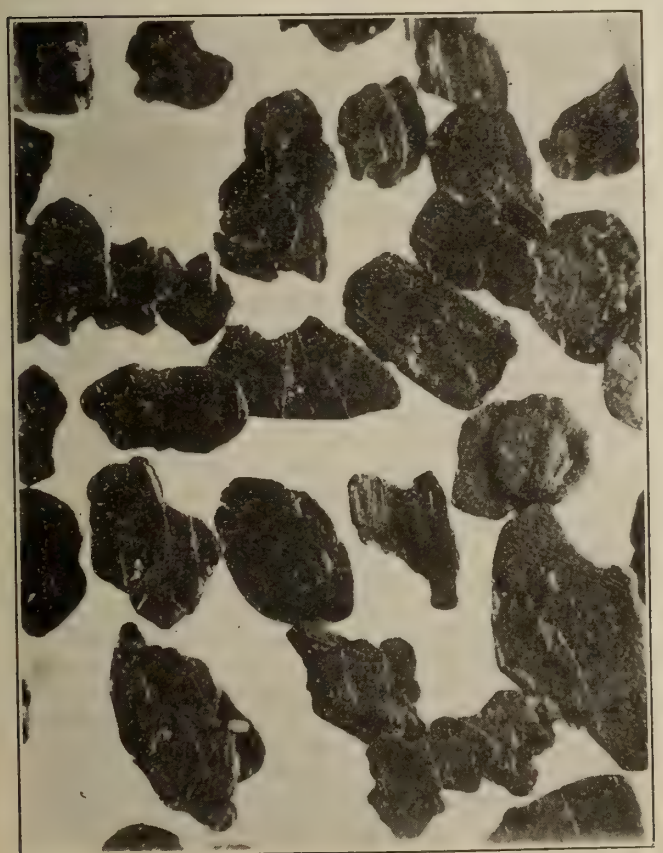

Fig. 4.—Crucible grade graphite. Dry ground. (Note rounded edges.)

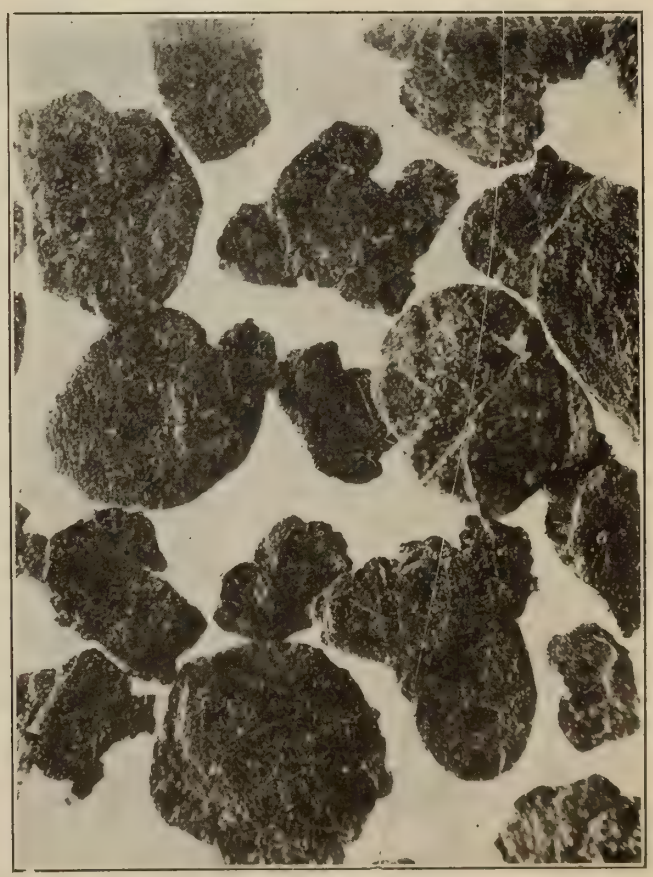

Fig. 6.—Wet ground flake that has been given a slight regrind.

flake and some iron compounds, very often as oxide, distributed throughout the flake, but by far the larger part of the dirt consists of flakes of mica sandwiched between flakes of graphite. The iron rusts are not usually in sufficient quantity to be of great importance provided the mica can be efficiently removed. The distributed dirt can only be removed by chemical means while these tests show that the mica can be comparatively easily removed by proper means of regrinding. The intimate relationship of the mica and the graphite is well shown by figures 1 and 2. Figure 1 is a flake from product No. 2, table 6. This was hand picked to be 100% pure to the eye aided by a glass. It was placed on an alundum plate and burned. Figure 2 is a photo of the remaining mica after combustion for 35 minutes in an atmosphere of oxygen. In each case the mottled background is the alundum plate on which the flake was placed for burning.

American crucible manufacturers, for the manufacture of their graphite crucibles, prefer a form of graphite imported from Ceylon rather than the flaky product of American origin. Of the graphite they use only about 20% is of domestic origin, the remainder being imported. This preference is partly due to the at one time unreliability of the domestic grades and production; but the manufacturers also state that Ceylon graphite makes a better crucible than the domestic flake of the same grade and chemical composition. This difference must then be due to the physical character of the flake, probably to the thickness of the flake and to the nature of its surface. With many graphites the thickness of the flake, and with all graphites the character of the surface, depends on the

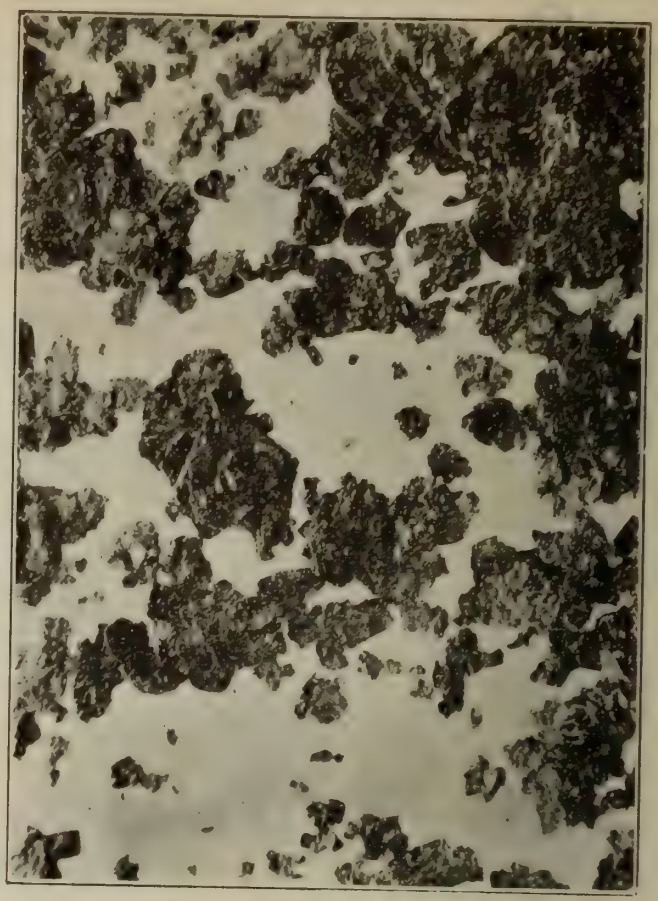

Fig. 8.—Wet ground flake of Table 10.

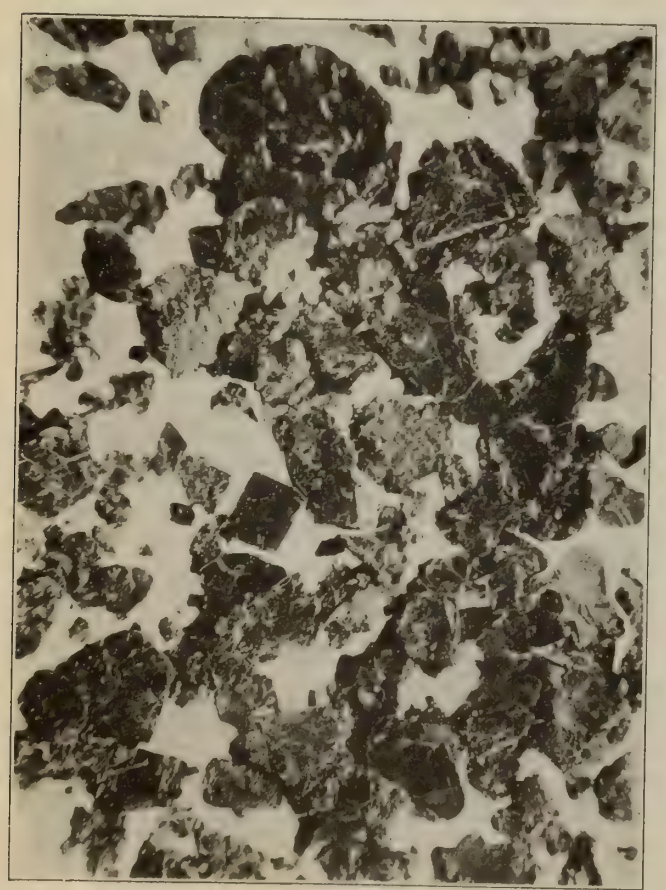

Fig. 7.—Wet ground flake of Table 1. (Square fragment of orthoclase in centre.)

nature of the regrinding process during cleaning. Naturally by reducing the regrinding to a minimum the original thickness of the flake will be best preserved; but the nature of the regrinding by preserving or destroying the natural surface structures of the flake may have a most important effect on the future use of domestic flake. Next to the refractory qualities of a crucible is its strength and toughness, and, given the right kind of clay as the bonding agent, the strength will depend on the bond between the clay and the graphite, which bond will be best if the naturally occurring roughnesses of the flake are preserved. Graphite is crystalline and the crystalline character expresses itself on the surface of the flake in a variety of cleavage lines and facets, resulting in a distinctly rough surface which is the ideal surface for bonding purposes. Figure 3 is a photo of a raw unground flake and shows the irregularities on the natural surface. Ceylon graphite, which requires little grinding before use, retains these irregularities and thus makes a good bond with the clay. By the common method of grinding graphite between buhr stones the roughnesses are largely smoothed away, resulting in an inferior bonding property and therefore an inferior crucible. Figure 4 is a photo from one of the graphites on the market, note the smoothed faces and rounded edges. Compare this with figure 5, a photo of some of the wet ground flake taken from the ball mill. Figure 6 is of a similar flake given a light regrind in a rotary laboratory grinder. Figure 7 is of the wet ground flake of table 1. Figure 8 is of some of the wet ground flake assaying 95% carbon of table 10. Even excessive regrinding in a wet rod mill does not destroy the surface structures as is shown by the graphite of table 8 (figure 9) of which 43% of the

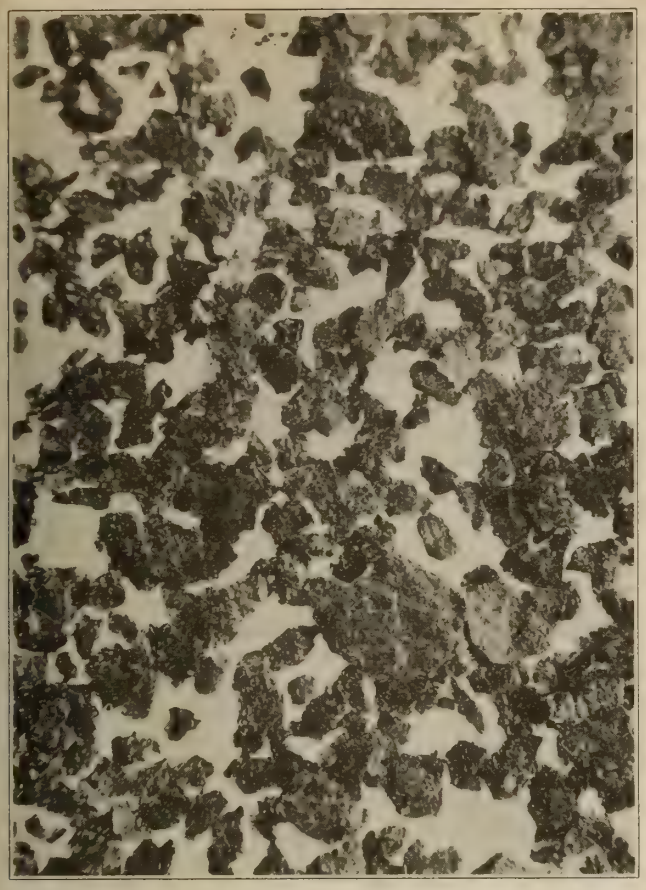

Fig. 9.—Excessively reground. Raised from 67% to 88%

flake was ground away in raising the assay from 68% to 85% carbon. Inspection of these figures shows clearly the differences in surface structure due to different grinding operations.

In these tests skin flotation was used because of its convenience and ease of manipulation, but the essentials of the system of treatment based on the results obtained will apply also to other systems employing other processes of flotation.

Proposed System.

From the results of the experiments a system of concentration for graphite ores may be outlined. The details are subject to variation and arrangement to suit the peculiarities of various ores; but in a general way the scheme is as follows:

1. Crush wet in a rod mill or a ball mill, using an excess of water and the minimum of crushing compatible with the liberation of the maximum of coarse flake.
2. Remove the large flake from the mill oversize by screening. With the smaller-flake ores this is not advisable.
3. Divide the sands by hindered-settling classification into several grades.
4. Float each grade separately and by stages, regulating the quantity of oil to the requirements of each stage, making concentrates middlings and waste.
5. Regrind the concentrates and the middlings separately in a rod mill with excess of water.
6. Screen wet, making a high grade flake and a dirty undersize to be returned for flotation.

This system offers some decided advantages over the older processes. The whole process is wet, eliminating the dust nuisance and avoiding the necessity of drying large tonnages of rock, saving the cost of heat and the handling required in the drying operation. The only drying that will remain to be done will be of the small proportion of finished graphite.

The minimum destruction of flake due to its rapid removal and the minimum of crushing required combine to produce a maximum of coarse flake from this method of crushing. The absence of smearing helps to keep the production of floatable middling at the lowest point.

Separation into grades, while not absolutely necessary, is an advantage in that it renders possible the flotation of some high-carbon flake that may not require re-grinding at all, and also because the sizing of the material helps the separation of graphite and mica in the subsequent flotation process, where the elimination of free mica is practically complete. Flotation by stages permits the adjustment of the amount of oil added, so that after the cleaner graphite is removed almost any desired amount of middlings may be obtained, leaving to be discharged as waste by far the largest portion of the ore as a coarse sand.

Perhaps the most striking difference between this system and the older systems is in the character of the final product due to the substitution of wet grinding for dry grinding, not only in the original crushing, but in the cleaning operation on the recovered graphite. Not only does the wet grinding, as proposed, split the flake, liberating the mica clean and in good condition for separation, and also doing some selective grinding as between graphite and dirt, but it does this work on the flake without destroying the original surface characteristics of the graphite flakes and so preserves its bonding qualities. The graphite flake produced by wet grinding in connection with wet screening is very different in appearance from the dry ground flake. The flake is thicker, it has a large proportion of the coarser sizes of flakes, and is more brilliant in appearance than dry ground flake because of its crystalline faces and the more efficient removal of the fine dirt by the wet screening. Graphite produced by this system should prove to be the equal or the superior of any flake at present produced.

The process as outlined is simple and does not call for an elaborate flow sheet. Any seeming complication due to flotation by stages is more apparent than real, and would be more than offset by the added recovery of only a few pounds of the high grade flake from each ton of ore.

PERSONALS.

Mr. Geo. C. Mackenzie has resigned his position in the Mines Branch, Ottawa, and will be general manager of Electric Steel and Engineering Co., Welland. He took up his new duties on March 14th. Mr. Mackenzie did splendid work for the Mines Branch.

Mr. A. F. Coyne, president and managing director of Northern Production Co., Ltd., and Mr. G. L. Stebbing, are in Toronto on their way to England.

Mr. E. J. Carlyle, brother of W. A. Carlyle, is now with the British America Nickel Corporation. He is located at Murray Mine.

Dr. E. L. Bruce, of the staff of the Geological Survey, is giving a course of lectures at the University of Manitoba during the second term.

-:- A Trip to Newfoundland -:-

By J. C. GWILLIM.

Newfoundland is, to most of us, a little known Crown colony and island, for few visit the island although we travel great distances in our own Dominion. My own acquaintance of this island does not entitle me to write a book upon it, for a week's travel began and ended it; but that week was full of interest and impressions, and technical readers may sometimes tolerate a "journey of observation," as Mr. T. A. Rickard calls it.

During the war many more or less obscure minerals were being sought for by the Imperial and Canadian Munition Boards. Many were the patriots who bombarded them with disclosures of the occurence of needed ores. In one case, Lloyd George, then Minister of Munitions, was besought to open up a molybdenite deposit, which the correspondent, a station agent in British Columbia had heard was most promising, and knew no more about it. An insistent owner of antimony bearing lands in Newfoundland importuned the authorities to examine the ground and to settle the matter some one had to make the trip. Many costly trips of this sort are made at the behest of people with more authority than wisdom.

So it came to pass that I was on my way to Moreton Harbor, Notre Dame Bay, on the east coast of Newfoundland in May, 1916. The Canadian Department of Mines could provide one with no maps, reports or other information, for it was outside its territory. A few stories of hunting trips, and a recent write up in the Journal of Commerce with a map on a small scale were all I could get before leaving. Arrived at St. John, I betook myself to the museum and geological office, but found no one there except one lady, who gave me some bulletins concerning the mineral occurrences, as scanty as used to be the Annual Reports of the Minister of Mines for Quebec. Also, to my joy, a geological map of the country made by Dr. Howley. Dr. Howley himself, after fifty years of traversing this wilderness was now unable to come to his office, so I went to see him at his home.

Here I found him, at this time, more interested in the recent publication of his life work upon the Beothuks or Red men; aborigines of the island, a race which became extinct within his own experience. I bought the book and read it later, after I had seen something of the country. The narrative is, like its setting, one which conveys a feeling of the aboriginal and prehistoric, of a distinct race which, friendly at first to the coasting fishermen, withdrew to the interior and died out like some shy and untameable animal, forever driven from the coast by relentless cruelties.

Fortified with the geological map, some local advice, and a letter of introduction to a resident of Moreton Harbor I took the Reid-Newfoundland train for Lewisport, on Notre Dame Bay. One does not go far from the coast before entering primitive Newfoundland. It is a matter of wonder that a railway should be built through such unpromising natural resources—at this time a leafless land just free of the winter snow. Coming down the Lewisport junction line through such a landscape we chased a very thin horse which had survived the winter. He tried to beat the train into Lewisport; but at a low trestle got his legs embarrassed in its timbers. We got him out and left him, not much the worse for it, regarding us from the willow brush flat which adjoins the village of Lewisport.

From this place there was a boat service to Moreton Harbor, forty miles away on an island. Thence we went to Twillingate, the "Northern Capital." As we proceeded out into Notre Dame Bay, with its many islands the wind grew chilly and there was talk of drift ice coming in.. Two of the passengers who, at first, I took to be American evangelists, turned out to be photograph enlargers. They said business was good at fifteen dollars a photo in these secluded fishing villages around the coast. They were bound for Moreton Harbor. As evening approached we sighted a few lordly icebergs, and cut through a little drift ice. The captain said he might not be able to call in at the Harbor on his return, if the ice came in. He was due to return in two days, but his boat got fast near Twillingate and I never saw it again.

Moreton Harbor is, I suppose, one of dozens of little fishing village tucked in the bottom of a good sized cove, with rocks and wilderness as a backyard. The two apparent evangelists and myself excited a temporary interest as we landed at the wharf, but the inhabitants soon drifted off to their home fires and supper. We lugged our baggage up to a Mrs. Turner's house, where strangers were sometimes taken in; but Mrs. Turner could do nothing for us. So we sat on our provisions by the wayside and held a council. The evangelists would scour the village for beds, and I would present my introduction to a local storekeeper. The storekeeper had a good sized house; but madame was at her spring cleaning, and though I protested my readiness to sleep anywhere could not allow her household goods to be seen in disarray. Thence I was taken round the bay to an ancient mariners abode. He had no room. We drifted back to Mrs. Turner's and found that after all my persuasive friends had got a lodging there, and another one for me further round the harbor. Thither I went in the darkness and found the family not yet retired.

After toasting myself at a hot stove I was escorted to an upper bedroom as cold and cheerless as an Arctic case. The Newfoundlanders are a hardy people. They seemed to be quite warm in their house clothes, at any time, whereas I had on the usual attire plus a suit of pyjamas inside and a sweater and overcoat outside.

Next morning the harbor was filling with drift ice from the Labrador coast, driven in by a cruel northeast wind. The ancient mariner of the night before was my guide over the antimony property. It was a low upland covered with bog, rock and scrubby conifers. The hand of man had not yet despoiled this ground of much antimony ore, but a well defined and once worked vein on an adjoining claim would, if produced far enough, not miss the tract under examination—for it was extensive.

The ancient mariner took great interest in the ice pack coming in. He said that last year it did not go

out of the harbor until June 21st. It was now about May 20th, and I began to look for some other way back to the mainland, for a month in Moncton Harbor seemed excessive for the opportunities offered. There was a trail or road of several miles to a narrow strait, thence to the mainland and Lewisport. While I was contemplating this, I found a good road to a more sheltered harbor in the lee of the island. Here I asked a fisherman if he could go to Lewisport next day. He thought so, but it would cost me a lot. It would cost me five dollars. "I'll give you ten," I said with much relief.

Next morning we were off in a good sized gasoline fishing boat, such as is used in "The Labrador." We dodged ice cakes and seals and arrived at Lewisport before noon. This was not much of a place to stay, though cheap enough, and I went on a local train up to Grand Falls to await the express which passed next day for Port au Basque. The station at Grand Falls is a modest affair and a shack or two near-by was all I could see. So when a man came up to me on the blind side of the train and said: "Cab, sir?" I replied in astonishment, "Where is the town." "About two miles," he said.

Between the station and the town the aspect of the country changes. One descends a little towards the river through a sprightly growth of trees. There is soil, real red earth, and some small ploughed fields. A softer, more benign landscape than elsewhere, is due to a geological factor, for there is here a basin of red sandstone, which, breaking down has left a mantle of soil rich in iron. I viewed the falls, a pretty picture in the evening sunlight, with sea-gulls flitting over them, also the great pulp and paper mills of Lord Northcliffe and the orderly little town built on a raised flat, with promise of gardens later on.

Next day the Reid-Newfoundland express took us onwards and upwards through the small scrub, bog and rock to a barren desolation which looked like the roof of the world. A weird landscape of granite boulders, with here and there a mass of glaciated rock like some leviathan watching for sunrise. Here the reinder and paleolithic man might well feel at home, or the extinct Beethuk find a refuge. It is 1,200 feet above sea. We left this drear spot by a little coulee which soon became a ravine and a valley. Toward evening we sped downwards to an arm of the sea.

On the train were some companies of the voyage from Halifax to St. John, and the Premier of Newfoundland, now Lord Morris. We whiled away the evening listening to stories of the supernatural, of which he said he now had about a hundred dealing with the wild coast and its fishermen. It is to be expected that these lonely hamlets would harbor ghosts as long as any place on the earth. I trust his life will give him leisure to make a book of curious stories. We reached Port au Basque in early foggy morning and left the treeless shore of Newfoundland for North Sydney and the green hills of Nova Scotia.

Diamond Drilling Property at Boston Creek.

Diamond drilling apparatus is being set up on the Cullen-Renaud property in Boston Creek district preparatory to the exploration of the big vein at depth. The first hole will be driven at an angle which should cut the main vein at a depth of about 400-feet. The Cullen-Renaud is a portion of the holdings of the Allied Gold Mines, Limited.

Market Conditions

In the market for mineral raw materials, a general dullness continues. Many important producing districts in the United States have curtailed operations by as much as 50 per cent. The explanation of the situation is found in the fact that large stocks were accumulated before the signing of the armistice, and have not yet been absorbed. The consumers are largely keeping out of the market until it becomes apparent that some stable level of prices has been reached, and until the extent of the post-war demand becomes evident. This situation is further aggravated by the present shortage in ships and the resulting uncertainty as to when foreign imports may be resumed on a large scale.

After investigations by the U. S. Bureau of Mines the following information was recently given out:

Iron Outlook Promising.

The outlook, although the market is still dull, is promising; the demand for iron and steel should soon begin to be felt to supply the needs of construction neglected during the war. A good example of this condition is India. Before the war India was importing almost twice as much iron and steel products as at the close of the war, and the source of a large part of the supply shifted from England to the United States. India, therefore, is short in iron and steel supplies, as compared to the normal consumption, by several hundred thousand tons.

Some demands for iron and steel products come from China and also South America during February. The activity in China is of special interest as indicating development in that country.

The chief item of interest during February was the formation of the London Iron and Steel Exchange, which is an organization to promote the interests of the British iron and steel manufacturers and producers. It is apparently the outcome of the recommenations of the departmental committee appointed by the London Board of Trade, and will be similar to the organizations in Italy, Russia, and other countries.

Copper Prices Down Before Other Prices.

Business in major electrolytic copper markets for February is reported as ranging between 18½ cents at the beginning, and 16 cents towards the end of the month. Sales from minor interests have probably been somewhat under these figures. Figures for total sales are not available at this time, but it is apparent that sales have been made at the expense of prices.

From 1904 to 1913 the average price of copper was 15 cents. At no time since 1898 has the average annual price of the metal fallen below 12 cents.

Were the prices of food stuffs, necessities of life, steel products, manufactured articles, and other inflated commodities to approach as near normal as current quotations of copper, industrial activity and expansion would probably prevail. The establishment of a Government price-adjustment board is expected to accelerate the return of industry to a normal basis.

Lead is Cheap.

The domestic market for lead has been very dull during January and February. During the week of February 13 to 19, the St. Louis price varied from 4.60 to 4.75 cents per pound, as compared with an average price in 1918 of 7.222 cents, and in January, 1919, of 5.316 cents.

It is to be noted that following the abandonment of a fixed Government price for lead the London quotation rose from 29 pounds to 40 pounds as the average for December. During January there was a recession owing to accumulating stocks, and on February 19 the price was apparently stable at 25 pounds.

Galvanizers Still Using But Little Zinc.

The domestic market for zinc has been very dull during January and February. During the week of February 13 to 19 the St. Louis price varied from 6.20 to 6.35 cents, as compared with an average price of 7.890 cents in 1918 and 6.922 cents in January, 1919.

Small consumption by galvanizers has been a feature for more than two years, and accounts for the decreased domestic production of secondary spelter. Galvanizers are buying to some extent at low points in the market.

In London, the removal of the fixed government price was followed by a rise from £54 to £56.050. Notwithstanding increasing government stocks this price held during January, but had fallen by the 19th of February to £45.

Chromite.

Little interest is exhibited in either the production or purchase of chromite. Considerable speculation is indulged in regarding the ability of either American or Canadian purchasers to compete with such foreign fields as New Caledonia and Brazil. No market quotations on chrome ore nor ferrochrome are available.

While domestic production of chrome ore is practically at a standstill, and there is no market for the ores except for those shipping on old contracts, yet the imports are of fair size and are increasing.

Pyrite.

There was no marked activity in the pyrite and sulphur industries during February, owing primarily to some curtailment in acid manufacture, and to the slowing up of other industries utilizing these materials.

The termination of hostilities found the large consumers of pyrite and sulphur with considerable reserves of raw material and finished product on hand. Until these reserves are absorbed and markets and prices are adjusted to a peace-time basis, the demand for both pyrite and sulphur is likely to remain uncertain.

Some individuals in intimate touch with the industry think that sulphur will come into active competition with pyrite. Others, however, take the view that the sulphur producers will not cut the price of sulphur to any extent in order to compete with pyrite. They believe that the sulphur producers may compete to some extent in some of the more favored localities in the South, but will not bid for the business along the North Atlantic coast.

Advice from some of the larger consumers, such as the General Chemical Co., is to the effect that they are not at present in the market for either pyrite or sulphur owing to large stocks. One of the largest consumers of pyrite and sulphur operating its own mines has sufficient stocks on hand for a considerable period, at its midwestern works, and expects that its seaboard works can be supplied, as formerly, by Spanish ores.

The Canadian pyrite industry is not active. The present shipments into the United States are from the Eustis and Weedon mines in Quebec, and the General Chemical Company's mine at Sulphide, Ontario, at the rate of approximately 6,000 tons per month, or 75,000 tons per annum.

One of the General Chemical Company's mines in western Ontario, is not shipping, and is not likely to resume operations for at least a year.

Sulphuric Acid.

Information furnished by a representative of the Chemical Alliance indicates that there has been considerable curtailment of production since the first of the year, also some falling off in price. Acid of 66°B. is now being offered at about $20 per ton in the Eastern markets, and by-product acid, 50° B, from the zinc plants, is being offered as low as $10 per ton in the Chicago markets.

The acid manufacturers kept their plants running at nearly full capacity until the first of the year, in order to keep labor employed, although in the latter part of the year the demand for acid for war purposes had practically ceased. Thus the large reserve stocks already on hand were increased. Besides, at the termination of the war, there were in transit and in storage large stocks of acid at the various explosive works.

The outlook for a large demand for acid in the steel and oil industries is exceptionally good.

Magnesite.

The magnesite industry continues in much the same condition as in January and late in 1918. Some of the consuming companies are taking advantage of the quiet condition to make necessary repairs, or changes, at their plants.

One of the most important factors in the success of Austrian magnesite has been the careful standardization of the finished product, attained only by careful selection and preparation of the raw material, and skillful burning, whereby a product of uniform quality has been assured. Uniformity and close adherence to specifications undoubtedly have been important factors in the growth of both Austrian and Grecian business in the United States.

Gypsum.

Gypsum production is largely influenced by activity in the building industries. The large decline in use in 1918 was caused both by lack of demand on account of stagnation of building industries and by restriction of shipping due to high freight rates, scarcity of bottoms, and war regulations.

Increased activity in the gypsum industry for 1919 is presaged by the incorporation of several new mining companies, the building of new mills, and the reopening of old mines. The Gypsum Industries Association, of Chicago, Ill., has launched a campaign to popularize greater use of ground gypsum on the farm both as land plaster and as a deodorizer and a fixitive of ammonia in manure about stables.

Special Correspondence

NORTHERN ONTARIO.

Prospectors Review Licenses.

Renewal of mining licenses, which are the fundamental basis on which all mining claims are staked and held in the North Country, is in full swing. The time for renewal expires on or before April 1st. Officials at the various offices throughout the North state increased activity among the prospectors is apparent this year, presaging greater activity in the prospecting game during the coming spring and summer.

Sinking Central Shaft at Miller-Independence.

The enlargement of operations announced some weeks ago for the Miller-Independence Mines, Limited, of Boston Creek is now under way, and the central shaft has been commenced. This working is being prosecuted by the use of two plugger drills, and rapid headway is expected. The shaft will be sunk to a depth of 600-feet. It is expected the main vein of the property will cut across the working before this depth is reached. A station is to be cut at the 300-foot level and a crosscut driven to the vein at this point. No time will be lost, however, in sinking. Once the station has been made at the 300-foot level, extra machines will be put on for the purpose of crosscutting.

In the meantime drifting operations will be continued on the orebody in the 200-ft. incline shaft, where calaverite was first discovered on the Independence, and the importance of the rich orebody made known. The work now in progress in this portion of the mine will permit of blocking out a large tonnage of high grade ore for early treatment in the mill, and it is anticipated stoping operations will soon be under way. Thus, by the time the central shaft has reached the proposed depth of 600-feet the mine will be on a producing basis down to the 200-foot level.

The connecting of the subsequent levels of the mine will probably be accomplished by raising on the orebody from the 600-foot level, thus facilitating the work, and gaining time in the development of the property.

A second large vein discovered has a dip which should cause it to cut the new central shaft at a depth of about 280-feet. Very little surface work has been done on this vein, but it has been proven to contain gold tellurides. The development of this vein at the point where expected in the new shaft will give added interest to the progress of the work at the Miller-Independence. The management are making plans for the installation of electric power to replace the present steam plant, and this will facilitate the development of the mine to a very great degree.

Right of Way Mines.

The annual general meeting of the shareholders of the Right of Way Mines, Limited, of Cobalt, will be held at the head office, Ottawa, on March 24th, for the purpose of receiving the annual report for the past year, the election of officers for the ensuing year, and for the consideration and if deemed advisable, ratifying and confirming by-law No. 49, passed by the directors authorizing the sale of the company's unissued shares at a discount of 97 per cent. below par and for the transaction of such other business as may properly be brought before the meeting.

Nipissing Dividends.

The dividend of 5 per cent., declared by the Nipissing Mining company, payable April 21st, to shareholders of record March 31st, will call for a disbursement of $300,000. This will make a total of 15 per cent., or $900,000 already distributed this year. The total disbursements of the company since 1906 have now reached the huge figure of $18,840,000, while the total production of silver from the big mine is in the neighborhood of 52,000,000 ounces.

Kerr Lake.

During the month of February the Kerr Lake Mining company produced an average of approximately $3,400 every twenty-four hours. Therefore, although production shows a decline during the past few months, the mines' output is still maintained at upwards of a million ounces of silver annually. The production at this property at present is on a basis similar to that of the Coniagas and O'Brien properties. The financial position of the company is exceptionally strong.

Mining Corporation.

During the year 1918 the Mining Corporation of Canada shipped 1,994,061 ounces of silver. This significant fact is no doubt responsible for the latest dividend announced by the company being unaccompanied by the usual bonus, which had become almost as regular as the dividend disbursement itself. For the year 1917 the company was the heaviest silver producer in the Cobalt camp. During 1918, however, both the Nipissing and Kerr Lake production exceeded that of the Mining Corporation.

Operating the Old Foster Mine.

The continued operation of the old Foster property at Cobalt, under lease is said to be attended with very gratifying results, some very good ore is being bagged. A considerable tonnage of Cobalt ore is being mined from the second level. The water is being pumped from the lower workings of the mine preparatory to carrying on further exploration work, while a substantial tonnage of mill rock is being developed at the first level.

Ore Shipments.

Ore shipments over the T. & N. O. railway during the month of February amounted to 1,186.93 tons of silver ore from Cobalt and 88.50 tons of nickel ore from the Alexo Mines at Porquis Junction. Silver ore shipments from the respective mines were as follows:

Mine.	Tons.
Buffalo	220.00
Coniagas	218.52
Dominion Reduction	95.25
Hudson Bay	30.77
Kerr Lake	73.90
Larose	73.66
McKinley-Darragh	239.26
O'Brien	96.00
Penn-Canadian	52.20
Trethewey	40.55
South Lorrain:	
Pittsburg-Lorrain	46.82
Total	1,186.93

Murray-Mowgridge.

Satisfactory arrangements are said to have been completed for the financing of the Murray-Mowgridge property at Wolfe Lake, near Bourkes' Siding on the T. & N. O. Ry. Supplies are being taken in to the property and active operations are expected to be under way early in April. A small mining plant has been installed on the property and the vein on the surface has been stripped for a considerable distance, while the shaft has been sung to about one hundred feet with a small amount of lateral work accompanying. The results of the limited amount of work so far done on the property have been decidedly encouraging.

Matachewan Gold Mines.

Due to friction between the principals involved in the leading mining property of the Fort Matachewan Mining Field (the Matachewan Gold Mine) the district is losing the benefits which might be derived from the active exploration and development of the property. It was expected the winter roads would be used for the transportation of supplies to this property and that active operations would be resumed early this spring, but such has not been the case. While it is generally admitted that the district has a good deal of merit, the failure of the Fort Matachewan Gold Mines to proceed with development work naturally has a restraining influence on would-be purchasers of mining properties in the district. It is nevertheless the opinion of not a few mining men that Fort Matachewan will ultimately receive due attention with excellent possibilities of developing satisfactorily.

Adanac.

Continued favorable results are being met with in the development of the Adanac Mine at the 310-ft. level. Last week ore was broken into when a winze was started which was of exceedingly high grade, the vein having a width of from ten to twelve inches. Considerable high grade ore is being bagged and the outlook is very favorable.

Will Build Railway to Kirkland Lake.

The recent announcement that the Ontario Government will build a branch line of the T. & N. O. railway into Kirkland lake from Swastika, is one of the most important announcements ever made in connection with the development of the Kirkland Lake Gold area. The decision has been reached after careful investigation of the conditions existing at the various properties in the camp, and puts a stamp of approval on the merits of the camp and presages a great future for the district. The steady grow and development of this camp has gone on in spite of the rigors of war. The past two years has been marked by very rapid development of the camp from the initial stages to that of a thriving modern mining town. With the completion of the transmission line of the Northern Ontario Light and Power Company's line from Cobalt, bringing abundance of electrical energy for the operation of the many mining plants and lighting of the mines, the need for better transportation facilities led to the construction of a truck road from the railway to the camp, coupled with telephone connection with the outside world. All this time construction was proceeding on mining and milling plants, until to-day five mills have been completed and a sixth is under way. Now, it has been officially announced the camp is to have a railway. Much speculation is rife as to which route will be chosen for the railway. Some favor the route around the south end of the lake, thus passing in close proximity to the leading mines, while others are in favor of the railway crossing Kirkland Lake at the narrows to the north. It is officially stated the latter route has a lighter grade than the former. The cost of operation at the various mines should show a substantial reduction with the completion of the railway and the abolition of the present necessary expenses of hauling supplies.

Hunton-Kirkland.

Recent developments in the Hunton-Kirkland deal are understood to have been disappointing. Difficulties appear to have arisen which, while possibly not insurmountable, have altered the trend of the company's affairs and tend to surround the deal with much uncertainty.

Work Resumed at Minaker-Kirkland.

Work has been resumed at the Minaker-Kirkland property at Kirkland Lake. The Minaker lies adjacent to the Lake Shore Mines on the south. A number of well mineralized veins have been opened up on the surface of the property and a shaft has been started on the most promising of these veins, where it passes onto the Minaker from the Lake Shore. The necessary mining equipment for the preliminary development of the property has already been installed, and thus another active operation is added to the long list of Kirkland Lake Mines. Mr. John W. Morrison, formerly manager of the Lake Shore Mines is in charge of operations at the Minaker.

Tough-Oakes Resumes.

The Tough-Oakes Gold Mines at Kirkland Lake this week resumed operations. This pioneer gold mine of the Kirkland Lake camp is now apparently free from the retarding influence of serious litigation, and appears destined to soon resume its place among the leading gold producing mines of the Dominion. Although mining operations were resumed this week, it is not expected the mill will be placed in operations for some time yet, possibly not until early in June. During the most prosperous period of its career the Tough-Oakes mine produced gold at the rate of about $60,000 per month, and ranked among the first five gold mines of the Dominion. Its operation is now under control of the new interests with Harry Oakes as President and C. A. Richardson manager. Col. H. H. Johnson, representing the Kirkland Lake Proprietary is here from England, and while official announcement is lacking it is learned that plans are going ahead aiming at the connecting of the underground workings of the Burnside with the Tough-Oakes. This fact appears to indicate the probably successful culmination of the rumored consolidation of the Tough-Oakes, Burnside and Sylvanite properties. Such an amalgamation would provide a large acreage of highly mineralized territory and should mean that the 140-ton mill should be in operation at full capacity by the middle of the coming summer.

The Flin-Flon Property, Manitoba.

The great sulphide ore deposit at Flin-Flon, around which there is considerable interest at this time, was located and staked in August, 1915. It was found by Tom Creighton and Jack Mosher, who had as associates Isadore and Leon Dion, Dan Milligan and Dan Mosher. These men were sent out to prospect by Messrs. Alec Fasken, John Hammell and Frank Curry, of Toronto.

Mr. Hammell interested American capital, and, through Messrs. Hayden & Stone (acting for the Tennessee Company and others), the property was optioned at $4,000,000. Two diamond drills were operated in 1916, for a period of four months, when Messrs. Hayden & Stone withdrew. Mr. Alec Fasken, acting for others, took over the work and continued the drilling. Some forty holes were put down, at an average of 1,600 feet. The orebody averages 125 feet in width on the surface, and 2,500 feet in length. It is carefully estimated to contain 25,000,000 tons of ore, at a value of $10 a ton. Outside of drilling surface stripping has been done, and some twenty camp buildings erected. It is estimated that $300,000 has been already spent upon development work.

The owners of the porperty are Messrs. Hammell, Fasken and Currie, who control three-quarter interest, and Messrs. Creighton, Jack Mosher, Leon Dion and Dan Mosher, who control the balance. Messrs. Isadore Dion and Dan Milligan, of the original owners, sold out to Mr. David Fasken for $25,000 apiece. Messrs. Creighton, Jack Mosher, Leon Dion and Dan Mosher received a first payment of $5,000 cash from Mr. Fasken.—The Pas Herald.

THE WESTERN COMMERCIAL COAL CO.

Recent years have seen a wonderful development in the coal industry in the province of Alberta, especially in the Drumheller district, which has become famous throughout Western Canada, and is destined to be a large factor in the coal supply of the West. The Western Commercial Co., Ltd., mine operators, among the latest, have shown considerable activity in their mine situated at Wayne, nine miles east of Drumheller, and on the Goose Lake Branch of the Canadian Northern, where extensive deposits of subbituminous coal has been located in the valley of the Rosebud for a distance of 400 feet in depth. The seam has been traced to the crest of the valley. Development work was started in June, 1916. The following year 80,000 tons was mined, and in 1918 100,000 tons was produced. The output for 1919 is expected to reach 150,000 tons. Saskatchewan has absorbed the largest portion of this, with Alberta and Manitoba next in order.

Several thousand dollars were expended in equipping with mining machinery, so that every facility is on hand for the rapid working of the mine. Being alongside of the railway quick shipment can be made to all points. The head office of the company is situated at Calgary, with branches at Moose Jaw and Saskatoon.

The Canadian Northern Railway, since it came under the control of the Government, has just completed the double track of the road from Drumheller to Saskatoon, which will facilitate the rapid movement of both coal and grain, so that it is expected henceforth no delay will be encountered in supplying Saskatchewan and Manitoba, such as occurred a yaer ago. R. Wheeler.

The Mandy Mine, Manitoba.

The lens of high-grade copper ore at the Mandy has been excavated to the 200 ft. level, thus clearing out all the lens so far as explored. It was worked from the surface from open cut methods for 60 ft. A shaft was then sunk to the 100 ft. level, near the south end of the lens, and the lens stoped from that level.

From the indications from the 100 ft. level it appears that the lens would finger out towards the south-east about 30 feet below that level. On sinking to the 200 ft. level, however, the northern boundary of the lens, which, at the 100 ft. level, was dipping towards the south, was found to go down vertically, and a much larger body of ore than had been expected was stoped from the 200 ft. level. The percentage of copper was also higher at this depth, and continued higher to the bottom of the lens which was found by under stoping at about 25 feet below the 200 ft. level. Below this the ore passes into the zinc-copper mixture, too low grade for present transportation methods.

There is probably 1,000 tons of high grade ore still available in the stopes and 1,000 tons still left in the dump at the shaft. There are 7,000 tons at the foot of Schist lake, and the camp has been moved from the mine to the new camps at Schist creek, near their dump. This ore will be transferred by wagon to Sturgeon Landing, where there is already 7,800 tons on the dump. The teams will swing from Schist creek straight to Camp 2 on Athapapuskow lake. Other teams swing from Camp 2 to the half-way on the Goose Creek. returning at night to Camp 2. Still other teams swinging from camp at Sturgeon Landing to half-way on Goose creek, return at night with the ore. Each team now carries approximately 6½ tons, and there is being delivered at Sturgeon Landing, on an average, 220 tons per day.

At this rate all the ore (15,000 tons) will be delivered at Sturgeon Landing by March 21st, almost a week before the average date of break-up of the roads. At the same time, 3,000 tons will be delivered to the big bend on the Saskatchewan river, double teams swinging from Sturgeon Landing to the half-way just north of Rocky lake, and other double teams from the camp at the big bend to the half-way and back with the ore; 200 tons have already been delivered at the big bend. The total distance of haulage from the mine to Sturgeon Landing is about 40 miles, and to the big bend from the mine about 65 miles.

Having taken out all the high grade copper ore in sight, the Mandy Mine is closing down further active mining. There remains considerable tonnage of low grade ore, but present conditions will not warrant work upon it. The diamond drills will continue exploration from the 200-ft. level.—The Pas Herald.

GREAT INTEREST IS BEING SHOWN IN NORTHERN B. C., AND THE YUKON DISTRICTS.

Many inquiries are coming in from old time prospectors regarding the condition of the ice on the Yukon and the break up of the Yukon River is eagerly looked for. There is talk of great mine development in the North this coming year, and mben who have known that country for many years prophesy great prosperity in the old stamping grounds of the prospector and this is borne out by the inquiries that are being made at the present time.

Kirkland-Porphyry.

The litigation between the minority interests of the Orr Gold Mines represented by David Elliott, of Haileybury, and the Kirkland-Porphyry Gold Mines is still unsettled, the case having been heard this week in Toronto, the decision having been reserved.

A Copper Discovery in Manitoba.

According to "The Pas Herald," one of the most important discoveries of ore is said to have been made within a half mile of the Hudson Bay Railway, at Mile 191. Samples of the ore were shown to Commissioner Wallace, and some sent to Paris. It is a copper sulphide ore, with nickle, gold, silver and galena.

John Forbes is the finder, and he staked 104 claims in all. He got these claims in the late summer, and worked quietly away sinking a shaft to 75 feet. He says the mineral body is 7,000 feet long and 72 feet wide, extending over nine claims. He says there is 40 feet of iron capping before reaching the sulphide ore.

Mr. Forbes located the ore four years ago, but was unable to stake because of the regulations reserving all land within a half-mile on both sides of the railway. This regulation was withdrawn in 1918. He remained near the ore discovery for four years, hugging his secret for the time when the restrictions upon staking would be removed. The report of his discovery has caused quite a flutter among prospectors, and considerable staking is being done between Miles 191 and 195.

Mr. Forbes optimistically says that this ore body is larger than Flin-Flon, and the ore is much richer in copper. He thinks the tonnage is greater in volume and can be handled more economically. A sample assay from the four corners and middle of the shaft, at 60 feet, gave $170 in copper.

Professor Wallace states that the nickle showings were the best he has seen. He thought, in view of the fact that the surface showed weathered iron only, there must be good possibilities underneath, since high grade copper was encountered so heavily at 60 feet.

Mr. Forbes is backed by T. R. Edwards and Ward Hollands, of Winnipeg, who have prepared a program of exploration from Mile 86 to Mile 211, to cost $50,000.

WANTED.

WANTED—Ball Mill. Capacity about 50 tons per 24 hours. Preference given to Marcy Mill. Monarch Metal Company, Limited, Main St. W., Hamilton, Ont.

POSITION WANTED as Superintendent or Manager for Gold, Silver or Iron Mine. Also Assessment Work. Mining Properties for sale at Boston Creek. Capt. Albert Johnston, Boston Creek, Ontario.

Oxy-Acetylene Welding and Cutting

Welding New Teeth On Metal Gears

This is almost an everyday use for the Prest-O-Lite Oxy-Acetylene welding apparatus. Such a repair prevents many a serious tie-up, and saves the expense of replacements.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is baked up by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and guages, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Address Department C — 108

Prest-O-Lite Company of Canada, Limited
Prest-O-Lite Building
Cor. Elm St. and Centre Ave.
Toronto

Plants at :—
Toronto, Ont. Shawinigan Falls, P.Q
Merritton, Ont. St. Boniface, Man.

World's Largest Makers of Dissolved Acetylene

THE VANCOUVER CONVENTION.

There was held in Vancouver, March 17, 18, 19, a nvention that should help to draw attention to the eat mineral resources of the West, particularly those British Columbia. The Pacific province has long en an important producer of minerals, but only a nall part of the big province has yet been developed. The Committee in charge of the arrangements spared effort to make the Convention a success. Western ining men attended in large numbers. Hundreds of aste-ners would have liked to attend, but the long urney made attendance impossible for more than a w.

Among the important subjects of discussion were: old mining in British Columbia; legislation to make ssible the reduction of local ores within the pro- nce; possibility of establishing a smelter and refin- y on the Southern Coast of British Columbia; taxa- on of mining properties; the prospector and how to courage him; better utilization of British Columbia al.

All these matters are of vital interest to the indus- y. Some of them are more particularly important Westerners, but even these demand the attention men in other parts of the Dominion. Some of the bjects are of great general interest.

The men whose efforts made the Convention pos- ble deserve much credit. We have no doubt that good sults will follow, that further discussion and action ill lead to the solution of some of the many problems hich confront those who endeavor to utilize our re- ources to better advantage.

A full account of the Vancouver Convention will be ublished in our next number.

MINING TAXATION.

The mining industry must bear its share of the cost government. It is incumbent on those engaged in e industry to see that it be not burdened with more an its share and to see also that the burden be justly istributed among them. Discussion on mining taxa- on is therefore properly undertaken by members of ie Canadian Mining Institute. All members are di- ctly interested in the Federal taxes. Also, since the rovinces need money, the various branches are in- rested in Provincial taxation.

At the recent meeting of the Canadian Mining In- itute an excellent paper on the general principles of ining taxation was presented by Mr. T. W. Gibson. le recognizes that taxation must be fundamentally ased on profits, no matter what is called the basis. le holds that the destination of profits or the pur- o es for which they are used, being wholly in the ntrol of the company, should not affect the right f the state to its share. We imagine that all will gree with him in this. The value of a mine is de- rmined by the profits it will make. Taxation in any rm is therefore properly determined by the profits ven if, as is sometimes done, it is based on valuation of he property.

But though all recognize that the proper basis for taxation is profits; there are many opinions as to how the principle should be applied. Determining the profits during the life of a mine is not a simple matter, in fact, perfectly accurate determination is impossible. We can only make approximate estimates. It is the making of such estimates that leads to much difficulty and many differences of opinion. It is the proper business of those in the industry to see that such estimates are as nearly accurate as the known facts make it possible. It is also the proper business of those in the industry to see that others who have a voice in determining taxes should not be allowed to reach inaccurate conclusions owing to lack of knowledge of the determinable facts. Attempts to tax capital invested in the industry under the pretext of taxing profits should be fought to the last ditch. Some, if not all, such attempts may be attributed to failure of the tax gatherers to appreciate the facts. It is a recognized failing of tax gatherers that they will take any money that they can legally get their hands on. We have to see to it that the laws are so framed that they get only a just amount and from the proper sources from the profits and from the profits only.

While it is evident that a perfectly accurate estimate of profits cannot be made during the life of a mine, it must be admitted that the state canot wait until the profits are accurately determined. Taxation of mines is therefore likely to be applied unfairly. We can only hope to devise methods that will result in a close approximation to proper distribution.

Since the profits cannot be accurately determined in advance, a close approximation to correctness demands short term assessments. The basing of taxation on annual profits is therefore more nearly accurate than any system which, like that of estimated value of the property, implies ability to determine profits for several years ahead.

REDUCTION OF CANADIAN IRON ORES.

One of the matters which has recently received much attention in British Columbia is that of devising ways and means for the utilization of the known iron ore deposits. The establishment of a local iron and steel industry is much to be desired. Last summer the Provincial Government commissioned Dr. Alfred Stanfield of Montreal to make an investigation into the situation and his report on the commercial feasibility of the electric smelting of iron ores in British Columbia has recently been published. Dr. Stansfield reported that there is a sufficient quantity of iron ore conveniently located, water-power available for development of electrical energy, and waste wood from saw-mills for production of charcoal. He considers that iron ore, power and charcoal could be produced sufficiently cheaply for the commercial smelting of iron ores in electric furnaces; but that the power available now is too costly and development of water- power at this time inadvisable owing to high costs. He reports that it appears advisable; to develop more

of the best iron ore deposits and to make complete tests of the ore; to reserve a suitable water power for future development; to establish a plant for the economic production of charcoal from mill waste; and to investigate the new process for the production of pig iron, and if this is found satisfactory to begin immediately to produce pig iron, purchasing power for this purpose until the water power can be developed.

It is to the last of these proposals that we would direct attention, for the utilization of such a process has been under investigation in Ontario for some time. Some account of the new method is given in this number of the journal by Mr. Jas. W. Moffatt, who has had long experience in the making of iron and steel in electric furnaces and by Mr. Stansfield in his report. It was apparently to such a process as that devised by Mr. Moffatt, that Dr. Stansfield refers in his report, though he is not very clear on this point. At least the processess are similar in that the main idea is the separating of the two stages of the smelting process and carrying them out in separate furnaces.

In Ontario and Quebec as well as in British Columbia there are many iron ore deposits which will become valuable if the new process proves successful. It is to be hoped that it will be well tried out.

The iron industry of Canada is not one of which we are very proud. It is true that we turn out good iron and steel and that we contributed a large quantity of much needed munitions during the war, but the utilization of Canadian iron ores lags far behind the capacity of our furnaces. We are almost entirely dependent on imported ores for our iron. Our great plants in Nova Scotia draw their ore from Newfoundland. The rest of Canada depends largely for its iron ore on the Lake Superior States.

Ontario, Quebec and British Columbia have in the matter of utilization of domestic iron ores a problem in common. They might well unite in testing out the new process. In the several provinces and for each deposit there will be variations of the problem; but there is much in such an investigation that would be for the common good.

THE "BLUE SKY" BILL IS DEAD.

The Arroney-General of Ontario has acknowledged that his "blue sky" bill needs much consideration and revision before it is enacted. In its present form, the bill, so far as mining companies are concerned, is dead. It is to be hoped, however, that some of the ideas for the protection of investors may be put into practice. A new draft, with the objectionable features eliminated, should be prepared at an early date, so that there will be plenty of time for consideration before another bill is presented next year. We assume that Mr. Lucas will not be so discouraged by criticism that he will fail to make another effort. The bill has brought out much information that should help him in drafting a bill that would meet with the approval of those engaged in mining.

It cannot be too often pointed out to the public and our governments that the development of rich mineral resources is only possible so long as there are rich prizes for those who are successful. If by over heavy taxation the successful companies are deprived of their reward, there will be fewer deposits developed. If, by legislation, development is limited only to properties that are certain to prove profitable, there will be no deposits developed.

There is no certainty that any deposit discovered will be worked profitably. Some prospects are more promising than others and the chances may then be considered very good, but among undeveloped properties there are few, if any "sure things." Those who spend money in development take big risks. It is proper that the risk should be taken by those who are able to stand the probable loss, for the number of failures is far greater than the number of successes. The selling of shares to the general public is therefore to be commended, for the losses are thus more widely distributed and more easily borne. If there were certainty of success there would be no necessity for public subscriptions.

It is also proper, however, that those who are granted permission to sell mining company shares to the public should be required to file an honest statement of the affairs of the company and real descriptions of the property. It is also desirable that such information should be very readily available, so that shareholders may learn as much about their property as is reasonably possible. The public should be encouraged to take the risks involved in developing mineral deposits; but they should be well informed as to the nature of the risks.

It is natural that some persons will take improper advantage of the privilege to sell shares. There should therefore be provided severe penalties for offenders and suitable machinery for prosecution. It was probably with this object in view that Mr. Lucas drafted his bill. Unfortunately, some of the provisions of the bill are so drawn that, owing to the nature of the industry, the effect would be to prevent desirable flotations in order to make sure that there were no undesirable ones.

It would be very regrettable if the bill as drafted had been enacted. Assurance has, however, been given that the bill, if enacted, will not apply to mining companies this year at least. We hope that it will never be revived in its present form.

British Iron and Steel Manufactures May Now be Exported Without License.

Advices have been received by Mr. G. T. Milne, Montreal, and Mr. F. W. Field, Toronto, British Trade Commissioners in Canada, that the following additions have been made to the list of goods which may be exported without license:

Fancy goods made of Morocco and light leathers; iron and steel manufactures generally except high speed steel and certain special articles; machinery of all kinds except textile machinery and machinery wholly made of brass or copper; toys and dolls; games of all kinds.

PERSONALS.

Mr. J. B. Tyrrell has been elected a member of council of the Institution of Mining and Metallurgy, London.

Mr. Robt. Bryce has returned to Toronto after examining a property in Nova Scotia.

Mr. G. C. Bateman has returned to Cobalt.

A meeting of the Toronto branch of the Canadian Mining Institute was held on Saturday, March 29th.

A New Method for the Smelting of Iron Ores

A Process Designed for the Treatment of Canadian Ores.

By JAS. W. MOFFATT.

A new method for the production of metals from their natural oxide ores, or from their roasted sulphide ores, lies in the duplexing of two known furnaces. The ore is first treated in a "reducing" furnace of comparatively low temperature in which the ore is deprived of its oxygen as completely as possible and is then known as "sponge." This product is transferred, either hot or cold, into an electric furnace to be melted down and finished into any desired metal. More particularly, it is for the manufacture of iron and steel and their alloys, and naturally the finishing of the metal in the melting furnace makes the process a discontinuous one,—one more convenient in operation and more suitable for meeting trade demands.

Iron Sponge.

Iron sponge has been defined by Raymond as "metal in a porous form obtained by reduction *without fusion.*" Approximately its weight is about one-third that of cast iron.

In past efforts, the reduction of the oxide ores has been attempted with the use of a gas, but without substantial commercial success, as it is very difficult to get practically complete reduction without lengthening out the operation too long, and when the ore has been finely crushed, the reduction is very imperfect.

The earliest workers in iron must have been familiar with iron sponge in their crude forges, as they used the sponge, with further application of heat, for making the balls they hammered and squeezed into a malleable metal. Many subsequent efforts have been made to use it, but certain difficulties have been found to seriously interfere, and it is rarely heard of except in the trade.

These difficulties were largely encountered in the securing of complete reduction of the ore, in the lack of careful and accurate control of the heat and partial fusion or melting than occurring in consequence, and there was always present the difficulty of handling a material so readily oxidizable, for it will reoxidize both in cooling down and in being heated up again to bring it into a liquid state if an oxidizing atmosphere is present.

Temperature control is now easy and accurate with pyrometers, guidance in the control of gas analysis can be had with the use of CO_2 recorders, and a sure and certain atmosphere of reducing gas, in which to melt the sponge without reoxidation, is securable in the electric furnace.

In the manufacture of iron sponge, excellent information can be had in a study of H. H. Campbell's "Graphic Representation of the Weight of Substances in the Blast Furnace," as it also shows the temperature at which the various chemical reactions take place. Hematite (Fe_3O_4) begins to be reduced at a temperature of about 300° C., and has been converted wholly into magnetite (Fe_3O_4) at a temperature of 450° C. This ore, with the natural magnetite in the charge, begins to be reduced to ferrous oxide (FeO) at a temperature of about 500° C., and the reaction is complete at about 590° C. Ferrous oxide begins to be converted into iron (Fe) at 700° C., and the reaction becomes more rapid when 700° C. is reached, and is complete when a temperature of 800° C. is reached, all the iron being in a spongy metallic state. The sponge iron is all melted when temperatures of 1100° to 1300° C. are reached, there being some variation in the heat required according to the analysis of the iron.

It may be noted that at 800° C., the limestone of the charge is converted into lime, and in a furnace operated for the reduction of ore the stone is advantageously mixed with it, as it will act as a catalyzer and speed up the reaction. It would be inadvisable to add stone with iron sponge in the charge of the electric furnace, since carbon dioxide will begin to oxidize spongy iron at a temperature of 300° C. as pointed out by H. H. Campbell in what he calls the "landmarks" in the smelting of iron ores. The foregoing data is based on the average work of a 75 foot blast furnace, but clearly the size of the ore and the time occupied by it in passing through any particular zone of temperature must be taken into consideration of the occurrence of each reaction. The writer has made a few ounces of iron sponge at different times in experimental work when the entire operation did not take five minutes.

Previous Efforts to Utilize Iron Sponge.

Efforts have been made to utilize iron sponge in various types of furnaces, some of which may be quoted.

Harvey devised a process in which coarsely ground ore, mixed with charcoal, was placed on inclined shelves within a puddling furnace in a position that allowed it to be heated by gas entering the furnace, and, when deoxidation was thought to be complete, the reduced ore was raked off the shelves, further heat was employed to fuse it, and under it the sponge was worked into the puddled balls.

In Clays process, the reduction was effected in retorts made of fireclay, the ore having been mixed with carbonaceous material, the heat being applied externally, and the sponge iron product was then further heated and balled. It is said that his process proved slow and costly, and the iron was not always satisfactory.

Newton also used a closed container in a somewhat similar way, heating it externally to a white heat for about 48 hours, and taking the product while hot to a puddling furnace or when cold to a crucible furnace. Such a prolonged operation was naturally an expensive one.

Roger mixed ore with coal, and effected reduction in a rotating cylinder, heated externally. This he located above his puddling furnace into which the resulting sponge was dropped, further heated, and then balled.

The Carbon Iron Co., deoxidized iron ore in a reverbatory furnace provided with a carbonaceous hearth. The ore was mixed with retarded coke,—which oxidizes very slowly,—and the reduction of the ore was slow in consequence, but the sponge had the advantage

of resisting oxidation in further handling better than in the other processes mentioned.

Some attempts have been made to use iron sponge in the crucible furnace, of which a few may be noted.

Belford put a mixture of iron ore and carbonaceous material into a suitable container, heated it externally, and transferred the sponge while hot to crucible, and then melted it down, but in later practice transferred it through a closed runner to a decarburizing chamber, heated externally, where it was acted upon by decarburizing gases or steam. Evidently he found his sponge too high in carbon for making steel by the crucible process.

Lucas used a furnace similar to that employed in the cementation process, reducing in a covered container, and melting the sponge in crucibles.

The utilization of iron sponge has also been tried out in the open hearth furnace.

The Carbon Iron Co., coated the sponge made with lime to retarol its oxidation in the transfer and during the melt down in the open hearth furnace,—the coating would naturally be put on while the sponge was still on the hearth of the reverbatory.

Tourangin made sponge and protected it from oxidation by covering it quickly with ashes as soon as it was withdrawn from his furnace, or he dropped it into containers with water-cooled walls, covered it with air-tight cover and allowed it to cool down.

Trosca dropped his sponge into an air-tight buggy.

There are many other processes in which the use of iron sponges was attempted in the puddling, crucible and open hearth furnaces, but all of them could only be considered as furnishing part of the metal used in the finished iron or steel, and all would certainly in their time introduce more or less iron oxides into the bath of molten metal and in consequence increase the work of finishing the metal, for carbon dioxide in the gas used will oxidize iron sponge at as low a temperature as 300° C. in the melting down period.

Of the older types of furnace, there remains the blast furnace, and at first glance it would seem as if an agglomerated iron sponge would be able to take the place of briquettes and furnish a means of disposing of comminuted ores; but unfortunately the gas at the top of the furnace is too oxidizing as there is usually 10% to 17% of carbon dioxide present and only 20% to 27% of carbon monoxide. The sponge while being heated in the upper regions would be re-oxidized, and all the work previously done on the ore would be wasted, and have to be done over again on the material reaching the reducing zones of the furnace.

The New Process.

How the sponge is made is immaterial to the writer's process (Canada patent No. 186994, granted Oct. 15th, 1918; United States patent No. 1,294,514, allowed Oct. 26th, 1918, and issued Feb. 18th, 1919) of duplexing a reducing or metallizing furnace with an electric melting furnace.

Any scrap melting electric furnace, that can be made practically air-tight, melts the iron sponge as readily as it melts the scrap,—no special design of electric furnace is necessary for the process.

The design of a reducing furnace must suit the materials used for supplying the heat and the means of reduction, for what may be the most convenient and economical in one locality may not be so in another.

As noted already, reduction is an easy operation to carry out successfully with the assistance of modern scientific apparatus, and when the crude methods of the past are replaced by well designed furnaces for making iron sponge solely.

Such furnaces should be mechanically charged, rabbled and discharged, and means should be provided for making small additions of carbon to the charge when necessary. Preferably, the gases of combustion supplying the heat should not be passed over or through the ore being reduced. As the porosity of the ores is variable, and all ores may not be crushed to the same degree of fineness. The time occupied in the work will vary, and the furnace should be designed to take care of that. It should also be supplied with at least one, and preferably two, stationary pyrometers, indicating by colored flash lamps any variation, up or down, from the proper temperature.

An intelligent laborer could operate a number of such furnaces and the labor cost per ton of ore would be very low.

Perfect reduction at the lowest cost is the one consideration however, and how it is actually arrived at is quite secondary.

Any scrap melting electric furnace, that can be made practically air-tight, melts the iron sponge as readily as it melts the scrap,—no special design of electric furnace is necessary for the process.

Canadian Ores Available.

Ores of high metallic iron content, say 63% and over, in the crude state, are becoming increasingly difficult to get in Canada and the United States within reasonable transportation distance of any market. One of the largest concerns in the United States catalogues the product of thirty odd mines without showing one such ore; seven however range between 60% and 62%. Outside of the Helen and Magpie mines of the Algoma Steel Corporation, the Atikokan mine of the Atikokan Iron Co., and the Moose Mountain Mine of the Moose Mountain, Ltd. The orebodies in the older and more populous parts of Canada are not large, and are of low grade as a rule.

In Ontario, except the ones mentioned, no really large property has been thoroughly proved to contain one million tons of marketable ore, though there are a few of undoubted promise, such as the Canada Iron Mines properties in Hastings County and the Belmont mine in Peterborough. There are, however, many small bodies of ore in Ontario, situated conveniently to the market.

In the 48 years between 1869 and 1916, the Dominion Government reports show a total production of about 4,350,000 tons of iron ore in Ontario, an average of 90,625 tons annually, or a little less than 250 tons daily, an amount insufficient to alone supply one very small blast furnace.

In the Province of Quebec, from 1886 to 1916, a period of 30 years, there was a total production of 379,953 tons, making the yearly average 12,655 tons, or a daily average of 35 tons.

New Brunswick in 68 years,—1848 to 1916, produced 272,850 tons, a yearly average of 4,013 tons, or a daily average of 11 tons.

Nova Scotia in 30 years,—1886 to 1916,—produced 1,279,637 tons, a yearly average of 42,655 tons, or a daily average of 117 tons.

British Columbia in 30 years,—1886 to 1916,—produced 65,078 tons, and exported practically all of it to the neighboring State of Washington. This tonnage is a yearly average of 2,170 tons, or a daily average of 6 tons.

The other Provinces have done little or nothing in mining iron ore. Dominion Government reports also supply other statistics of the total output of all Canada. For a period of 30 years,—1886 to 1916,—the total production was 5,759,540 tons (2,000 lbs.) a yearly product of 191,985 tons, or a daily average of about 526 short tons, or 470 long tons, the latter being the ton used in the pig iron market. This 470 long tons of ore would have to carry about 55% metallic iron to meet the supply required for only one small blast furnace making 250 tons of pig iron daily, which is one-half the size of what is considered a good furnace to-day, when they are being built to produce up to 600 and 700 tons of pig per day.

In 1916, the United States produced about 75,500,000 tons of ore. The population being about 100,000,000; this is equivalent to 75.5 tons per 100 of population. The same year, Canada produced from her mines 340,000 tons, or 4.25 tons per 100 of population, or about one-seventeenth of what the United States did!

This is a pitiable showing when it is remembered that our geologists claim that the great producing iron ranges found in the States of Minnesota, Michigan and New York are also found in Canada, and that the last twenty years, in the thirty year period of production mentioned, include what is proudly called "Canada's growing time." There are undoubtedly many reasons why such a state of affairs exists. Some can be removed by legislation,—but the great cause of the trouble is that few of our iron mines with convenient shipping facilities can produce even 100 tons per day, and the great majority of all Canadian ores unfortunately require crushing, grinding and concentration with subsequent briquetting to render them acceptable to blast furnace operators. This cost of briquetting finally proves to be the last straw, and then nothing is done.

The Canadian blast furnace operator is able to deal with one American selling agent for his entire requirements in ore for a year's run, feeling absolutely sure of its delivery to him and of its being according to the analysis guaranteed him when making his selection. It might be added that, when that ore enters Canada, there is the enormous duty of eight (8) cents per ton to be paid on it,—and no war tax! However, if he imports his ore from Great Britain, he does not have to pay so high a duty, he can get it into Canada for six (6) cents per ton, and without a war tax as before!

New Process Will Make Canadian Ore Marketable.

It is natural to ask how can such an unfortunate condition be overcome. The best solution seems to lie in the utilization of the scores of small iron mines that are to be found between the Lake of the Woods on the west all the way down the north shore of the Great Lakes water system to the Straits of Belle Isle on the east. As there are very many large water powers available for the generation of electricity at points sufficiently convenient for the transmission of the power to suitable smelting locations, the past difficulties can be largely overcome by a reversion to the use of the iron sponge of the ancients, melting it in the very modern electric furnace, with its ideal conditions for that work, and, without removal, finishing the metal into any desired iron or steel.

Market for Product of Duplexing Process.

And what about a market for the product? It is not at all likely that the electric furnace can market ordinary pig iron in opposition to that made in the blast furnace, except under most unusual conditions, such as a very long haul from blast furnace to that market where an electric furnace is operated. Low-phosphorus—high-silicon pig iron, however, could be made for sale to the open hearth steel furnaces, and some washed metal (metal with the phosphorus, sulphur and silicon practically eliminated) and other special irons would have some market.

The natural product of the electric furnace is steel, and to that metal its work is advantageously confined from a financial point of view. It is particularly well suited to furnish the molten metal in a steel foundry, but this class of work is only prosperous in the centres of large population, and most of our smaller iron mines are situated at some distance from the cities.

During the war there was a ready market found in casting ingots for the forging of shells. The war taught us new possibilities. If existing forging and rolling plants are not disposed to continue that practice, the electric furnace plants could cast ingots, scrop them, (remelting the cropped ends with the iron sponge of the next heats), and ship the ingots to a district forging works or rolling mill which they themselves had combined to build and operate. A plate mill would find a ready market for its entire output in Ontario for instance. Rolling billets, too, would probably be satisfactory. Electric furnace steel, owing to its superior quality, will always find a sale in competition with other steels, and at a higher price even when steel of high quality is wanted.

Magnetic Concentration of the Ore.

Under the new process, the ore should be crushed fine enough to effect the best magnetic separation of the iron oxide from its associated gangue, usually silica. It is rather expensive to get rid of rock material by means of slags made with electric heat in a furnace, and an ore should be concentrated up until it carries as high a metallic iron content as possible,—over 63% say, though no hard and fast rule can be laid down, as it all depends on the analysis of each ore.

Reduction.

For reduction purposes, the carbonaceous material should be ground to the same size of grain as the ore and be very thoroughly mixed with it. Its analysis should show the weight of fixed carbon, volatile matter, moisture and ash. Theoretically the metallic iron should have one-quarter of its weight of fixed carbon present for complete reduction, but in practice a further small percentage is added. For example: 1,000 lb. of 65° iron ore (Fe_2O_3) has 650 lbs. of metallic iron, and theoretically requires 162½ lb. of fixed carbon for complete reduction, which would be found in 271 lb. of charcoal showing 60% fixed carbon in analysis.

Limestone, also finely ground like the concentrates, may be mixed in the charge, and will be calcined in the process, or it may be added as lime in the electric furnace. There should be enough lime present to make a very basic slag in the melt down in the electric furnace.

In the iron sponge making operation, there will be a considerable elimination of the sulphur in the ore, and to some extent a lowering also of the phosphorus in some ores.

Handling the Iron Sponge.

The iron sponge may be handled hot or cold. When transferred hot, the reducing furnace should be provided with means for discharging its contents into containers having air-tight valves, taking every care that air is not allowed access to it while the discharge is being made. The containers must be discharged into

the electric furnace, with like care, and preferably through the roof, the furnace having previously rendered air-tight. The current can then be put on, and it will be noticed that the charge will carry the current steadily at once without the very objectionable surging found in melting cold scrap. Indeed if the sponge is only reasonably warm, this will occur, and the running will be smooth.

The reducing furnace may be provided with a large air-tight cooling chamber underneath into the top of which the iron sponge may be dropped when reduction is complete. When this chamber is constructed to hold the product of several runs, it becomes a storage bin as well, with the lowest charge cooled below the oxidizing temperature. But, still being warm, it could be transferred without care and be charged into the electric furnace through its regular doors.

In the case of a low grade hematite, or a mixed hematite and magnetite ore, which ores do not answer well to magnetic concentration, a partial reduction to Fe_3O_4 will render it well suited for it as a rule.

Fuel.

The heat required for the chemical reactions can be either secured by burning coal or coke on a grate, or by using these in powdered form blown in with air to a combustion chamber or by using liquid fuel such as fuel oil. The burning gases from any of these fuels should heat externally the container in which the work of reduction is being carried, but preferrably should not be allowed to enter it. If electric heat is used it can be applied in the same chamber as that in which reduction is going on.

The operation of the electric furnace is practically the same as in melting and refining scrap, and no description is needed of it to-day.

Comparison With the All Electric Heat Method.

With the Swedish electric furnace (Electro Metals Co.), it requires about 1.1 K.W. hours of power to produce 1 lb. of metal, and the metals is a white iron only. This is equivalent to 2,200 K.W. hours for a net ton. It is transferred while liquid to an electric furnace, where about 300 K.W. hours of additional energy are reqired to finish the metal into steel, making the total energy used about 2500 K.W. hours from ore to steel.

Properly reduced iron sponge melts as readily as cold scrap, which can be melted and finished in good practice with 700 or 750 K.W. hours per ton. As the rock material remaining in the iron concentrates will frequently necessitate a larger amount of lime to secure a very basic slag. The weight of the slag used in the iron sponge process will be some larger than that in the scrap melting process.—probably a fair average will be 800 K.W. hours with the sponge using process. or about one-third the amount required by the all electric process used in Sweden.

In this new process no high temperature heat is lost in waste gases leaving the electric furnaces, as there will be practically no gas generated there, and, compared with the all electric heat processes, using 1700 K.W. hours of energy more than that required in the process using iron sponge, where the heat for reduction is got from lump coal, powdered coal, fuel oil or any of the ordinary available fuels, the economy in the production of steel by this method is readily seen.

Quantity of Ore Required One 6 Ton Furnace Heat.

A 6 ton electric furnace (1500 K.W. or 2000 H.P.) will require the iron sponge made from about 10 tons of 63% Fe. concentrates per heat. Four heats can be easily be made in 24 hours, but a skilled furnace operator could get five if the plant is conveniently arranged. Taking the number of heats at four, a six ton furnace would then readily produce 24 tons of liquid steel in 24 hours, and would require 60 tons of 63% of Fe. concentrates for it. If the ore mined would need concentration of 1½ into 1 to produce 63% Fe. concentrates, one 6 ton furnace would use 90 tons per day of such crude ore.

Iron Sponge Will Cost Less Than Scrap.

Owing to the existing instability of the prices of materials, and to the labor unrest it appears to be quite inadvisable to make any attempt to quote an average cost for either plant or product,—a cost quoted to-day will probably be useless a few months later. Iron sponge, however, will cost less than scrap, as soon as the war scrap is all used up.

Patent Claims.

The following are the main claims granted in the patents,—they are identical in Canada and the United States:—

1. A discontinuous process of treating metallic oxides ores which consists in reducing a charge of ore without fusion in a suitable furnace, and after reducing, excluding oxidizing gases from contact with the charge while its temperature is above the lower limit at which re-oxidation can take place, placing the reduced charge in a separate electric furnace and fusing it there in an inert or reducing atmosphere.

2. A discontinuous process of treating metallic oxide ores which consists in reducing a charge of granular ore without fusion in a suitable furnace and at as low a temperature as possible to maintain the granular form of the reduced ore, and after reducing, excluding oxidizing gases from contact with the charge while its temperature is above the lower limit at which re-oxidation can take place, placing the reduced charge in a separate electric furnace and fusing it therein in an inert or reducing atmosphere.

3. A discontinuous process of treating metallic oxide ores which consists in reducing a charge of ore without a flux without fusion in a suitable furnace, and after reducing, excluding oxidizing gases from contact with the charge while its temperature is above the lower limit at which reoxidation can take place, placing the reduced charge in a separate electric furnace and fusing it therein with a flux in an inert or reducing atmosphere.

4, 5, and 6. Cover the cooling of the charge after reduction and before fusion to a temperature below that at which reoxidation can take place, as already set out in 1, 2 and 3.

FLORENCE SILVER.

Another monthly dividend has been declared by the Florence Silver Mining Co., amounting to 1½ cents a share. A body of ore has been opened up from Stope No. 7 from No. 2 tunnel level. At a point 30 feet up it shows two feet of clean shipping ore running nearly 70 per cent. lead and 22 ounces silver, with five feet of milling ore. This is in virgin territory, west of the big original orebody which was stoped to surface and showed maximum width of 40 feet. Vertical depth from surface is about 350 feet, so that the orebody can be followed up to surface on the dip about 500 feet. The downward continuation of the same body has already been developed by No. 5, or lowest level, 360 feet down on dip of vein. Intermediate level No. 3 and 4 have not yet been extended far enough westerly to catch it. No doubt is felt, however, that the shoot will be opened up on all four levels.

EXAMINATION AND SUPERVISION OF COAL MINES.

"It is time that British Columbia ceased being the happy hunting ground of aliens. We propose, therefore, that there shall be a more rigid examination and supervision of all who are permitted to enter our mines."

These sentiments were emphatically asserted by Hon. Wm. Sloan, Minister of Mines, when moving the second reading of a Bill to amend the Coal Mines Regulation Act. Taking the measure by section he first referred to that which provides for the appointment of a Minimum Wage Board. This principle, he said, was not new to British Columbia, having been laid down by the Provincial Legislature at its last session and having wrought, he thought, generally satisfactory results. Coal mining was a dangerous industry and for that reason it was particularly apt that the principle should be applied to it. It was to be understood, however, that the Minimum Wage proposal did not extend to all the underground workers, but only to the actual miners who held certificates of competency. Of these there were in British Columbia 1685, of whom 156 were Orientals. The argument that it was discriminatory to permit the establishment of a minimum wage district in one section while another, perhaps adjacent, was excepted was answered by the statement that such action might be warranted by entirely diverse sets of conditions in different districts, in fact such differences might exist between mines in the same locality. In this respect the Act followed closely the British Act, there being 23 Minimum Wage Districts in Great Britain. In British Columbia it was intended to define not more than 3 or 4. As to the cost which also had been advanced against the contemplated amendment Mr. Sloan stated that it was the intention that the Chief Inspector of Mines should be the board's chairman and, as the other two members would be appointed from the particular districts affected, there was no force to such a contention. The cost would, he said, be infinitesmal in comparison with the results to be achieved.

As to the changes in the system of examination and the personnel of the examining board, Mr. Sloan declared the present arrangement to be cumbersome as well as loose in its supervision of candidates. For examination of mine officials a board would be appointed consisting of the Chief Inspector of Mines and two other competent and experienced men, one to represent the operators and the other the men. Miners' certificates of competency would be issued by a board consisting of the mine inspectors of the district in which examinations were being held and two others representing the Companies and the employees respectively.

It was here that Mr. Sloan declared that it was the intention of seeing that there should be a closer supervision of those authorized to go underground. Too long had this Province been the happy hunting ground of the alien. No longer when this amendment became law would unqualified men, or men of alien birth and indifferent qualification, find it possible to engage in coal mining in British Columbia.

Explanation then was given of clauses proposing the clearer definition of the duties of a Fireboss, the fixing of a definite standard in respect of gas contents of coal mines for the withdrawal of men. By mutual agreement between the Mines Department and the Crow's Nest Pass Ry. Company, when the Coal Creek Mines were found in any place to contain 2½ per cent. or more of methane the men were withdrawn. Now it was intended that this rule should be general throughout the Province. It was a safety measure solely and was in line with the provisions of the British Act. There also were amendments which it was thought would make it obligatory on the part of practically all collieries to introduce safety lamps and which would require that cables used in the hoisting of men should be lubricated at regular intervals and should not be kept in use for a greater period than two years.

Reference was made to a change which would give the Minister of Mines power to make new rules from time to time by order-in-council. This authority, it was stated, had been given by the former British Columbia Coal Mines Regulation Act. It also was contained in the Placer and the Metalliferous Act. In Great Britain the Secretary of State had power, not only to make rules, but to amend the Act. This Mr. Sloan said he was not asking for, but he thought that the Minister of Mines should have authority to make such rules as were considered necessary for the promotion of safety in coal mining operations.

Mining Taxes in British Columbia.

In the course of his budget address before the Legislature of British Columbia Hon. John Hart, Minister of Finance, made some informative statements regarding income from taxation of the mining industry and mining property of British Columbia. He stated that the mineral tax was expected in the forthcoming year to bring in $150,000, an increase of $65,000 over the previous year's estimate. Taxation on Crown Granted Mineral Claims, he said, was expected to yield $60,000, which is $20,000 more than in the preceding twelve-month. "By bringing the coal mining companies under the alternative of income tax or mineral tax," said Mr. Hart, "which is the method of taxation applied to other mining companies, we can hope for a revenue of $200,000 instead of the $160,000." Discussing arrears of taxes the Minister of Finance pointed out that some $800,000 still remained to be paid at the end of the year on account of income tax. This, he stated, was made up largely of amount expected to be derived from mining corporations and "following an audit which has just been completed will probably be paid into the Treasury before the end of the month (March)." In reference to events of the past year affecting his department Mr. Hart mentioned the holding of a sale for arrears of taxes owing to unworked Crown granted mineral claims. He said: The total arrears represented by the property which the owners allowed to go to sale were $56,192. The receipts from the sale were $6,790, of which $140 was surplus over tax arrears and costs, and unsold parcels represented arrears and costs to the amount of $49,542. The refinements of the Taxation Act which were affected at the last session of the Legislature for the purpose of enabling us to deal with the mining and other industries in a manner which would be fair to these industries as well as to the Province have been worked out in practice by the Taxation Department and are giving satisfactory results."

Mr. F. M. Sylvester, managing director of the Granby Consolidated Mining & Smelting Company, has left on a business trip to New York. It is understood that no announcement will be made concerning resumption of work at Anyox smelter until his return.

UTILIZATION OF IRON ORES OF BRITISH COLUMBIA.

As another step in the direction of encouraging the development of the Magnetite Iron Deposits of British Columbia and the establishment of an Iron and Steel Industry, those preceding having been the offer of a bounty on pig iron produced in the Province and the obtaining of a report from Dr. Alfred Stansfield, Professor of Metallurgy, McGill University, on the commercial feasibility of treating the iron ores of the Province by means of electro-smelting, Hon. Wm. Sloan, Minister of Mines, proposes asking the British Columbia Legislature, now in session, for authority to take from any of the iron ore properties of the Province a quantity of ore, not to exceed 10,000 tons in the aggregate, for experimental uses. There are at present two small furnaces situated near Vancouver, B. C., and owned by two distinct and enterprising companies which are prepared to take advantage of the terms of this legislation.

Although it is felt that, in cases where iron properties are being held with no effort to develop them, the Government should have unconditional power to take whatever action may be deemed expedient to facilitate opening them up, thus assisting the industry which it is hoped will grow to the importance, which the country's resources warrant, it is not the intention to take the ore without recompensing the owners. The latter, it will be provided, shall be allowed 25 cents per ton free of taxation on the ore taken.

One of the companies in question is the Tudhope Electro Metals, Ltd., whose office and factory is situated at False Creek. This company have been treating scrap iron. Following interviews between Hon. Mr. Sloan and representatives of this concern, the latter reached the conclusion that, in order that a complete and satisfactory demonstration might be made as to the practicability of smelting British Columbia iron ores on a commercial basis, it might be necessary to operate a plant for an experimental period of six months, more especially if various deposits were to be drawn upon for these experiments. As an inducement to undertake this they asked of the Provincial Government 5,000 tons of ore at the rate of approximately 1000 monthly. Mr. Sloan holds the opinion that there is available an ample supply of ore of the character necessary for the production of the class of pig iron demanded by the British Columbia and foreign trade. There is no doubt in his mind that there is plenty of ore, and has been confirmed by investigations carried out since he took office as Minister of Mines. It is likely, however, that the ore to be secured most readily is that to be found on claims, either undeveloped, or very little opened up, situated on or close to tidewater. This, therefore, explains his action in asking for legislative power to secure the quantity of ore in question.

With further reference to the Tudhope Electro Metals, Ltd. It is explained that its directors, as soon as assured of a supply for their experiments, are prepared to proceed and make necessary changes in their electric furnace for the treatment of magnetite ores. They, then, would be in a position, providing the results were satisfactory, to continue production, possibly upon a much larger scale, as additional electric units can readily be added to the plant to increase capacity or to carry the operations through to finished steel. The present equipment consists of an electric furnace of 1500 K.W., with a capacity of 25 tons daily and was completed recently at a cost of $50,000. It is considered to be sufficient for the work proposed and it is thought that the demonstration outlined should result in the definite determination of the feasibility of utilizing British Columbia iron ore upon a competitive commercial basis.

The Vancouver Magnetite Iron and Steel Smelting Co., Ltd., is another company interested in the securing of iron ores for experimental purposes. It has a plant situated at Ronaldsay, Howe Sound, twenty-seven miles from the City of Vancouver. This is a blast furnace having an estimated daily productive capacity of 25 tons of pig iron. The company has been engaged in the production of pig iron from scrap iron, etc. The management of the company is anxious to try the smelting of the magnetite iron ores of British Columbia, and, with a supply for demonstration assured, is prepared to make such changes as are necessary to the plant. On this point Mr. C. Campbell-Johnston, Mining and Metallurgical Engineer, says:—

"Slightly different features to those in some other places face the iron industry of British Columbia on the coast; namely, the class of iron ores obtainable locally are magnetites; hematites do not occur along the Coast Ranges of Mountains, to flux these magnetites as is practical in other plants elsewhere. This necessity of smelting by themselves magnetite iron ores, together with fluxes of limestone and coke, calls for a much higher heat in these furnaces, namely, about 3,000 degrees Fahrenheit, to exceed well the melting point of these iron ores used. Such a degree of heat is not obtained in the ordinary blast furnace practice, but can certainly be regularly acquired by the addition, as already installed at this furnace at Ronaldsay, of ample auxiliary heat from several oil burners, to be used in conjunction with the coke, where the oil is previously warmed to 80 degrees F., and atomized under 100 lbs. pressure at least, blown into the furnace by air blast, to provide the necessary oxygen for combustion of oil, to generate a high heat, but finally leaving no free carbon atmosphere—an absolute chemical requirement to reduce the iron to metal, and combined with oxygen in the ore, to carry this same gas away."

From this it will be seen that both these companies are confident, or at least very optimistic, in regard to the practicability of treating the iron ores of British Columbia and producing merchantable pig at a cost that will permit the meeting of local and perhaps outside market requirements. They claim they have the plants necessary for satisfactory experiment, and it is Mr. Sloan's intention to do what can be done to assist them in making the attempt. If they are successful he thinks it not too extravagant to hope that, from their small beginnings, will spring industries which will exploit the iron ore resources of the Province on a larger scale and eventually lead to the establishment in the Canadian Northwest of the network of allied industries which follow the production of iron and steel on a large scale. And Mr. Sloan makes it clear that any other companies prepared to undertake such experiments in British Columbia also will be accorded every possible considerations.

In support of the efforts he is making to assist and encourage those who are disposed to enter into the utilization and the development of the Iron Ore Deposits of the Province, Mr. Sloan points to the history of the industry in Nova Scotia. From a little forge shop with a capital of $4,000 and ten employees it has developed into a great industry and one of the most notable industrial enterprises of the American Con-

tinent. In view of this experience he thought that he was justified before the members of the Legislature, and would be backed up by the country generally, in extending all assistance possible to companies which were prepared, no matter on how small a scale at the start, to demonstrate the practicability of producing high grades of pig iron from the raw material now lying undeveloped in large quantities in British Columbia.

PRESIDENT HANNA PROMISES RAILWAY TO FLIN-FLON IF SMELTER BUILT.

The Pas, Man.—Manager John Black of the Flin-Flon syndicate, and John Hammell of the original owners, with Professor R. C. Wallace and J. A. Campbell, M.P., of The Pas, formed a part of the big Western delegation that waited upon the government with reference to railway development in New Manitoba.

President Hanna, of the National railways, received the delegates at Toronto, and, after hearing their representations, he pledged to do the following railway construction:—

Flin-flon Railway—If the owners of the big ore deposit there will guarantee to erect a smelter, with a capacity of at least two thousand tons a day, the railway will be built from The Pas forthwith. The syndicate owning this ore have the matter in hand, and it is expected they will agree to the erection of the smelter. It rests upon them whether the mineral fields of New Manitoba will be opened up this year.

Melfort-The Pas Railway—President Hanna assured the delegates that this line would be partly constructed this year. Work would commence from Melfort, and up the Carrot river valley for a distance of 30 or 40 miles. Grading only would be done this year, the rails laid down next year.

The Vonda spur to Melfort will have 20 miles of steel laid this year. With the Carrot river line, this will give direct connection with the Hudson Bay railway and The Pas.

The Melfort-Saskatoon-Humboldt road from Breux to Humboldt will be completed this year. The Estevan and Souris delegates were told that a line was contemplated from west of Moose Mountain to the Hudson Bay railway.

The deputation also asked that Sturgis, on the Thunder Hill line, be connected up with the Hudson Bay railway. Assurance was given that half of this work would be done this year.

All told, six lines of railway projecting towards The Pas, to connect with the Hudson Bay railway, were favorably dealt with. Two more lines, one the Flin-Flon road, are near realization than thought possible a week ago. The C. P. R. is reported to have surveyors out, running a line west of The Pas, through the Carrot river valley towards Athapapuskow like region. These two bring the total up to eight railway lines pointing New Manitoba way.—The Pas Herald.

The drift on the tenth level of the Silversmith Mine has not run out of the ore shoot yet, according to well authenticated reports. Another carload of high-grade ore is ready for shipment to the smelter. This will be the thirteenth car moved since the resumption of operations and will bring the net smelter receipts to $75,000 or $80,000 on the 90 per cent, preliminary settlement basis. The value of the shipments has ranged from $4,000 to $7,000 on this basis. The crude ore contains about 40 per cent: lead and 90 ounces of silver to the ton.

OPPOSED TO "SALE OF SHARES ACT, 1919."

Prospectors, mining men and business men in all parts of the north have become thoroughly aroused over the "Sale of Shares Act, 1919," fearing it will be a misfortune for the Province if actually put in force. Resentment appears to be unanimous. A mass meeting is to be held in the Town Hall, Cobalt, on Monday night in an effort to arrive at some plan whereby the passing of the bill can be prevented.

Leading opinion points out the fact that the present criminal law, if enforced, would prevent misrepresentation, which after all is the food on which the wild-cat subsists. If an attempt to secure money under false pretenses is made, it is but necessary to apply the criminal law. This method would not work a hardship on legitimate enterprise.

It is contended that any individual who desires to raise money for the exploration of even the rawest prospect is entitled to do so, provided always that the property being explored is not misrepresented. The pioneer always assumes the risk of loss. At the same time he also stands the chance of enormous returns on his speculation. The stock company is an excellent medium whereby the speculating public can place funds with the chance of big returns. In this way a large number of small speculators constitute a big factor in providing funds to explore and develop mining territory. In this way the small speculator is given a chance to win a share of the success, instead of the big financial interests which are able to operate without forming stock companies.

Prospecting in Manitoba.

Active claim staking is going on throughout The Pas mineral belt. About thirty were recorded during the month just closed. Mr. John Forbes, T. R. Edwards and G. B. Hall were active between Mile 191 and Mile 195 along the H. B. Ry., and they accounted for the majority of claims registered. They acted for the North Canada Exploration Co., Ltd. Dr. Robertson's party were active around Big Island. J. B. Moors got several claims at Cranberry lake. F. G. Moore and Joseph Moran staked three on the south shore of Clearwater lake. Thomas Riddoch got one at Mile 195. Bob Hassett and Deakin Hall recorded several located on the east arm of Athapapkuskow. As far as The Herald is able to ascertain, there will be three large exploration parties in the field this summer. They are the Longyear, Paull and Chica.—The Pas Herald.

Dome Mines.

General Manager C. D. Keading has returned to the Dome Mines at Porcupine, and former mill superintendent Dowset is expected within the next week or so. The work of installing the large underground crusher at the 800 foot level of the property is being proceeded with, and it is expected about a month will be required to complete its installation. This will consistitute one of the concluding steps in the big scheme which aims to place the mine on a producing basis larger than ever before in its history, greatly facilitating the handling of the ore and reducing the costs of operation. All this tends to strengthen reports to the effect that operation of the Dominion Mines at full blast is only a matter of a few weeks.

Work of National Production Committee U.S. Fuel Administration

By JAMES B. NEALE.*

(A paper presented at New York Meeting, American Institute of Mining Engineers, February, 1919.)

From the beginning of its activities, the members of the national Production Committee have felt that the following points were essential to the success of its work: The operators must feel that their operations were not 100 per cent efficient; that they should be courteous and fair in their treatment of their employees; and that they should set an example of hard work and patriotic interest in increased production.

Every move made must appeal to the sense of fairness of all parties concerned.

The men must feel that in working more faithfully, and consequently producing more coal, they are rendering a distinct service to their Government in the time of its great need. As the workers feel that greater efficiency on their part results only in greater profits to the operators, the advantage to the operator should be lost sight of, as far as possible, and the advantage to the Government in fighting the war emphasized.

Both operators and workers should know that the Government considered increased production an obligation, and opportunity for service, resting on both parties and not on the operators or the workers alone, and that both parties could very much better the efficiency of the pre-war period. Had the committee intimated that it thought the coal shortage was due entirely to the idleness and inefficiency of the workers, its campaign would have failed, for the men would have resented the charge because only too frequently their efforts to produce more coal were thwarted by bad management; besides the operators would have lacked stimulus to better effort. On the other hand, had the impression been given that the committee thought that the coal shortage was due entirely to bad management, the operators would have resented the charge because only too frequently their efforts to produce more coal were thwarted by the idleness and inefficiency of the workers; and the workers, having been thus indirectly pronounced 100 per cent efficient and patriotic, would have lacked stimulus to better effort.

Method Adopted for Increasing Production.

With these points in mind, the committee devised the following plan: A production manager was chosen for each of the twenty-eight large producing districts. For the most part these managers were nominated by the operators in each district and they became the centres of the production activities. At a large percentage of the mines, production committees were formed, one at each mine. These committees consisted of six men—of whom three were appointed by the management and three were chosen by the workers—and worked under the direction of the production manager, who served as the umpire in case of division in the committee. The members of these committees were given certificates of appointment and badges and every effort was made to have them feel that their position was one of dignity and responsibility; that they represented the Government and were fortunate in having an opportunity to render special service to the Government during the war. Their duties were carefully defined in a letter which was broadly circulated. In the main these duties consisted in discussing ways to better the efficiency of the mine and its equipment, and of the mine workers.

The members of the National Production Committee, in Washington, made every effort to protect mine labor from undue inroads by the selective draft, voluntary enlistment, munition plants, and other war activities. They looked carefully after the needs of the operators as to mine supplies and obtained proper priorities for such materials. They dealt with the railroads in reference to car supply and rendered valuable assistance to power plants selling electricity to the mines. Soldiers who had seen active service and could bring home to the workers the life in the trenches and their relation to it visited hundreds of mining camps and addressed the workmen. A great amount of material, such as posters, poems, etc., that it was thought would appeal to the men and arouse their patriotism, was distributed and personal letters were written to workers who made unusual records.

In many districts, the production managers established the daily tonnage necessary from each mine and had the local production committee accept it as the Government's requirements. This was one of the most stimulating features as it gave the men at the mine a definite goal and they felt that the standard was set by the Government and not by the operator, so the unwilingness to work hard for the operator's benefit was more or less lost. The net result was a very large increase in production.

During the five very active months the National Production Committee spent in Washington, the members came in close contact with hundreds of operators, miners' leaders, and mine workers. All were keenly interested in increased production and frankly expressed their views as to the causes that impeded production and as to the steps that should be taken to increase it. We discussed what we called methods for increased production, but which were really methods of increasing the harmony and co-operation between employer and employee, which is the true basis on which increased production must be built.

Need a Stimulating Ambition in Workmen.

There is undoubtedly throughout the world, as is evidenced by the rise and spread of Bolshevism, a feeling that the good things have not been evenly divided; that some persons have had too much and many others too little. This is true in theory but it is difficult of correction. Doubtless the unequal distribution of wealth is due to the unequal distribution of worth, and until worth is equally distributed there can be no permanent equal distribution of wealth. It

*Director of Production, U. S. Fuel Administration.

seems essential, therefore, to make an earnest persistent effort to emphasize the need of worth and to do everything possible to stimulate it. The Bolsheviki are trying to distribute wealth on the basis of might and disaster can be the only result of the effort. Is not the promotion of worth the proper counter-irritant to Bolshevism?

We, operators, as the pace-setters in the coal industry, must do our part. Our workmen must be, much more than ever, a matter of deep concern to us. We must plan well and unselfishly for their general well being and must use every effort to stimulate them to greater efficiency as to labor and to higher ideals as to the proper use of their lives. There must be created an ambition for more comfortable homes, and better food and clothing for themselves, their wives, and their children. The education of their children also must become one of their main desires. Now, their dominating desire is more leisure; fewer hours at work is their goal and increased wages help them to attain it but at the expense of production. This ambition is disadvantageous both to the men and to the operators and the only way to relieve the conditions it produces is by creating new ambitions and aims. A man who needs $30 a week to live in his accustomed manner and who can earn $5 per day, will work six days a week. If his earning power is increased to $7.50 a day, he can earn the $30 a week necessary by working only four days, so there will be a tendency on his part to decrease his working days from six to four. This is uneconomical for all parties. By stimulating in the man higher aims and ideals, which will require more money for their satisfying, will not only increase his desire to work but will also tend to change his work into service. These aims and ideals will make him feel that his work is not merely dull toil but that it is an honorable means of enabling him to gratify his higher ambitions. The war has paved the way for this work on the part of the operators, for during the past 18 months, as never before, the work of the American workmen has been service in a great cause and now that the thought of work being service is in their minds, every effort should be made to intensify the thought and make it permanent. Surely war conditions cannot be a greater stimulant along this line than can peace conditions.

It is the duty of some one to promptly take this whole matter in hand; and if it is the duty of someone, surely that someone is the employer. He is the one who, by birth, environment, or some special virtue, is the one to whom this should appeal and he is the one best equipped for the leadership. The average workman is not just as we would want him to be, but that is no fault of his. He is the product of his opportunity. If we want him to be better, we must make for him a better opportunity. We get nowhere by complaining or by destructive criticism, but we can accomplish much by putting our shoulders under the wheel and lifting with a true desire to help for unselfish reasons.

If we are to assume this leadership we must first make firm our standing with the men along industrial lines. As yet the men do not feel that we actually owe them anything along the lines mentioned, but they do feel that we have certain industrial obligations. These we must meet and satisfy the men that we are fair employers before we can expect to exert an influence along higher lines. The men now look upon us with suspicion. They feel that we are their enemies, that their best interests conflict with our best interests, and that we constantly try to take advantage of them. In days gone by, and to some extent today, many employers do try to take advantage of their workmen in an unfair way, so that the workmen are suspicious of all employers.

Industrial Obligations of Employers to Men.

The men feel that there are two industrial obligations on the part of the employer toward them: The first one is that the wages and working conditions, as defined in the scale contracts, must be met. We employers acknowledge this obligation, which is virtually a legal obligation and cannot be shaken off. individual failures. Nevertheless, if deposits so valuable pass into private ownership, there is nothing unreasonable in regarding them as charged with a lien in the form of a demand that a fair share of the profits derived from working them shall inure to the public benefit.

Twenty-five years have seen a great change along this line. Not only do the operators for the most part make an honest effort to abide by the scale agreements but they have set up courts of arbitration so that disputes under the agreements may be adjudicated by an impartial tribunal. The one fly left in the ointment, in this regard, is that very many men feel that the operator bitterly resents being taken before the board and that he will seek revenge against the man who brings the complaint. This feeling does away with much of the real virtue of arbitration. Every operator should make the men feel perfectly free to discuss their grievances with him and, failing to agree, to refer the matter to the board without any prejudice against the workman in days to come. If the operator is conducting his business fairly, he need have no fear of having his work reviewed by an impartial board.

The second industrial obligation that the employee feels should rest on the employer is that of making it possible for the employee to do a day's work when he reports for duty. This obligation the employer has not formally recognized in any way and it is the next step to be taken. We have recognized the first obligation and are very much better off for having done so. We must now formally recognize the second obligation and will be very much better off for doing that also. A new board should be set up or else the powers of the existing board should be broadened so that judgment may be passed as to whether or not the employer has failed in his duty of providing an opportunity to do a day's work. Before this board will come up questions as to whether or not the operator is to blame before a man is passed out, because his place contains water, because there is no timber or cars, and various other obstructions to good working conditions. A man feeling aggrieved along this line should be encouraged to bring the matter to the attention of the board for the effect of having fair judgment passed would be available. No mine foreman want to have an impartial board say that he is conducting the affairs in his mine in an inefficient way, so the very existence of such a board would be a tremendous stimulant to the mine management.

The board, also, should decide whether or not a workman failed in his duty by being absent from his work. There is just as much of a moral obligation on the employee to work, unless prevented by unavoidable causes, when there is an opportunity to do a day's work, as there is on the employer to furnish the opportunity. No good can result if the obligation is placed only on the employer. Both parties interested must share it. With these two obligations

acknowledged, with means provided for adjudicating differences of opinion regarding them, and with the men feeling that they are welcome to bring their complaints, we will have our industrial skirts clean and the decks cleared for active leadership along lines looking toward higher ideals and better manhood.

Obtaining an Equal Distribution of Worth.

We all know the main influences that can be made powerful factors toward a more equal distribution of worth. We must be keenly interested in the home, the school, the church, and all social activities, in fact, in everything going on in the community that has an influence on the lives of the people. Until now our thoughts have centered on material things, on mechanical devices, and along these lines we have made great progress; but we have paid little attention to the social, physical, and moral betterment of our employees. For the most part we have not tried to see that the boys entering our employ each year were better than the boys who entered the year before. We have given little thought to our workmen, excepting as workmen, and even then we have made no effort to teach them what we should. We have complained bitterly of their actions many times and yet have done little or nothing to better their environment and opportunity and to stimulate higher ambitions and ideals. We have engaged a young man as a fireboss, or a pitboss, and have said to ourselves "That young fellow is a comer. I'll make a real man of him." We should consider each one of our workmen a comer and try to make a man of him. All of this may sound theoretical and impracticable but it is not. It cannot be done in a day or in a year, but it can and must be done if the good things of this world are to be gradually and fairly divided on the basis of worth, and are not to be suddenly and unfairly divided on the basis of might. We, operators, are face to face with a condition that is exceedingly important and serious, and I believe we are strong enough to meet it in the proper way.

During the past eighteen months the President of the United States, in his various addresses and messages, has set up a very high standard. He has given to the world high ideals and every effort must be made to live up to them. The great mass of the people feel, in a hazy way perhaps, that peace is going to bring to the world better conditions; that there will be a more equal division of this world's goods; and that brotherhood will become much more a fact than before. It will be a keen and dangerous disappointment if the President's ideals do not prevail in large measure.

ENCOURAGING PROSPECTORS IN BRITISH COLUMBIA.

That the sum of $207,523 has been expended by the Provincial Government on aiding in the construction of roads, trails and bridges to mineral claims in British Columbia since the accession to power of the present Administration late in the year 1916 was announced in the British Columbia Legislature the other day by the Hon. Wm. Sloan, Minister of Mines. He explained that originally the vote for this purpose was $200,000, which sum had been supplemented during the session of 1918-19 by $75,000.

It is pointed out, in this connection, that the Government has adhered to its policy of encouraging the development of promising mineral deposits by assisting in the provision of transportation facilities ever since it was returned to office by the country. Since January 1st, 1917, there have been built ninety-eighth and seven-eighths miles of mining roads; seventy-five and five-sixths miles of mining trails; and there have been repaired 437¼ miles of mining roads and 420¼ miles of mining trails. These roads and trails, it is explained, all were of such a character as to be of service, almost solely, to mines in the first stages of development, or claims on which work was proposed, and which were sufficiently encouraging in their prospects to warrant the expendtiures. Under the terms of the "Mineral Survey & Development Act," which provides the Government power to extend the help indicated, the Government mining engineers, on receiving applications for aid in the building of roads or trails, must visit the district or the property it is intended to open up and make a report on the same. If their reports are favorable, showing that in their opinion the claims to be assisted are worthy of the same, the Minister of Mines may authorize the expenditure of 50 per cent. of the estimated cost.

Details of the expenditure along these lines during 1917 and 1918 are as follows:

"1. Total expenditure, $207,523.34.

"2. Alberni; Marble Cove Group, Copper Island, $500; Columbia Mines, Sproat Lake, $500; Canadian Mineral Claims, $500; Victoria Group of Mineral Claims, $200; Great Central Lake to Big Interior, $200; Monitor Group Trail, $500; Black Prince No. 2 Trail and bridge, $225.

'Atlin: Esperanza Group, Alice, Arm, $367; Bush Mines, Salmon Bear River Co., $5,000; Salmon River Wagon-road, $7,500; Georgia River Trail, $1,500; George Copper Mines, $500; Grey Copper Group, Bear River, $150; La Rose Mine Trail, $600; Maid of Erin Group, Rainy Hollow, $635.50.

"Cariboo: Proserpine Mount Mines, $500; Killam Cement Gravel Mines, $1,032.15; Upper Horsefly Road, $1,569.

"Columbia: Bugaboo Trail, $75; Brisco No. 3 Creek, $91.33; Boulder Creek to Siting Bull, $1.130; Boulder Creek to Relief Mines, $150; Boulder Creek to Pretty Girl Mine, $150; Brisco to Lead Queen, No. 3 Creek, $1,200; Canyon Creek Trail, $55; Canyon Creek Trail to 15-Mile Creek, $225; Giant Mine Road, $8.50; Horse Thief Creek to Mabel Road, $200; Horse Thief Road to Gallop Mines, $98; Paradise Mine Road, $109; Paradise Mine Bridges, $700; Spilimacheen Road to Warren Creek, $225; Tennessee and Tarheel Mines, $100; Toby Creek Cut-off, $11.500: Toby Creek Road, $422.-01; Toby Road above 11-Mile, $600; I.XL. Condor Mines, $30; Four-foot Trail above 11-Mile Post, Toby Creek, $500; Trojan Copper Mines Sleigh Road, $4,000; Carbonate Spruce Camp Bridge, $300; Carbonate Spruce Camp Trail, $200; Lead Queen Sleigh Road, Francis Creek, $1,050; Bugaboo Creek Trail (Mercier's), $50; Fred Ball's Trail, Mineral Creek, $250; Gallop's Claim, Horse Thief Creek, $298.

"Comox: Valdes Island Copper Mines, $3,000; Vanbert and Ophir Mines, $250; Blue Bell Mine Trail, $50.

"Cowichan: Blue Grouse Mines, $1,023.50; Jubilee Mines to Cowie Mineral Claims, $270.08; Robertson Silver Mines, $475.

"Cranbrook: Dibble Mine Trail, Fort Steele, $75; Society Girl Mine, $50; North Star Mine, $150.

"Dewdney: Molybdenum Stave River Pack Trail.

"Esquimalt: Section 93. East Sooke, $4,625; Leach River Trail, $300; Sunloch Mines, Jordan River, $7,500: McDonald Creek Bridge, $200; Sooke Lake, Leach and Phillips, $265.

"Fernie: Burton Mine, Elko, $1,000.

Grand Forks: Paulson-Christina Lake, $2,500; sig Claim, Norway Mountain, $200; Paulson-Molly son Mine, $150; Galloping Mountain Trail, $2,600; k Candy Group, $3,000; Gloucester Group, Maple f Claim, $1,200.

Greenwood: Big Copper and King Solomon Mines il to First Chance, Jim Hill, and St. Paul Mines; Galloping Mountain, Grand Forks), $200; B. C. e to Junction, $150; Providence Mine Road, $100; erprise Mine Road, $100; Standard Fraction Claims,); Castor Franction Claims, $101.37.

Kamloops: Dunn Creek, Windpass Group, $300; ia Group, Canyon Creek, $800; Copper King and eod Group, Seymour Road, $3,000; Seymour River ge, $1,000.

Kaslo: Cork Mine, South Fork Road, $2,500; Circle , Elsmere Group, $500; Levina-Butte Trail, $200; vser-Argenta Road, $2,500; Cultus Creek $1,500; n and Crescent Mines, Coffee Creek, $2,500; Jack- 's Wagon-road, $2,000; Bayonne Camp, Sheep ek, $100; Bannockburn Camp, Hall Creek, $900; coln Group, Spring Creek, $100; Ainsworth Road, 00; Tenderfoot Bridge (Porter), $750.

Lillooet: Sucker's Hill, Bridge River Road, $1,000; tier Line, Texas Creek, $125; Gun Creek to Copper untain, $2,500; Timothy Mountain Trail, $300; lath Siding, Bridge River, $362.50.

North Vancouver: Bowen Mines, Dorman's Ranch, 0; Indian River Trail Bridges, $3,000; Squamish- amit Trail, $100; Sun Group Trail, $1,554.37; Mam- m River Trail, $255; Tonquillo Creek Trail, $1,000.

Newcastle: Majuba Trail and Sutton Trail, $400.

Omineca: Road to Babine Bonanza Mining & Mill- Company, $150 and $15,674; Dockrill Road, Howi- Creek Mines, $21,600; Delta Copper Mines, $750; dson Bay Mountain Coronado Group, $200; Nine-mile Mountain Road, $2,500; Ashman's Coal Property Road, $500; Quartz Creek Trail, $250; Hudson Bay Mountain Sleigh Road, $4,000; Shaefer, Wood, Anderson Claim, $500.

"Prince Rupert: Drum Lummon Mines, $1,250; Pacific International Copper Company's Trail, $1,500; Tuttle's Account, Legate Creek, $500; Golden Wonder Mine, $125; Chindemash River Pack Trail, $100.

"Revelstoke: North Road Big Bend Trail, $17,000; Woolsey Group, Silver Creek, $2,300; Fish Creek Trail (Stuart), $150; Mastodon Mine Trail, $1,500; Mountain Chief Mine, $750.

"Rossland: Burlington and Anaconda Mines, $1,000.

"Similkameen: Red Star Mineral Claims, $100; Oregon Group Trail, Hedley, $250; Princeton-Copper Mountain, $1,000; Summit Camp Trail, $200; Coalmont to Tulameen, Granite Creek, $350; Tulameen River Bridge, $500; Pack Bridge, Champion Creek, $550; Treasure Mountain Group Trail, $50.

"Slocan: Carnation Mine Trail, $300; Echo Mine Road, $2,434; Silverton-Four-mile Road, $1,500; Elkhorn Mine Railway Siding, Sandon, $1,000; Ten-mile Creek Road, $500; Springer Creek Road, $500; Millie Mack Trail, $450; Sand Creek, Lighting Peak Trail, $107.25; Sovereign Mine Road, $483.48; Arlington Mine Road, $200; Victor No. 6 Mineral Claim, near Sandon, $80.

"Trail: Gordon Group Trail, $187; Headland Trail, $153.70; Lost Creek Trail, $520.95; Wild Horse, $100; Ore Hill Road to Sheep Creek, $450; Reno Trail, Downey Brook Group, $500; Eureka Mine Road, $525; Noonday Group Trail, $375; 49-creek Road, Gold Hill Group, $200; Aspen Mine Trail, Deer Creek, $350; Hall Creek to Copper Mountain, $100; Southern Bell Mine Trail, $200; May and Jennie Mill, $50.

Industry Must Bear the Cost of the War*

By D. B. DOWLING.

We rejoice that we are able to welcome many who e returned from the scenes of their brilliant ex- its on the western battle front and to have the urance that soon the remainder will be coming ne. It is gratifying to know that our engineers e demonstrated their heroism, tenacity, skill and lity to construct military works or to take part in rations which showed their great adaptability and tiative. We rejoice also to know that the fire of riotism burns as hotly in the breasts of the mining gineers and miners as in any class, and that their h to participate was only checked by the absolute d of the nation for their services to help provide l and material for munitions.

With the present meeting the Canadian Mining In- ute attains its majority. The event occurs at a mentous period in the history of Canada. We have npleted a campaign in which Canada has shown virility as a belligerent nation. She has now to w her ability to recuperate under very trying con- ions and for the first time without help outside her own resources. As a new nation in the British Empire, our cousins and neighbors have shown that we are accepted in their affections in a somewhat more intimate association, a relationship which may be likened more to that of brotherhood. The Joint Meeting of the American Institute of Mining Engineers with the Canadian Mining Institute, held in New York in February, has shown the close bond of sympathy that exists and we are glad in turn to welcome them at our meeting and with them rejoice at the successful termination of the war.

We meet together to celebrate the coming of age of the Institute. From small beginnings it has grown to be representative of the mining engineers and the mining skill of Canada. Our doors are opened wide to those whose study or experience makes them an asset to Canada in the working out of the problems that are to be met with in the proper utilization of mineral resources. As an Institute we have reached our majority at a time when our responsibilities have greatly increased over pre-war conditions.

As a people we have a debt to pay and we must realize that **it must be by industry.** The proper utilization of labor, to gain the maximum return for the nation,

*Presidential address, Montreal Meeting Canadian ning Institute, March 5, 1919.

must be the great problem of the future. **Our self-evident fact that seems to be worth our earnest consideration is that unskilled labor produces the smallest return. To make us efficient, technical education in all lines should have a prominent place.**

To many of the nations of the old world the scope of labor is restricted; to some the production of food and clothing is the main avenue; to others the possession of fuel has opened the way to manufacturing; while some of the small states depend on the production of the various raw materials. The depletion of national assets is greatest when the production consists of mineral materials alone, less where manufacturing is the main industry, and least where the products of the soil are the commercial assets.

The depletion of national resources is one of the serious problems facing the nations of Europe and is the cause of much of the insecurity felt by the smaller powers. The large organized powers have cast covetous eyes on the mineral riches of their weaker neighbors—the plea for a place in the sun advanced by Germany being merely an excuse to rob her neighbors, since the outer world seemed pre-empted. The close of the war renews the economic strife to maintain manufacturing supremacy, and with it the attempt to conserve raw materials within and for each nation. Those not favored by trade and manufacturing advantages will find large outside markets for their resources. This opportunity will be offered to Canada, but if we are to build up a self-sustaining country our known ability to provide foodstuff for a very much larger population should be taken advantage of along with our natural power resources to foster many other industries.

We are happily situated. We do not find ourselves restricted as to our agricultural products, and happily for us the revenue derived from the products of agriculture forms a large addition to our income without a corresponding depletion of our assets. For manufacturing we have large sources of power from fuel and waterfall. The natural power is one of our greatest assets and its utilization like the production of food is not a charge against our resources.

Our highest aims economically should therefore be to develop our basic industries, notably agriculture and mining and also our manufacturing, which in turn will provide our own markets for raw materials. Following our arguments, the manufacture of foreign raw materials may be of advantage, as has been found in England, but we must remember that very soon the purchase of foreign unmanufactured articles will become increasingly more difficult so that without a domestic supply there will be a restriction of activity and there would probably set in a tide of emigration to other centres of population.

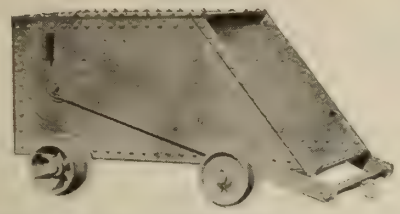
Our mining interests will always have markets for their products, but it seems desirable that these products be utilized at home. Many of our resources of the less precious materials have been neglected and Canada has spent vast amounts to keep foreign labor employed, when the materials could be fabricated at home.

The return of the army has been considered as a labor problem and the attention of private and governmental committees will be centered upon placing this body of men at remunerative work as quickly as possible. This may artificially stimulate the manufacturing industry, but to maintain the economic equilibrium agriculture and mining must also be fostered. To keep up the supply of raw materials for the many industrials in existence and to provide material for other possible ones will be a national obligation. The responsibility lies very heavily on the members of the Canadian Mining Institute; on the mining engineer to economically and safely recover the mineral riches; on the prospector to test and examine our prospective ore bearing areas; and on the explorer and geologist to examine the larger regions and show the way by maps and reports to the additional possible areas or to call attention to new minerals and their possible use in the arts or manufactures.

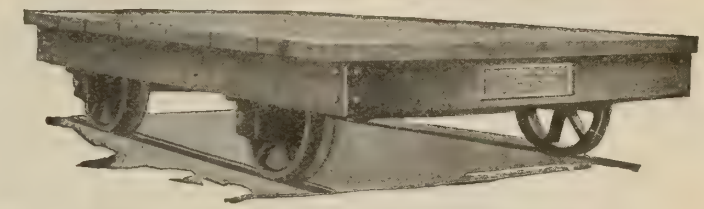
We know that our public men are alive to the needs of the country during the constructive period; but they require the help of everyone in forwarding their projects. To encourage prospecting when mineral prices fall is no easy matter. Help may come from an unconsidered source. The chemical industry or the metallurgical industry may send out the call for material that the prospector may readily find. The various governments are no doubt considering possible schemes for the encouragement of prospecting¼ but the burden of a general exploration of the country has long been on the Federal Government and very much of the success of this work must be credited to the Geological Survey. During the war many of the staff have been employed overseas, and the efforts of the rest turned to work, more or less directly connected with the supply of munitions. Now, with their return, an enlarged programme is being arranged and this is facilitated by the fact that the Minister of Mines is fully alive to the need of the many interests.

In closing it is with a great deal of pleasure that your President can assure the Institute that the publications of the Department of Mines will in future be facilitated by the personal attention of the Minister of Mines, the Honorable Martin Burrell.

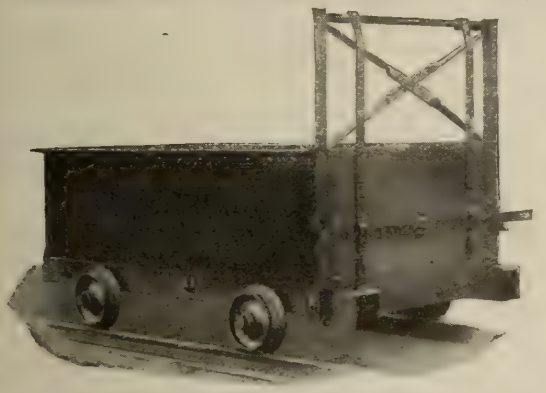
SMALL CARS—Any type or design you want, and built the way you want them built.



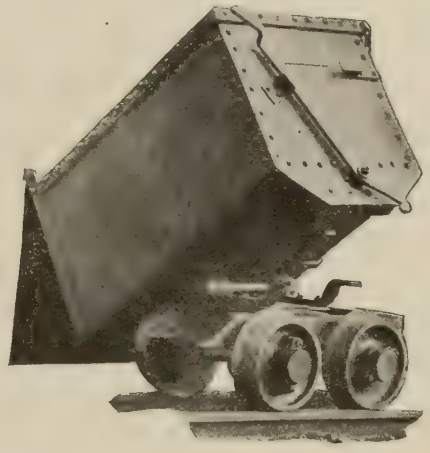
STEEL SKIPS. For use on Mine Tipple, made any size to suit your work, and if desired, with double bottom, and rivets countersunk and flush on the inside, to facilitate easy dumping.



PUSH CARS. Made any required size and strength to suit the work.



END DUMP CAR. With dust-proof, self-oiling bearings. This is only one of our many types of End Dump Cars.



ROTARY MINE CARS. Roller Bearings, dust-proof, easy running. Will dump at either side or end. Made in a large range of sizes and capacities.

Send for Catalogue showing our other styles of cars.

Shipments to Trail Still Large.

Considering the unsettled state of the metal market since the armistice, and the total lack of market of any kind for lead and copper, and practically the same condition affecting spelter, the showing of ore shipments to the Trail Smeltery for the first two months of 1919 is very satisfactory, 65,733 tons of ore and concentrates having been received in that time. This is even more than it was over the same period of 1919 when the total was 61,393 tons. A year ago, however, Trail was just recovering from the smeltermen's strike of five weeks, so that the 1919 total for the first two months may more properly be compared with the first two months of 1917, when ore shipments reached 77,537 tons. There were then no ripples on the horizon so far as the metal market is concerned and the war demand from overseas was most insistent.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous o investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scoti by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practicall at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grad manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold field of the province cover an area approximately 3,500 square miles. The gold is free milling an is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, a situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application t

HON. E. H. ARMSTRONG, - HALIFAX, N.S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gol Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the mine agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate give right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $5 an acre for SUPERIOR METALS, and $3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

EDITORIAL

EDITORIAL NOTES

The British Columbia Chamber of Mines will not allow the hold they have secured by the success of this Convention to slip. They will continue a publicity in B. C. on the plane which it deserves.

Many mining men who have followed their calling for years were most forcibly impressed by the minerals displayed and the figures shown by the different engineers of the Provincial Government. These reports impressed them with the great possibilities of British Columbia.

The Convention was successful from every point of view and demonstrates what the get-together spirit will do when applied properly and British Columbia must not let the results of this Convention stop at this. The chance is here to drive home the publicity campaign which is already started and which will bring results of untol value to the Provinces, if properly followed up.

Mr. Rickard's address is well worth perusing and will give the investor something worth while to consider. British Columbia wishes investors to look at the mining possibilities in British Columbia from Mr. Rickard's point of view and the results of any investments made by them in B. C. properties should certainly be worth while if they follow the precepts as laid down in this address.

When mining men from Grand Forks, B.C., are registered at the Convention in Vancouver as delegates from the Northwest Mining Association of Spokane, Wn., bringing credentials from that Association, it surely shows that British Columbia has not looked after her interests properly. It also shows how other places have used the opportunity to turn out and keep in touch with the mining fraternity at every chance.

The response to the invitation from the British Columbia Chamber of Mines to the members of the mining fraternity to attend the first Annual International Mining Convention at Vancouver on March 17, 18, 19, far exceeded expectations. The result has been one of the greatest mining conventions ever held on this continent. The British Columbia Chamber of Mines certainly appreciates the response made to their invitation. From the results of this Convention the British Columbia mining industry has received an impatus which, without doubt, will carry it far as regards future results.

DEVELOPMENT OF MINERAL DEPOSITS IS A BUSINESS FOR THE VENTURESOME

One of the best things of the Vancouver Convention was the address by Mr. T. A. Rickard on "Mining: An Investment, A Speculation, or a Gamble?" We reproduce it on another page. We commend it to the attention of those who would attempt by legislation to remove the risk from investment in mining enterprises. Those who would heavily tax the mining industry may also read it with profit. More particularly we would call it to the attention of all who put their money in mining ventures. Such addresses will help to keep the very timid out of the industry and will at the same time attract the venturesome. Mining is a hazardous business as well as a hazardous occupation for the workers. It is a business for the strong, not for the weak. It is a business for the venturesome, not for those who are unwilling to run big risks.

There are fortunately in Canada many well established mining companies, employing large numbers of men and doing a profitable business. The big operating mines are the backbone of the industry, a great national asset. But to many of us the history of a property from the time of its discovery until it becomes a producing mine is much more interesting than its later history. Mines that are, are not so often in our minds as mines that may be.

We can sometime spredict from surface examination what the results of development work in a new area may be. But such predictions are at best, a mere approximation to the truth. To obtain more information it becomes necessary to spend money, sometimes large amounts, in development work. It is well that those who provide the money should understand they run big risks.

We belive that there are plenty of people willing and able to risk money in developing mineral deposits, so long as there remains the possibility of some being richly rewarded. In Canada we have splendid opportunities for such adventurers. They should be encouraged by honest treatment, not discouraged by unfilled promises of certainty of success.

ROYALTIES UNDER DOMINION LAWS.

Until recently, the regulations affecting minerals occurring in quartz on many Dominion Lands have not been subjected to serious scrutiny. During the last few years, however, in which considerable interest has been taken in gold and copper properties in Manitoba, criticism has necessarily been somewhat more pointed. The change from a freehold system to a leasehold system, and the fact that that change was made by Order in Council, stirred the interest of all who were seriously concerned with the future of mining developments in this district. It is noteworthy that no action has yet been taken on this matter by any organization without the boundaries of Manitoba. More recently, however, it has been realized that another situation connected with the regulation for the disposal of quartz mining claims demands attention. In Clause 94 of the Regulations it is stated that "The lease of a mineral claim shall reserve to the Crown such royalty on the sales of the products of the location described in such lease as may from time to time be fixed by Order in Council —the royalty to be collected in such a manner as may be prescribed by the Minister."

The developments in Northern Manitoba have now reached the stage where exploring companies of standing are willing to invest considerable capital in preliminary development work. It is necessary, however, for such companies to look ahead to the period of production, and to the probable action of the State in exacting taxation. While it may be freely admitted that the subject bristles with difficulty, and while it cannot be reasonably expected that an absolutely clear cut policy be laid down in the Regulations, it is none the less clear that the clause above quoted is so lacking in definiteness and concreteness as to be objectionable to the investor. There have been several instances of companies, desirous of carrying on exploratory work in this territory, who object in no uncertain terms to the vagueness of the above quoted regulations. On another page will be found the text of the resolution passed by the Manitoba Branch of the Canadian Mining Institute on this matter. As in mining laws generally, so in taxation, the experience of the Provinces is wide and varied; and a discussion on the regulations adopted by the Department of the Interior would doubtless be illuminating.

A SUGGESTION.

"Why could not mining flotations be put under the jurisdiction of the Bureau of Mines?" Such is a suggestion now being made by some of the most conservative mining men in the business.

Why couldn't they? There appears to be no reason why they could not and should not be. The Bureau of Mines, through the Mining Commissioner, and through Mining Recorders in each mining division, is in a position to benefit from the advantage of opinion in the mining fields. By adding to its already competent staff of geologists, which staff would have authority to enter any mine at any time and report to the government, the Bureau of Mines could readily recognize false or misleading literature circulated for the purpose of selling stock. In other lines of business punishment is handed out to those who get money under false pretences. Why not enforce similar measures in the business of mining? Such a plan would quickly eliminate the wildcat. Incidentally, it would give added impetus to honest mining.—J. McR.

MANITOBA BRANCH OF CANADIAN MINING INSTITUTE.

A meeting of the Manitoba Branch of the Canadian Mining Institute was held at The Pas on March 17th, at a time when the town was en fete by reason of the Hudson Bay Dog Derby, which was the season's event in the Northland. It was decided to make this an open meeting, and there was a very large attendance in the Assembly Hall of the Community Building. Two papers were presented to the meeting.

Mr. G. R. Bancroft discussed "The History and Possibilities of Prospecting in Northern Manitoba." The author dealt with the earliest period of prospecting in the copper and gold areas, in which he had taken a considerable part. He went on to deal with the present situation, and took up in detail the features of the various districts where discoveries had been made within the last two years, the nature of the surface indications, and the general economic possibility.

Mr. H. C. Carlisle gave a paper on the Mandy Mine. Mr. Carlisle, who has been manager of the mine for the last two and a half years, discussed somewhat fully the mineralogy of the orebody, the folding and faulting systems, and there relationship to the high grade copper sulphide lens and the low grade general orebody. He dealt with methods of operations that have been adopted in excavating the high grade lens and discussed the economic situation with reference to the mixed copper, zinc, and iron sulphides blocked out in the mine.

A general discussion ensued, and several matters relative to developments in the district were taken up. The question of royalty regulations applicable to quartz properties was taken up, and a committee consisting of Messrs. Bancroft, Bunting and Vickers was appointed to draw up a resolution. The following resolution was then unanimously adopted:

"Whereas in the regulations for the disposal of Quartz Mining Claims approved by Order in Council dated May 25th, 1917, it is laid down in Section 94 that such royalty may be reserved to the Crown on the sale of the products of leased claims, as may from time to time be fixed by Order in Council;

"And whereas in the experience of those interested in furthering the development of mining in Manitoba it has been found that the terms respecting the matter of fixing royalties on leased properties are so indefinite that financiers hesitate to support exploration enterprises until a more concrete plan of charging royalties is outlined:

"Therefore be it resolved that the Manitoba Branch of the Canadian Mining Institute assembled in session at The Pas unanimously request the Council oft he Canadian Mining Institute to present the situation outlined above to the Minister of the Interior, and to recommend that the section referring to royalty be so amended as to give as clear an idea as may be of the plan which the Government intend to adopt in charging royalties on operating mines; and further to indicate whether it is the policy of the Government to permit mining companies to operate for a certain period of years before royalties are charged on their properties."

The chairman of the meeting was Mr. R. C. Wallace, President of the Manitoba Branch.

The Vancouver Mining Convention

March 17, 18 and 19, 1919.

With representative mining men in attendance from as far south as California, and as far north as the Yukon and with every intervening mineral section represented by leading mining men, the first International Mining Convention ever held in the City of Vancouver opened on Monday, March 17, and closed on Wednesday the 19th. The Convention in every way was a success. Its first feature was a stirring address by the Honorable William Sloan, Minister of Mines, and its closing incident was the ringing appeal of M. J. Carrigan, of Seattle, Washington, to all interested in the promotion of the industrial welfare of the Pacific North-West to unite in a determined effort for the establishment of an iron and steel industry either on the Canadian or American side, or both. Mr. Carrigan dwelt on the fact that Mr. Sloan had been the first man in public office to declare in unqualified terms that British Columbia possesses iron ore in sufficient quantity and of such quality to permit the opening and permanent continuance of a furnace modest in size in this province. He congratulated the Minister of Mines on the courage of his statement, and the vision which it indicated. He stated that he had known this to be a fact for fifteen years, but that Mr. Sloan had been the first man in a responsible position to publicly make the announcement. Reference was made also to the very great importance of such an industry, if the shipbuilding of the Pacific Northwest, the foundations of which have been laid through the exigencies of the war, is to be perpetuated.

Addresses.

There were many notable addresses during the Convention, but before referring to them, the British Columbia Chamber of Mines should be congratulated on the splendid judgment exercised in the preparation of its programme and in the satisfactory manner in which it was carried out. Vancouver is not essentially a mining town, but on this occasion, if the very large crowds which thronged the Vancouver Hotel is any criterion, a large proportion of the leading merchants, business men and citizens generally turned out, both to welcome their visitors and to acquire information as to the mining possibilities and the future of mining in their Province and in the countries adjacent. Certainly they gave the delegates from outside points a warm welcome and treated them with every hospitality and consideration. Reverting to the addresses, it is fitting that brief introductory reference be made to that of Mr. T. A. Rickard, of San Francisco, California, the subject of which was "Mining as an Investment." Couched in simple, but effective, language, and containing the essence of long years of experience as a mining man, it was a liberal education in itself and furnishes a guide to those contemplating such investment which could not well be bettered. Then there was the address of Mr. H. M. Lawrie, Chairman of the Oregon Bureau of Mines on "Gold." In view of the exceptional interest in this subject, to say nothing of the very able manner in which it was handled, in this case, keen interest was manifested by the assembled delegates. Some of the other papers may be briefly enumerated as follows: "Government Control of Smelters," Sydney Norman, Spokane, Washington; "The Better Preparation and Utilization of Coal," G. W. Evans, Coal Mining Engineer, Northwest Experiment Station, U.S. Bureau of Mines, Seattle, and Francis W. Glover, Princeton Coal and Land Company, Princeton, B.C.; "The Prospector, What He Should Be and How to Encourage Him," J. P. McConnell, Vancouver; "Taxation of Mines," Valentine Quinn, Granby Consolidated Mining and Smelting Company, Vancouver, B.C., T. W. Bingay, Consolidated Mining and Smelting Company, Trail, B.C., Nicol Thomson, Chairman, Mining Committee, Board of Trade.

The Price of Silver.

There were not many resolutions acted upon by the Convention, but several of them are of first importance. That which may be said to take premier position in this respect relates to the fixed prices placed on silver. The resolution asked that the Canadian Government use its influence with the Government of Great Britain with a view to the abolishment of the present fixation of the selling prices of this metal. The mover of this resolution claimed that the authorities were not treating silver fairly, following out the policy indicated. He said that Canada, as a producer of silver, was losing a lot of money as a result of this action, placing the figure roughly between $4,000,000 and $5,000,000. His opinion was that no argument could be advanced to justify the maintenance of this fixed rate, it was unjust to the producer and unjust to Canada and he expressed the hope that the Convention would not hesitate to go on record in favor of its abolishment. Silver, like any commodity should, now that the war is over, be permitted to find its own level as to price. He was convinced personally that, if this course were pursued, silver would rise considerably above a dollar an ounce, as the demand was great and would, beyond a doubt, grow greater as time went on. There was a market for any quantity in the Orient, Russia, as was true of any country which is misgoverned as those are. Being distrustful of those placed in power, the people horded their gold and their silver, and the latter was particularly in demand as a medium of exchange. It was only fair to those who are producing this metal that they should be allowed to reap any reward that might be coming as a result of these conditions. He predicted that silver, if placed on the market without restriction would advance to $1.20, $1.30 and perhaps $1.40 an ounce. Mr. Smith Curtis was responsible for the foregoing observation, and he was endorsed by Mr. T. A. Rickard, as well as by the great majority of the delegates including Mr. G. A. Caldwell, who represents the producers of the boundary district of British Columbia. Mr. Caldwell spoke very vehemently, and warmly endorsing the sentiments expressed by Mr. Smith Curtis and declaring that the fixing of the price of silver was the work of plutocrats. He expressed the belief that Governments these days were particularly keen to keep their fingers on the pulse of public opinion; that Governments would be careful under present conditions to do nothing that could be avoided antagonistic to the general sentiment; and that if the International Convention went on record in this matter it might have the desired effect at Ottawa. There was some opposition to the proposal, several speakers asserted that the policy with respect to silver had been adopted by Great Britain only after very careful consideration in order that the social equilibrium of the Indian Empire might be maintained. They declared that any interference with this would embarrass the Government of Great Britain and that under the cir-

cumstances it would not be wise to take the action suggested. Their view was that it was an Empire question and that the question of the welfare of the Empire should be placed before any monetary advantages to Canadian silver producers. The resolution, however, carried.

A Government Exploration Party.

Mr. S. S. Fowler, of Nelson, B.C., was sponser for a resolution proposing that the British Columbia Government be asked to provide for and equip an exploratory party, the duties of which would be to explore the vast North-Eastern section of this province, of which to date very little is known. It was true, Mr. Fowler said, that the section referred to from what little information was available did not seem to offer exceptional promise as a mineral producing zone. Very little, however, could be told of the resources of the region in question and he was of the opinion that the Government would be amply repaid for the expenditure that might be involved in assembling detailed data relating to the territory he had in mind. He instanced the Black Hills of Arizona as being a striking illustration of what an unpromising district may ultimately develop into. Every one knew the Homestake Mine of the Black Hills. It had produced millions of dollars in gold and there were associated with it other gold producing properties not as much heard of because overshadowed by the Homestake. But the Black Hills originally had been looked upon as barren of mineral of any kind. Was it not possible, he asked, that the vast unexplored region lying along the northern boundaries of British Columbia did not possess such riches as these. It was a section 107,000 square miles in extent, only ten per cent smaller than Great Britain and Ireland combined. At any rate he felt that the Government should undertake such work as suggested. Mr. Fowler's resolution met with the hearty approbation of the Convention and was carried without dissent.

University Education.

That the Provincial Government should be asked to provide a more substantial vote for the carrying on of educational work at the University of British Columbia was the purport of another resolution. Mr. Smith Curtis, in dealing with this, pointed amid some amusement that the University of the Province, notwithstanding the first importance of the mining industry of the country, was allowed only $15,000 this year for the maintenance of its geological and mineralogical departments. He declared that it was very important, in order that Canada maintain a high position industrially, that the technical education of its young men and women be of a high standard. This could not be more aptly illustrated than in the case of Germany, which country had gained its prominence in the industrial world through its system of intensive technical education. He was not by any means suggesting that the example of that ruthless Empire should be followed in its application of knowledge but was strongly of the opinion that, in order to obtain the best results in the development of the country's natural resources, provision should be made for teaching the younger generation all that modern science has to offer. For these reasons he endorsed without qualification the proposal that the Provincial Government be asked to provide more generally for its mining educational facilities of the University of British Columbia. This resolution also carried with enthusiasm.

Other resolutions, all of which were endorsed, may be summarized as follows:

Other Resolutions.

That the Provincial Government be asked to provide an Assay Office and facilities for the assay of ore at Prince Rupert, British Columbia.

That the Minister of Mines for British Columbia be requested to arrange for a tour through British Columbia with a party of British and American Mining Engineers, expenses of the same to be defrayed by the Government of British Columbia.

That the Department of Trade and Commerce be requested to arrange for the filming of British Columbia mineral samples and to use said pictures in connection with the advertising programme it now is preparing.

That the Postmaster-General of Canada be petitioned to remove the present restrictions placed by the Dominion on the importation of such second-class mail as representative American mining magazines.

That Members of the Convention assist in a movement proposed by the Spokane Chamber of Commerce, having as its object inauguration of a campaign of cleanliness in America (the idea of the Spokane Chamber of Commerce is to endeavor to induce the large cities to begin repainting their public buildings as well as private dwellings on a large scale. It was pointed out that this would increase the consumption of paint which is made up of a very large percentage of lead, and that, if the movement is successful, it not only will do good in the improvement of the appearance of communities, to say nothing of the improvement of sanitary conditions, but will in a very short time remove the present embarrassing surplus of lead.

The Opening.

The International Convention opened at 10.30 o'clock on Monday morning, March 17th, a short address of welcome being delivered by Acting Mayor Woodside. He congratulated the Chamber of Mines on the representative character of the gathering, referred to the importance of the mining industry to Vancouver as well as to the country generally and assured the visitors of the hospitality of the city of Vancouver. He advanced the suggestion that the work of opening up mining possibilities of the Province might be greatly assisted by the returned soldiers. There were many of these men unquestionably who would not wish to go on the land, and it was his opinion that the Government would be well advised to extent those who might wish to prospect what small assistance might be necessary. He concluded by expressing himself as assured that the deliberations would be productive of much good, and the hope that all associated with the gathering would have not only a profitable, but an enjoyable time.

Mr. A. M. Whiteside, President of the B.C. Chamber of Mines followed. His discourse was the same general character as the preceding speaker, but he continued by giving an outline of the programme prepared for the entertainment and edification of the delegates. Honorable William Sloan, Minister of Mines, then was introduced and formally opened the Convention in the following terms:

The Address of the Minister of Mines.

It is in my opinion a great honor to be permitted to perform the official duty of opening such an International Mining Convention, the first of its kind to be held in Vancouver. I wish, therefore, Mr. Chairman and gentlemen, to assure you at the outset of my appreciation both of the honor accorded me and of the responsibility of my task. My experience is that it is important that a Convention such as this should start well in order that it may progress and finish well. The proper understanding of our subject in gathering together should be developed and we should from the beginning allow full scope to that fraternal spirit and that common enthusiasm which mean everything if we are to derive the full benefits, in instructions and entertainment, from our three days association.

I want to congratulate the officials and members of the British Columbia Chamber of Mines. It is only necessary to glance about this hall, and to note the representative gathering of mining men, men of all classes of mining and from all parts of the Western Continent, to realize that the Vancouver Organization already has scored a pronounced success. We have visitors, distinguished visitors, here from California, Oregon, Washington, and other states of the neighboring republic, and I would be remiss if I did not, at this point, explain to them, not only as Minister of Mines of the Province of British Columbia but as a citizen of Canada deeply interested personally in the advancement of the mining industry in this country, that they are most heartily welcome. We are indeed glad to see them, and we shall look forward to hearing their views on the varied problems we are all facing as well as to the few days of pleasurable association before us. They have come, in most instances, from long distances to take part in the discussions which our programme proposes and to assist by giving us expression of opinions gained, in many cases, from practical and long experience. We appreciate their presence, we shall listen to and profit from what they have to say, and we sincerely hope that they will enjoy in every sense their stay in this city. As Minister of Mines I wish also to express my appreciation of the large attendance of British Columbia mining men. It is a pleasure to witness so practical a demonstration of their interest in the mining industry. I am sure that they will find their time well spent, in fact that must already be patent to them, at least to those of them who have had the opportunity before this of inspecting the very creditable exhibition which the British Columbia Chamber of Mines has prepared for our edification. And now just let me say that in my judgment it would be difficult to arrange for an event with greater possibility of good results in the advancement of the mining industry of the American West. I use the term "American" because it is applicable to the entire North American Pacific Coast, and I take it that the presence here of representatives from California to the extreme British Columbia North means that we appreciate that our interests, in so far as mining and its allied industries are concerned, and in no sense divergent but, in all their big and real problems, of a common nature. It is, therefore, very pleasing to face a Convention so constituted because of the confidence it gives that we are prepared to go forward, should to shoulder, with the united purpose of developing the great mineral resources of our united countries.

Now I might launch into an exhaustive account of the history of the mining industry of our province from the earliest years of its settlement, but it is not my intention to so occupy your time. We have all read with keen interest of the discovery of coal in the early fifties on Vancouver Island and know of the subsequent development of that industry; most of us are well acquainted with the chief incidents of the Cariboo gold rush in the Sixties, and I venture that there are few mining men of this Province who have not listened to romantic stories from the lips of our worthy pioneers; there are men within hearing who could recount anecdotes of fortunes made by lucky holders of stock in those companies which sprung into prominence when Rossland Camp came into its own; and there are many here, no doubt, who are capable of giving a connected history of the development of the metalliferous mining of Kootenay, Boundary, and North and Southern Coast Districts of the Province. For myself I could, were I so inclined, regale you with some stories of the Klondyke, of fortunes made and fortunes lost overnight, of hardships endured and grim struggles having for their goal both life and gold, that would make the misfortunes of Robert Service's Sam McGee look tame. But again, I am not going to inflict these upon you. We are not here, I assume, to turn our eyes back in contemplation of the past but rather for the purpose of casting our eyes forward and preparing, in some measure, for the great task that lies before me.

A Good War Record.

It is interesting, however, for a moment that we should give ourselves the satisfaction of considering British Columbia's mineral production for the year 1918 because the record created, according to the conservative estimate prepared by the Department of Mines, is one upon which all our mining men may congratulate themselves. I trust that our visitors will not think that we are "patting ourselves on the back" unduly when I point out that the value of British Columbia's output for the last year was greater than that of the previous year while decreases are shown in six of the adjoining states. I refer to Utah, Nevada, Idaho, Colorado, California and New Mexico. The monetary value of the production of the Province for 1918 was $41,083,093, which is $4,072,701 greater than 1917, or the equivalent to an increase of 11 per cent. Only once in the history of the Province's mineral statistics has this output been exceeded and that was in 1916. And it is specially gratifying to contemplate the results of 1918, when it is remembered that 1916 was a phenomenal year, metal prices being abnormally high owing to war conditions.

If we take metalliferous mining alone we find that the difference as to value of output is not substantial, the total for 1918 being $27,288,161 and that for 1917, $27,284,474. These figures, however, are not a fair basis on which to estimate actual production for the reason that the war in 1917 was at its heighth and prices still were in the same position while in 1918 they began to drop. Thus we find that, while in 1918 our mines produced 63,387,010 pounds of copper as against 59,007,565 pounds in 1917, there is a decline in value of $356,310. We also produced more lead last year but again, owing to price, a decrease is shown as to valuation. As to zinc there was a decline both in quantity and value. Coming to silver we find the condition reversed, production being slightly smaller but an increase in value of $335,371 being recorded through improvement in prices. As to gold, British Columbia, I am happy to say, is in the exceptional position of having increased her output while most other countries, owing to

its fixed value and generally rising costs, have fallen back. It was our lode mines which sent production ahead, the improvement amounting to $883,705. Our placer grounds, both in respect of hydraulic mining companies and the Individual miner, did not do as well, and as to the latter, to their credit be it said, the explanation is found, to a considerable degree, in the fact that those who could get away had volunteered and were fighting the battles of Canada and the Empire on a foreign field. Costs, of course, affected this class of mining seriously, but it is a notable fact that British Columbia placer mining camps were practically denuded of their young and able-bodied English-speaking manhood by the war. They were among the first to go, and they have brought honour to their country and to themselves. Before passing from this subject, it is interesting to speculate on the possibilities of the future of the Province with respect to gold mining. As I have said, despite handicaps which threatened this phase of the industry throughout the world, which were considered so serious that representative business men and mining men in the United States and elsewhere, discussed the expediency of bonusing the production of gold, British Columbia made a better showing in 1918 than in the previous year. It is to be remembered, too, that the Rossland Camp during this period was practically closed down, and it isn't necessary for me to explain to British Columbians that this is the largest single gold producing centre of our Province. The explanation, Mr. Chairman and gentlemen, is to be found in the accession to the shipping mines of the Province of the Surf Inlet property of the Belmont-Surf Inlet Mines, which made an output of 43,000 oz. And the reason that I mention this specially is to indicate the potentialities of British Columbia as a gold producer alone. When one mine is found sufficiently rich to so materially affect the Provincial production what may we not look forward to with the proper development of our resources in this respect? Should we not, I ask, with Rossland working to the extent of its capacity; with our other notable lode mines continuing production and other good prospects being developed; with our placer grounds being exploited to the fullest extent as in the past; and with labor more plentiful and costs at a more normal level—should we not, under such conditions, look forward to our Province taking a leading place on the continent as a producer of that standard of exchange for which the world, after the extremely trying ordeal through which it has passed, is very much in need in order that its economic equalibrium may be maintained?

Coal Mining.

Leaving the metalliferous branch of mining for the moment I want to refer to coal mining—one of the most important of the mining industries of the Province. I am pleased to note here that there are representatives of the collieries of British Columbia in attendance and that the programme committee has recognized the place they fill in our industrial life by providing for a discussion on questions which are of peculiar interest to them. I wish further to congratulate the collieries on the splendid effort they made during the four or more years of war to meet the urgent need which we, and the empire as a whole, had for their product. Both the operators and the miners are to be felicitated on the plucky manner in which they stuck to their guns throughout the whole period of the war. They have the satisfaction of knowing that they did their bit to the fullest extent and I for one would have them understand that their work is appreciated. And I would not have it taken that in making this reference I am considering only the coal operator and the coal miner. They occur to me in this connection, perhaps, because I hail from the coal mining city of Nanaimo, which constituency I have the honor to represent in the Provincial Legislature. After all, all mining endeavor, of whatever class, is so inter-related as to be inseparable. So if I mention coal miner and his war work, I wish also to be understood to include the metalliferous miner. For though coal was a prime essential for the successful prosecution of the war so was copper, and lead, zinc and coal—and I might go right down the list. The operator of the Province and the miner of the province, whatever you found him, did his best. There were, of course, some misunderstandings, but they were quickly righted in most instances and generally, throughout the years of conflict, the spirit of patriotic service was so manifested as to make on proud of our country and of its people.

As to the coal production of 1918 a few figures may not be amiss. The Provincial Collieries show outputs, both of coal and coke, exceeding those of the previous year; the increased output of coal being some 142,093 tons, while that of coke was 30,751 tons. As the value of coal has advanced substantially the product of our coal mines for 1918 represents about $12,794,932, an increase over 1917 of $4,310,589.

If I may be permitted I wish here to make a few statements of facts as to the policy of the Provincial Government in respect of the Mining Industry. One of my first acts as Minister of Mines was to divide the Province into six mineral survey districts under the terms of what is known as the Mineral Survey Act. Over each District was placed a competent, fully qualified mining engineer. The object of this, briefly and generally, was to bring the Government and the mining fraternity of British Columbia into closer touch one with the other. The work entrusted to these mining engineers and the powers given them are laid down in the Act to which I have referred, and it is not necessary for me to recapitulate them in detail. It is sufficient to say that they were to meet each season in person as many of the prospectors, mining men and operators of their respective districts as possible. Listen to their difficulties and their problems and assist them in reaching solutions. Examine mineral claims, prospects and mines which required roads, trails, or bridges to facilitate their development and report as to whether in their judgment the future of such properties was such as to warrant an expenditure of Government moneys to assist in such work. They also were to obtain an intimate knowledge of their districts from a mineral and geological standpoint. Personally, I believe that they have done and are doing their work well. On their recommendations the Government has expended $207,523.34 in assisting the development of the mining industry under the mineral survey and development act. Since January 1st, 1917, there have been built 98⅞ miles of mining roads; 75 5/6 miles of mining trails and there have been repairs 437¼ miles of mining roads and 420¼ miles of mining trails. This is a record which, I think we are entitled to view with some satisfaction.

The engineers to whom I have referred have accepted invitations to address this convention, and I believe that you will find what they will have to say regarding the mining conditions in their respective districts will be interesting and valuable. They have been requested to deal with two special points, namely, the particular

HON. WM. SLOAN,
Minister of Mines, British Columbia.

sections of their respective districts that offer opportunity, and the best chances of good results, especially to prospectors looking for profitable fields in which to give their attention and the particular sections of their districts that offer the most promising possibilities for mining development. In my judgement we all find a discussion of these points by men who know of what they talk, most interesting and it will be specially valuable to mining men actively interested in the advancement of the industry in British Columbia to obtain this information and also especially valuable for those with capital for investment in mining properties.

Then there is the question of the development of our iron ores and the laying of the foundation for an iron and steel industry. This, gentlemen, is a big problem. It is one that might easily be made the exclusive subject of an address. I am not going to attempt to go into it exhaustively. When I assumed office it was with a conviction of the importance of this matter and an ambition to do something that would give the Province a start. How to begin was the question. It seemed to me that the first step was to secure ample data as to our resources and the work was instituted and still is in progress. I next recommended that the Government offer a bounty on the production of pig-iron in the Province and this was done. An Act now is on the statutes providing a bounty of $3 a ton on pig iron manufactured in British Columbia from local ore and $1.50 for pig-iron manufactured in the Province from foreign ore. My attention having been drawn to the possibility of overcoming the difficulties existing in the smelting of our magnetite ores without the haematite for fluxing purposes by means of the electro-smelting method, I decided to have an expert make a report on this phase of the question. Accordingly, Dr. Alfred Stansfield, an acknowledged authority on this continent on the question, was given a commission to investigate and submit a report on the feasibility of treating British Columbia iron ores by the electro smelting process. His report has been received and was laid before the Provincial Legislature at the session now in progress. He finds that the treatment of our ores by electric smelting is not only feasible but practical. The only difficulty he finds is in the expense of electric power. That must be overcome in order, if we are to treat the iron ores of this province in this way, that British Columbia pig iron may be produced at such cost as will enable it to take its place successfully in the markets of the world. And now I come to our most recent declaration of policy on this question. There are at present two firms possessing small smelters close to Vancouver whose representatives came to me recently and said, in effect, "If the Government will guarantee us a supply of magnetite ore at a certain rate for a specified period, we are prepared to make necessary changes in our plants to put the electro-smelting process of these ores to a practical test." After consideration the Government agreed to this, and the result is the introduction of legislation at the present session giving the Minister of Mines power to take ore from iron properties which are lying idle for such experiments, the owners, of course, to be recompensed. In leaving this subject I wish only to add that the Government is sincere in its desire to promote this industry, that it is fully alive to its importance, and while it will continue to offer every encouragement to those manifesting a desire to assist in launching such enterprise. I am hopeful that, as in Nova Scotia, where one of Canada's premier industries grew from a small forge-shop in a trifle over sixty years, one or both of the small plants to which I have referred will prove to be the basis of the industry which we are all so anxious to see flourishing in this province.

The Future.

The future, Mr. Chairman and gentlemen, is bright. We are now busy making preparation for an assured season of pronounced activity. Keeping the conditions in mind it is gratifying to find in our province that the largest companies are pursuing the policy of keeping their organizations as well staffed as possible by undertaking development work, improvements, additions to plant in order that their men may be kept busy and their industrial machinery prepared for the opening of the reconstruction period. The tendency of the future is and will be towards closer co-operation between employer and employee.

The development of this policy to the fullest extent, in my opinion, will brush away many industrial troubles and lead to amity, prosperity, and mutual goodwill in all industrial centres.

As far as the Government of this Province, of which I have the honor to be a member, is concerned, I have no hesitancy in saying that, while it will use all its influence towards the preservation of these good relations, it realizes the importance also, and in fact the necessity if our resources are to be developed, of pursuing such a course as will assure Capital a legitimate and fair return on investments which must necessarily be made in the opening up of our undoubted mineral resources.

If this spirit is engendered now and if we all face the present with tolerance and in the united determina-

tion to bridge the gap the reward will come as surely as the sun will rise tomorrow. And when the nations turn their eyes and thoughts from the tremendous and deadly struggle into which they have been plunged and direct attention to the reconstruction of all that has been destroyed by the scourge of war. This change cannot be much longer delayed. Soon the world will be plunged, almost as feverishly and as largely, into the work of re-building as it did into the task of defeating that evil which the Kaiser's Germany represented. And then will come the demand for everything into which the metals of our mine goes. There will be a good market, a steady market, and what is particularly gratifying, our product will go, not into implements of destruction, but into articles for the acceleration of peaceful pursuits—the advance of civilization. There will be plenty of work for all our mines and smelters, if, I may venture on a further prophesy, will be figuring on means of increasing their productivity.

I wish again, Mr. Chairman and gentlemen, to thank you for the opportunity given me of addressing you. I trust that you will have a very pleasant and profitable time in the course of this convention. It seems to me that it cannot but be of great benefit to the mining industry of this province as well as to the entire Pacific Coast.

Once again, on behalf of the Government of the Province of British Columbia, I extend a cordial welcome to our visitors, and more especially to those visitors from across the line. Mr. Chairman, there is no line. We on this continent have lived in peace and harmony for over 100 years. In the great Conflict, which has just been so triumphantly concluded, the sons of the United States and of Canada, your sons and our sons, have mingled their blood on the field of Flanders in the fight for common freedom. We have been cousins in the past, but now and for the future we are brothers.

Mr. Chairman, I have pleasure in formally declaring this convention open.

COL. LEONARD AT THE Y. M. C. A. LUNCHEON.

At noon there was a complimentary luncheon under the auspices of the National Council of Y.M.C.A. Industrial Department, the chief speaker being Lieutenant-Colonel R. W. Leonard, St. Catharines, Ont., President of the Coniages Reduction Company, and President of the Canadian Institute of Engineers. Colonel Leonard in a brief address explained that he was on the coast on a holiday when approached to say something as to the benefit of Y.M.C.A. industrial work to the Convention delegates; he, therefore, was not present as the official representative of the Canadian Institute of Engineers, but was sure that he was conveying the sentiments of the members of that organization when he extended their greetings and their best wishes for the success of the Convention. As to Y.M.C.A. work, there were no terms too emphatic in its commendation. He had seen it in operation overseas, and the only criticism ever heard was that the Y.M.C.A. bases were all at the front, and few were to be found very far back from the line. Experience gained in Eastern Canada in connection with industrial concerns was that the Y.M.C.A. was a great help in providing means of education, of entertainment and other profitable lines of occupations for the workers. He had no hesitation in recommending employers of large bodies of men to permit the co-operation of the Y.M.C.A. Industrial Department for the maintenance of good relationship between management and men and for the creation in industrial centres of a general feeling of contentment and happiness.

In the afternoon the chair was taken by Dean Henry Landes of the University of Washington, who filled it very acceptably. This session was featured by a series of addresses by the mining engineers of the Province of British Columbia. This Government staff of technically qualified men has a membership of seven at the head of which is Mr. William Fleet Robertson, Provincial Minerologist. The other six preside over the mineral survey districts into which the province has been divided under the terms of the Mineral Survey and Development Act. Each of these engineers had been asked to prepare a paper on the mineral resources of his particular district bearing in mind two specific points, namely: areas in which good results might be expected from prospecting endeavors and areas which, in his judgment might be expected to furnish good returns on invested capital. As these are two important matters, and as the information expected is of great importance to the prospectors and to the intending investors the addresses of the engineers were looked forward to with much interest, and the hall was crowded when they were announced.

Mr. Fleet Robertson was first called, but confined his remarks to the statement that the estimated value of the mineral production of British Columbia for 1918, as contained in the official bulletin entitled "Preliminary Review and Estimate of Mineral Production, 1918" was well within the facts. This showed that the 1918 production reached the total value of $41,083,093. Mr. Robertson was glad to say that this figure was more than within the mark and that when final returns were available it would be increased to a slight extent. He excused himself from going further into the matter of the mineral resources of the province on the ground that the engineers who were to follow were more closely and directly in touch with conditions within their respective districts.

THE NORTH WESTERN MINERAL SURVEY DISTRICT, B.C.

By G. A. CLOTHIER.

Mr. George A. Clothier, Prince Rupert, engineer of the North-West Mineral Survey, Number 1, then was introduced. His address follows:

A year and a half ago the Provincial Government divided the Province into six Mineral Survey Districts and placed a qualified Mining Engineer over each District.

I was appointed for North Western District No. 1, which, as the name indicates, includes all that North-Western portion of the province extending from Seymour Inlet, north to the Northern boundary of the province, a distance of about 600 miles. It varies in width, exclusive of the islands, of from 100 miles along the G. T. P. to the full width of the Province in the North, where it includes the Liaid Mining Division.

It contains many distinctly favorable features and advantages, both geographically and geologically, which are probably not appreciated by the prospector and mining people.

Of the 600 miles in length there are about 300 miles of direct coast line, the remainder consisting of that portion lying behind the Alaska strip, with the exception of the Rainy Hollow section lying west of the Lynn Canal and accessible by waggon road from Haines.

The Coast Range consisting of grano-diorite, extends the full length of the district and is bordered on each side by the sedimentary rocks through which it has intruded.

For convenience in description of the prospecting areas the District may be divided into three parallel zones or belts, viz.: the main, granite, coast range, which varies in width from 50-100 miles; the Western Contact Zone, extending practically from the coast line westward and including all the inshore islands and those of the Queen Charlotte Group further West. In my district the Western contact belt therefore extends from the head of Vancouver Island north to Portland Inlet which forms the Southern boundary of the Alaska strip, and also an area in the extreme north-west corner known as the Rainy Hollow Section. The third is the Eastern Contact Zone, extending roughly from Terrace on the G.T.P. north to the Yukon-B.C. boundary line, a distance of between 400 and 500 miles, the Kitsumkalum and Lakelai Valleys probably marking the immediate contact of the granite and interior formations.

Taking the first mentioned belt, the granite coast range, its importance from a prospecting standpoint is exemplified by such showings as the magnetite deposits on Seymour and other inlets in the Bella Coola Mining Division; the quartz veins of the Belmont, Surf Inlet Mines Co. on Princess Royal Island; the Drum Lummon property on Douglas Channel; the immense pyrite deposits on the Estall River; the Outsider and Maple Bay groups at Maple Bay on Portland Canal; the Georgia River Mining Co.'s showings in Portland Canal, each representing a different class of ore deposit withing the granite, and as such of special interest to the intelligent prospector.

The Belmont Surf Inlet.

The Belmont, Surf Inlet, ore consists of a quartz vein carrying pyrite and chalcopyrite with gold and silver, averaging in all values about $12.00 per ton, and in width 14th. or more, recent work showing an increase in vein width over the upper and older workings.

The vein has been formed in a sheared belt in the granite, the shearing action providing the channel through which the silica and mineral bearing waters have circulated and deposited their loads, in the form of a quartz vein. Prospectors should therefore note any signs of movement in the granite.

The property is equipped with an up-to-date plant, in every way. The Concentrator is of 300-ton daily capacity, using both water concentration and flotation the ratio of concentration is 10-12 into one, and the recovery very satisfactory.

The company has man an enviable first year's production of approximately a million dollars, mainly gold, but with some silver and about a half million lbs. of copper. Quartz veins in the granite seem to pay pretty well.

The Drum Lummon represents a different type of deposit in that it is a replacement vein following along an acidic dyke, which has formed the necessary channel for circulating waters. These replacements of the granite in quartz vary from a foot to ten feet in width, and carry varying amounts of the high grade copper sulphides, corellite and bornite, with chalcopyrite. The equipment consists of a small compressor and a recently installed mill of the Gibson type, with which experiments will be taken on in the Spring.

The extensive pyrite deposits on the Ecstall river represents still a different type, occurring in a wide belt of sedimentaries enclosed in the granite.

The Maple Bay deposits are quartz, mineralized with pyrite and chalcopyrite, and seemingly are filled fissures in the granite.

The Outsider group shipped several thousand tons of ore some years ago to the Crofton Smelter, returns from which show an average of 56 lbs., or 2.8 per cent copper per ton. It has again been under development during the past year with very encouraging results, showing a big tonnage of concentrating ore which I judge would respond well to flotation treatment.

From the above samples of properties which have been found in the granite, I would think that this zone would be well worth the prospector's attention. It is the cheapest and most accessible area to prospect that I know of. Fishing tackle and a gun will furnish 75 per cent of a prospector's grub and there are thousands of miles of bays, inlets and canals, curving into the mainland, providing not only prospecting routes, but assuring unequalled transportation facilities for lower grade ores than could otherwise be handled.

Opportunities for Prospectors.

It has never been systematically prospected, though there have been hundreds of claims staked by fishermen, hand-loggers and trappers; if there is a real prospector present I would ask him what the general run of loggers or trappers know about mineral. What this Section and in fact the Province needs more than anything right now is prospectors—what I am.

I might add that there are a number of promising looking prospects requiring a little money to try out.

Taking up then, the second, or Western Contact Zone, which includes all the islands, the Queen Charlotte and those near the Mainland, we have practically the same prospecting conditions, but a different formation. This is composed of sedimentaries, altered more or less near the granite, and intruded by many spurs, and isolated masses from the main granite range, as well as cut by many dykes of all kinds of igneous rocks, all tending to produce conditions exceptionally conducive to the circulation of mineral bearing solutions and ore deposition.

The Ikedo Mines on Morseby Island of the Queen Charlotte Group has shipepd for several years producing several thousand tons of high grade chalcopyrite ore.

The South-Eastern, on Graham Island, has been under development for the past year with results that warrant further extensive investigation. Several other properties are also being explored by mining men.

There are good and sufficient reasons why the oil showings on the Islands should receive a thorough investigation, something they have never had yet.

The islands near the coast have never had any amount of real prospecting.

The third belt, on the Eastern Contact Zone extending as stated from the G.T.P. north to the Yukon-B.C. boundary line, a length of 400-500 miles. This zone has been opened up principally at the head of Portland Canal and Observatory Inlet or Alice Arm, and I have no hesitation in saying that if the balance of the zone equals the known portion, it will prove the greatest mining area on the continent.

This portion of the District lacks the natural transportation facilities of the Coast Section, it being only accessible in spots, but they have proved and are still proving to be *some* spots.

The furthest south available point on it, in my District, is on the G.T.P. where the granite range is about 100 miles wide. Some little prospecting has been done in this Section resulting in some fair showings on the Zymoetz River, Thornhill Mountain, and around Kitsumkalum Lake. I noticed a fine specimen of free gold in the exhibit from Thornhill Mountain, just across the Skeena River from Terrace.

The only place on the belt on tidewater is at the heads of the Portland Canal and Observatory Inlet.

The Granby Plant at Anyox.

The operations of the Granby Consolidated Mining, Smelting and Power Co. at Anyox have of course provided the bulk of the output of the District. The production this year in copper being about 31,000,000 as against 28,000,000 lbs. last year. The company has very extensive additions and improvements under way, notably the installation of a coke and by-products plant costing about two millions of dollars, and which, under normal conditions would have been completed early this spring.

The company has had a Pilot Mill, of 100 tons per day capacity in operation for over a year, experimenting with the concentration by flotation, of its own ores, both from Hidden Creek and its Alaska properties. The flotation of the silicious ores has presented no difficulties, and I understand that some measure of success has been obtained in the selective flotation of the heavy sulphide ores. This company has been a boon to mining on the coast, for its engineers are always in the field for ores suitable for its purposes. They have done a great amount of exploratory work principally by diamond drilling and at all times has been a God-send to the prospector and small operator when supplies were necessary.

The Dolly Varden.

In the Alice Arm Section a great deal of development work has been done principally by the Dolly Varden Mines Co., whose holdings lie about 19 miles from tidewater up the Kilsault River, this property and the Wolf Group belonging to the same company, and lying about two miles further up on the river on the east side, has an immense tonnage of commercial ore, estimated at a half million tons, proven by diamond drilling. The average ore will make a fine grade for milling purposes, and there are several thousands of tons of high grade shiping ore ready to be mined.

The company has been engaged during the past two summer seasons in constructing a railroad from tidewater to the mine. This work has been delayed for different reasons, but it is hoped that all difficulties will be early adjusted in order that the district dependent on the operation of the railroad will have the opportunity for activity which transportation will give. A very complete report on this section was made by Professor Turnbull and published in the Minister of Mines Report of 1916. I went over the Section again during the past season, and as the yearly report will be published shortly, think it unnecessary for me to go into detailed description of the different properties. I was very favourably impressed with the whole section, and I look to see at least eight properties other than the Dolly Varden quickly develop into shipping properties as soon as rail transportation is assured. In fact, I have never before seen, in such a comparatively small area, so many strong, well defined veins and no section where there are better chances for the mining investor. From a prospector's view the Kitsault River has been fairly well staked on both sides, but I believe there is still plenty of vacant ground higher up. There is one good feature of this particular section, and that is that there has been little or no blanketting of the country by individuals staking claims, and therefore there are more individual owners and more assessment work, and good intelligent work, too, in the majority of cases, than in most sections, all going to show that where this Eastern belt is intelligently prospected and good horse-sense used in development work, it will give satisfactory results.

The rock formation which has, so far, been most prolific of ore-bodies, is the greenstones or andesites, locally known as the Silver belt, since all the silver showings occur in it. The general vein filling is a pyritized quartz, or a pyritized silicified greenstone carrying the metallic minerals, native silver, the silver sulphides, argentite and ruby silver, and in places, galena and zinc. Such deposits or veins are shown in the Dolly Varden; the North Star adjoining the Dolly Varden on the North and possibly containing the continuation, down the hill of the Dolly Varden vein; the Toric Group; the Tiger Group; the Musketeer; the Wolf; the Second Thought; the Moose; Last Chance; Silver Horde, and other groups, all with big, well-defined veins of from 5 ft. to 30 ft. in width and the majority of them showing in places, high grade silver values and well worthy of further development.

Around the borders of these greenstones where in contact with the slates are sedimentaries, or near dykes intruding the slates, are found the copper, in the form of chalcopyrite, deposits. In this class of ore deposits there are the Homestake Group, at the head of Kitsault River, and several individual claims above it; the Vanguard Group, south of the Homestake, and on which there is a fine surface showing of calcopyrite about 6 ft. in width; the Wild Cat, on which shipping ore is exposed; and several other groups, all on the west side of the Kitsault River.

Further south, or nearer Alice Arm, the rock formation changes to a slate in which occurs the small high grade quart zsilver veins of the La Rose, the Black Bear, or Roundry property, each of which made small shipments of high grade during the past season. A trail, 2 miles long was built with the assistance of the Mines Department from the railroad to the La Rose Mine. There are also other promising looking properties such as the Independent Group in this slate formation which are under development by the owners.

Up the Reliance River, which flows into the head of Alice Arm, the slate formation of the lower Kitsault River prevails, and has the same small, high grade, quartz veins as noted on the La Rose and Black Bear properties.

So far as prospected yet the most encouraging showings are pretty well up the river, from 10 to 16 miles from tidewater. Considerable prospecting work has been done on the United Metals and the Seven Bell groups on the west side of the river, and on each of which there are several small high grade, silver-bearing veins. No depth has been obtained on either proprty, but there is every reason to believe, from the number of exposures of shippig grade ore, that they will become producers of a small tonnage of high grade ore. The Monarch groups on the east side of the river also make a fine showing, several other properties equally as promising might be described, but that is not the object of this paper. There is a fair trial from the beach to the head of the river. About four miles from Alice Arm on McGrath Mt. are several fine showings of zinc ore, notably that of the Standard group which, where an open cut exposes apparently a width of quartz of 60 ft. carrying dissiminated blend, which also occupies in brushes and hands of up to 2 ft. in thickness. The continuity of the vein has not been determined, but it is a remarkable out cropping of zinc ore. Further up the hill the Silver Band group also has a very promising showing.

Taking the out-croppings, the very encouraging results of any development, and the proven properties, into consideration, one cannot help becoming enthused with the possibilities of such a section. If the prospector could be made to understand the difference between living in luxury the rest of his life by getting, say $25,000 for his property, instead of plugging along and dying poor by wanting $100,000, there would be little difficulty in financing the promising looking prospects I look for this section to make one of the permanent mining camps of the province.

Bear River.

Further north this eastern contact belt is again being prospected and developed in that section of the District at the head of Portland Canal, up the Bear and Salmon River Valleys. There was a considerable boom on the Bear River Valley in 1910-1911, in which a lot of experience was gained by a lot of people. The Section has been more or less idle ever since, and there is no possibility of the revival of the mining industries, except absolutely on the merits of the properties.

Geologically the section is similar to Alice Arm and Angot, consisting of areas of sedimentaries intruded by dykes of all kinds, and areas of igneous rocks, principally greenstones, which appear, so far as development has reached, to be the most favourable formation for ore bodies. The remarkable discoveries up the Salmon River have done much to restore the confidence of the old timers, who have stayed with the camp, and turn the attention of the mining world to this once over-looked camp. Above the town of Stewart, up the Bear River Valley, work has been continued on several properties with results that justify the faith of the owners in their properties. It has been a hard and discouraging time, for they knew that only time or exceptional merit in a property could start anything. However, there are several properties that have the ear marks of developing into producers.

On Glacier Creek there are several good showings, while the copper showings at the head of the Bear River are improving steadily with each year's work. I look for gradual resumption of development in some of the older properties which were exploited in the earlier days. It has been the history of all camps that such properties usually receive investigation later. This valley will some day be the outlet for all that portion of the province lying north of Portland Canal and back of the Alaska Straits.

Salmon River.

The Salmon River has had the greatest attention, due to the remarkable development of the property of the Salmon-Bear River Mining Co., better locally known as the "Bush" mine. The property was worked for a couple of years by New York interests, who failed to develop any commercial ore. The present owners came along, and with practically no work opened up a high grade shoot of ore lying in the mineralized zone of actural greenstones which the former people had exploited for a couple of years.

Estimating from average samples taken all along the present working tunnel, for the length exposed along the ore shoot and the depth of backs from the surface, give a rather startling gross value of possible ore. The company constructed a sleigh road last summer from the mine to the beach, a distance of 16 miles, which has been utilized this winter for hauling down ore. Some 200 tons have been shipped, and about 450 tons have been hauled to the beach and will be shipped as soon as possible, and it is expected that 300 or 400 tons more can be taken out this winter. It is estimated that this ore will run well over $200 per ton, which will give a minimum production of $160,000 for 800 tons, in say 6 months, from a property as yet being worked by hand. Truly a wonderful showing of gold-silver ore. The very fact that so much work was done by thoroughly competent mining men without results, and the disclosure of such a remarkable shoot of ore, with other shoots only partially opened up, gives every property or showing in that section the possibility of developing into a winner. Two other properties above this one, the Mineral Hill group and the Big Missouri, have surface showings practically identical, with that of the Salmon Bear River property. The Big Missouri heretofore has been considered an immense deposit of complex ore requiring unlimited capital to develop and treat, but the uncovering of high grade ore apart from the old known deposit has placed the property on a different basis entirely. I understand that the present bondholders, D. D. Mann and associates, intend diamond drilling the new find the coming season.

Should this prove satisfactory it will mean the opening up of a section of country in the upper Salmon River Valley, for which rail transportation will be provided, and which will, I believe, become one of the great mineral producing areas of the province. Such other properties as the Yellowstone and 49 groups above the Big Missouri, the Pay Pool, the Indian Mines Co.'s property, the International group and several others, give good solid reasons for believing that the future of the section is assured with the outlay of the necessary capital to develop it. The Sleigh Road to the Salmon Bear River property will be converted into a waggon road this coming summer, and will probably be extended as a winter road for 5 or 6 miles further up the valley, on a route selected to serve the greatest number of properties. When completed this road will provide adequate facilities for getting in any machinery, etc., necessary for development work on any scale.

From a prospecting standpoint the one unfortunate feature in this and the Bear River Valley Sections is the tendency of a few individuals to stake all the country from year to year to the exclusion of others who might do some real prospecting. Several new finds were made last summer, and work done on older showings has proven very satisfactory.

Considering everything, the Portland Canal and the Alice Arm Sections give every opportunity for prospecting, and I know of no other country where an investor can get a better real run for his money than these mineral areas.

The two sections represent a length on the Eastern Contact Zone of possibly a hundred miles. Should the balance of the zone north and south prospect with results equal to this portion, the statement made a moment ago that this zone will make the biggest mineral producer in the province seems very reasonable, and looking into the future the possibilities of rail transportation, along the eastern flank of the coast range from Iskut River South to the outlet to the sea by the Bear River valley, may not be so very remote at that.

There has been some little activity in mining up the Stikine and Iskut rivers, but the navigation of these rivers has been the handicap to the prospecting of these sections. From reliable information from Dominion Public Works officials, I believe these rivers could be made navigable for six months in the year for light draught

river boats. I went up the Iskut a year ago, but unfortunately ran into a snowstorm, and was able to see only a portion of the country along the river. I expect to make a trip this year from the Iskut south along the east of the coast range to the Bear River valley.

Of the country at the head of the Stikine and the Dease Lake section I have no knowledge except reports by men who have operated in there, and who are very optimistic. This section I hope to include in my work for the coming year.

Further north the same eastern contact zone is again found in the Atkin Lake section reached from Skagway by the White Pass R.R. to Carcross, where the lake steamer loads for Atkin. This section has produced many thousands of dollars in placer gold, and from my observations this year will, I judge, produce for many years to come. Lode mining has always been neglected for placer, and I was surprised at the small amount of prospecting that has been done. It is probably one of the finest sections in the province during the summer months. Atlin Lode being 2,200 elevation, the surrounding hills are comparatively low, with little or no timber except along the lakes and in the creek gulches, therefore an ideal country to prospect so far as weather and other conditions are concerned.

The only properties under operation, other than the placer, were the Engineer and the Lacediere Group. I visited several showings all about the same characteristics, quartz veins lying in the sedimentary rock formation, which is the prevalent formation of the section. I also went over the Venus and Venus extension groups just across the B.C. Boundary in the Yukon Territory.

The Engineer Mine.

The Engineer Mines is the most important property in that section, and has been developed to that stage where a larger plant is necessary. I believe the owner, the late Capt. Alexander, who went down on the Sophia, was on his way out to complete negotiations for the sale of the property. It is a wonderful showing of Bonanza ore and when put on a good working basis should make the largest gold producer in the province. 600 lbs. of ore taken out in ordinary development work from the drifts from the shaft, produced 24 lbs. of gold. Comparatively little work has been done on surrounding properties, no doubt because of the prohibitive cost of everything pertaining to mining, and especially there, where incoming freight costs from $50 to $60 per ton. The White Pass Railroad were giving a rate of $8.25 per ton in car lots from Atlin to Vancouver or Tacoma, showing that the freight rates on ore are not excessive.

There is an immense area of accessible country, practically unprospected except along the lake shores, from the Yukon-B.C. boundary line, south of Take Inlet, along this Eastern zone, which should be as favourable a section for exploration as any in British Columbia.

This country was practically depleted of men during the war, but I have no doubt that with the return of so many whose training has fitted them for just such a life, that there will be quite a rush to the north again.

There are many exposures of quartz which have had only a small amount of work done on them, and which justify considerable exploration, so that there are opportunities for the investor in this section.

In conclusion, I would like to give you some idea of the importance, production and progress of this North Western District during the past four years. In 1914 the total output was..... In 1917 this had increased to $..... and in 1918 was $..... an increase of $..... over 1914 and $..... over last year. The whole due mainly to the output of the Granby Cons. Co. The main feature, however, is the fact that last year there was a new shipper producing nearly a million dollars and several others, the Dolly Varden, the Salmon, Bear River Mining Co., and the Engineer Mines, brought up to the shiping stage, and which will probably in a year's time, increase the output while coming along are other properties which are being developed to the shipping stage, and lastly, are the prospects that require the money and are waiting for your investigation.

I trust the vocational training of the best of the returned men will be along the line of the prospector for this province has got to have them.

Mr. John D. Gallaway, Engineer of the North-Eastern Mineral Survey District then read the following paper:

NORTH EASTERN MINERAL SURVEY DISTRICT.

By JOHN D. GALLAWAY.

The object of this paper is to present briefly some information regarding that vast expanse of territory now known as the North-eastern Mineral Survey District. In particular, I wish to point out, first, partly known and prospected mineral areas where claims are new held which are worthy of and waiting for further development; and second, those areas which at present are unprospected but which may be considered as promising fields for prospecting.

To begin with I am going to give you an outline of the geographic features of the district and a brief review of its mining history.

The North-eastern Mineral Survey District embraces four mining Divisions — namely, Omineca, Cariboo, Quesnel, and Peace River — with an area of 100,000 square miles. It occupies a large part of the northern portion of B.C. its western boundary being roughly, 100 miles from the Coast, its northern and southern boundaries being about 200 miles from the respective Provincial boundaries, and its eastern boundary being the British Columbia — Alberta Boundary — line.

The northern, western and southern boundaries of this district are the arbitrary boundary-lines of the Mining Divisions, but these, where practicable, always follow the watersheds of the country. The western boundary is well marked, folowing, as it does, the divide of the Coast mountains. The southern boundary extends from the Coast mountains easterly across the Fraser plateau, following a much less definitely marked watershed to the Rocky mountains, where the line crosses obliquely the axis of the mountains. The northern boundary is country which is virtually unexplored, the Liard Mining Division.

This district is a part of the Province frequently referred to as "Northern British Columbia" all of it lying north of latitude 52 degrees, and extending up to latitude 58 degrees. A large part of the district is as yet very little known and many sections are hardly explored.

The North-eastern Mineral Division covers such an immense area that its topography embraces many widely different types. An almost infinite variety of mountain shapes and reliefs can be seen, giving way in places to great expanses of plateau areas. Lakes are numerous and many large rivers ars included in the district.

In a general way this district consists of a section from the divides of two systems of mountains, with a plateau area — including mountains — lying between.

The Peace River Division is not included in this consideration, as it lies to the east of the Rockies system, and most of it belongs geographically and topographically to the Great Plains of the North-west.

Summary of Mining History.

I shall now summarize briefly the history of mining in the North-eastern District commencing with Placer Mining and then Lode Mining.

Mining in B. C. began with the discovery of gold in the Cariboo District in the early sixties, and for some time this was the only important mining being done in the Province. These placer operations centred around the old town of Barkerville, where a number of creeks yielded phenomenally rich pay. The placer production of the Cariboo District reached a maximum about 1863, amounting to about 4 million; since that time the annual output has gradually decreased, although fluctuating up and down, to about $200,000 in 1917.

As the rich diggings were worked out many expensive plants have been put in to handle the large quantities of low grade ground left behind by the old miners, but in the majority of cases these enterprises have been unsuccessful due to inadequate preliminary testing of the ground and lack of proper engineering skill. In some cases where the engineering was all that could be desired the ground proved too low grade to work at a profit. Many low-grade areas probably could be worked hydraulically but water is not available unless at a prohibitive cost of installation. Dredging may yet be used to recover the gold in some of the areas.

In the Manson section of the Omineca Division placer mining has been carried on intermittently since 1864 but has never been as important as in the Cariboo District. This area is still remote from transportation and nothing would reawaken interest, which is now nearly dormant, like a discovery of some new rich creek.

Prospecting for lode gold, silver, copper and lead commenced about 1902 in the western end of the North-eastern District, in the territory contiguous to the Skeena, Bulkley, Telkwa and Zymoetz rivers. In 1909 and 1910 silver-lead deposits were discovered in the vicinity of Hazelton, and a little later copper deposits in the Rocher de Boule mountains were located. Comparatively, little development was done on these numerous claims, beyond annual assesssment work until the completion of the Grand Trunk Pacific Railway was well within sight. In 1913 the railway was finished to Hazelton and shipments commenced from the Silver Standard mine. In october, 1914, the gap between Hazelton and Fort George was finished, and the new transcontinental railway became an occomplished fact.

Rocher de Boule.

In 1915 and 1916 there was considerable activity in the Hazelton and Telkwa sections but the high cost of supplies and scarcity of labour in the two last years have retarded development. The biggest producer in the District has been the Rocher de Boule mine which from 1915 to 1918 made an output of roughly 40,000 tons of ore worth nearly 1½ millions of dollars. About 90% of the value in this ore is in copper, the other 10% being in gold and silver in nearly equal proportions.

This property is well equipped with a 4½ mile tramway system hydro-electric power plant, commodious camp buildings, all necessary machinery, etc. It has been developed by tunnelling to a depth of several hundred feet. All this ore production so far has been shipped straight as taken from the mine without concentration or sorting. On one vein considerable tonnage of milling ore has been developed.

The mine was closed down in the fall of 1918, the reason given being: "It was thought best to suspend operations until such time as conditions became normal again."

The Silver Standard.

The Silver Standard situated five miles from Hazelton is a silver-lead-zinc property which has made satisfactory progress since the completion of the railway. The property is developed to a depth of 450 feet and a considerable tonnage of milling ore proven. There are a number of parallel quartz-filled fissures, four of which have been shown to be valuable veins. Mineralization is with galena, zinc blende, and gray copper, and the ore runs well in silver.

The property now is equipped with a 50-ton concentration plant designed and built by the Faust Concentration Company of Vancouver. The lead concentrate which is shipped to Trail will run about 50% lead and 150 to 200 oz., in silver. The zinc concentrate which is shipped to the United States runs about 40% zinc and 60 oz., in silver. The property is well equipped and in good shape for continued production. It is impossible in this brief outline of the North-eastern District to do more than indicate briefly the mineral types found.

In the western portion of the district, viz, the Skeena River, Hazelton and Telkwa Sections many different minerals are found. The occurrences may be broadly divided into two groups, copper-gold and silver-lead-zinc which however grade into one another.

Ore deposits carrying the following metals occur in the district:— Gold, silver, copper, lead, zinc, cobalt, molybdenite and arsenic.

In the south-eastern portion of the district i.e., in the Cariboo District, gold is the one important metal found, the production of it as yet having been almost entirely from placer mining, but with the possibility that in the future it will also be obtained from lode mining.

Physiographically the whole western part of the Northeastern iDstrict is made up of a part of the Coast mountains and the Bulkley mountains. Geologically this area is a promising field for the occurrence of minerals as it consists of old sedimentary and volcanic formations intruded by batholiths, stocks and inumerable dykes of granitic alioritic and allied igneous rocks. All these injections of plutonic rocks caused fracturing, shearing and fissuring of the older rocks while the expiring stages of batholithic activity as represented by emanations of mineral laden solutions and gases, provided the necessary minerals for the formation in suitable places in the fractured zones of valuable ore-deposits.

Areas in the North-eastern District where there are claims which offer possibilities for the investment of Capital.

Along the Skeena and Bulkley rivers and their tributaries there have been hundreds of thousands of claims staked. Many of the showings of course are not

worth putting stakes on, but scattered throughout are claims which have sufficient merit to warrant more or less development with the promise of eventually becoming productive mines. The predominant mineral types in all this area are copper-gold and silver-lead.

The sections which warrant the attention of those seeking mining properties are the Skeena River section, Hazelton section and Telkwa section.

In the Skeena River section the most important places are claims in the vicinity of Usk, at the head of Kleanza Creek and on the Zymoetz River slope, at the head of Legate Creek, on St. Croix Creek and on Fiddler Creek. The showings at the head of Kleanza Creek consist of impregnations of high grade copper ore in sheeted zones, which are however generally indefinite and irregular. The possibilities of this camp are along the lines of developing a large tonnage of low grade ore rather than in mining in a small way the seams and bunches of high grade ore.

During the last two years the prospectors owning claims have shown considerable energy in working on their claims. The showing here consists of high grade copper ore — bornite — closely associated with galena and gray copper. The present development shows several well defined veins in which bunches of high grade ore are found. Several properties in this vicinity are worthy of serious investigation.

In the Hazelton section there are a number of claims on Rocher de Boule mountain in which the veins are similar in type to those of the Rocher de Boule mine. Some of these undoubtedly are worth investigation and further development.

Near Hazelton the **American Boy property** which is at present lying idle has a number of veins very similar in type to those of the Silver Standard. It is developed by a shaft to a depth of 250 feet.

Nine-mile Mountain, 10 miles from Hazelton, has a number of silver-leads showings, the more important of which are at present under option to an Ontario syndicate. Other claims on this mountain are worth more investigation.

In the Telkwa section there are number of claims on and near the head of Driftwood Creek in the aBbine Range which have sufficiently promising showings to justify investigation. Of these the Victoria group owned by P. J. Higgins of Spokane and the Debenture group are silverlead properties, and the Harvey and McCabe properties contain high grade copper minerals. Cronin's property which has been intermittently developed for the last nine years and to which a 30-mile sleigh-road was constructed last year by the Government, is in this section.

Another area in the Babine range which is tributary to Telkwa is Dome Mountain on which a number of gold bearing quartz veins have been located but only slightly prospected.

Many claims have been staked near the headwaters of the Telkwa river and the South fork of that stream, and some of these may with further development prove valuable.

Intermittent development of claims on Hudson Bay Mountain has been carried on for some years past, and there are some possibilities here for leasers. These claims are not at a great distance from Smithers, the railway divisional point, and the side of the mountain is now served by a good sleigh road.

In the Cariboo district generally and in the Barkerville section particularly many attemps have been made in the past to mine gold-bearing quartz veins, but no succese has attended these efforts; many of the attempts were badly conceived and never had a chance to make good. Repeated failures have given the district a bad name with the result that it has been difficult to interest capital in any new properties or showings.

A few years ago E. E. Armstrong started prospecting in this section, and finally located claims on Proserpine mountain, about three miles from Barkerville. Mr. Armstrong spent a long time in tracing up indications of gold in the steam-gravels and panning the country far and wide, and now believes he has found the "mother-lode" of Proserpine mountain. It is to be hoped that his toil and optimistic faith will in the future be adequately rewarded.

Ther are number of well-defined quartz veins on these claims varying in width from 1 to 30 feet. These veins are mineralized in places with pyrite, arsenopyrite, and a little galena. The main valuable metal content is gold, the distribution of which is somewhat irregular. It would seem probable that the gold primarily was associated with the sulphides, but surface oxidation and leaching have in places scattered free gold through the quartz.

From the results of many samples taken, it is evident that at least portions of the veins would pay to work, and it is quite possible that further development would show considerable tonnages of ore which would pay to mill. The ore will have to be milled on the ground, and much further development is required before a large mill would be warranted. The possibilities for these claims are that when the veins are properly opened up they will furnish sufficient tonnage to mine and million quite a large scale, although average values may prove to be comparatively low grade. These properties warrant a thorough investigation by any company looking for gold properties.

Placer Mining.

Opportunities for small scale individual placer mining cannot be found to any great extent in the Cariboo District, although there are numerous places, especially on the Fraser River, where wages can be had by rocking, generally on bars of the streams. The easily reached rich ground is however worked out and during the last fifty years practically every creek in the Cariboo and Quesnel Mining Divisions has been tested by somebody. It is possible of course that some rich placer ground on the less known and far-away creeks still remains to be discovered — i.e., what might be called a new discovery — but this cannot be said to be a probability.

The Cariboo and Quesnel Divisions however now present opportunities for the investment of capital in large amounts for working the immense deposits of low-grade gold-bearing gravel which have not yet been touched. On Williams Creek there is an area which has been sufficiently drilled to demonstrate that it would pay nicely to work as a dredging proposition. Many of the creeks which are worked by the old-timers are virtually deserted, and on many of them ground suitable for hydraulicing is left. Of these the following might be mentioned: — Grouse, Antler, Cunningham, Harvey, Keithley and Fountain Creeks.

It is essential before undertaking any working of these deposits that proper testing of the ground be carried out in every case and thus not repeat the costly failures previously made in the Cariboo District.

Coal.

It has been known for several years that the North-eastern District contained many areas of coal-bearing formations, and at one time the probability of there soon being a number of producing coal-mines in the Division was regarded as almost a certainty. D. B. Dowling, in compiling the "Coal Resources of the World" for presentation to the International Geological Congress in 1913, credited the "Northern Interior" with a "probable reserve of 8,200,000,000 metric tons of coal. This estimate included all kinds of coal and included "seams of 1 foot and over to a depth of 4,000 feet." These hopes were based mainly on the coal-fields along the Skeena, Bulkley, Telkwa and Morice rivers, and the Groundhog field, which lies partly in the northern part of Omineca and partly in the Skeena and Stikine Divisions; from 1910 to 1912 considerable interest was shown in the Groundhog field.

It is to be regretted that these early expectations have not materialized although in the last few months a small start has been made by the Telkwa Collieries which is now producing about 40 tons of coal a day.

There is no question but that there are some areas in which commercial coal exists in fairly large tonnages, and it is quite probable that eventually some of these will be mined.

Many other conditions besides the actual existence of coal are necessary before profitable coal-émining can be established. Transportation and market are vital factors; of these the market question is perhaps the most important. Given a good coalfield and a good market, the transportation problem can be overcome.

The coal areas in the Bulkley and Skeena, which are close to the Grand Trunk Pacific Railway, where tested have unfortunately not as yet been proved to be commercially successful. A number of these have been drilled, and the conclusion arrived at from these drillings has been that none of these areas was promising enough to warrant the expenditure of opening up and equipping a coal-mine. In some instances the area of coal-bearing rocks proved to be small; in others the measures are so badly faulted, twisted, and broken as to make mining unduly expensive; in others where other features are favorable, the ash content in the coal is so high as to render it unmarketable. It must be assumed that all the coal in the Northern Interior is so uniformly high in ash as to make it unsaleable, as there are at least some areas where the average analyses show a lower ash content than in the average coal mined in the Province.

A combination of unfortunate factors has made the areas contiguous to the transcontinental railway of slight economic value, but there are other areas at some distance from the railway where such particular disadvantages do not exist. With these, however, the transportation question is the difficulty, as it is necessary that a coal-mine should ship its product by rail. The market question comes in here, as an assured market for a large tonnage of coal must be available before the expense of building branch railways to these far-removed areas can be considered. When the Grand Trunk Pacific Railway Company was unable to secure a coalfield in the immediate vicinity of its railway-line, the company was more or less forced to equip the line with locomotives using crude oil as a fuel. This oil comes from California and Peruvian oilfields, and the company hauls it from Prince Rupert as far east as Alberta. While this policy was more or less forced on the railway company, a more vigorous effort to develop other known coalfields might have been successful, and the opening of a productive coalfield would have quickened the general development of the country.

Another possible market for coal from this district is the coastwise and ocean-going ships which make Prince Rupert a port of call. Some years ago, however, the cheapness and desirability of crude oil as a fuel became evident, with the result that nearly all of the boats plying on the Coast were converted to oil-burners. Another possible market was therefore shut off and the local market in northern British Columbia is small. The owners of undeveloped coalfields had perforce, therefore, to adopt the wait-and-see policy.

During the last two years the economic changes wrought by the war have again brought coal back to its rightful place in the economic life and development of the nation. Coal on the Pacific Coast, and it may be said the world generally, is in great demand, as the high and ever-increasing cost of fuel-oil and its derivatives has caused the users of oil to consider the advisability of reverting coal as a source of energy. At the present time the balance is very much in favour of coal as compared with oil in point of cost per horse-power developed.

The coal area owned by the Prince Rupert Coal-fields is situated on the low divide between the Morice River and the South fork of the Telkwa River. It has been partially prospected and tested by two diamond drill-holes, and an estimate by a competent engineer gave a tonnage of 50 million tons of good grade bituminous coal in the field.

The area held by the Copper River Coal Company (for which the Yorkshire Guarantee and Loan Company are liquidators) is another promising field. It has not been diamond-drilled but a drill was taken in in 1914.

Both these areas are distant about 40 miles from Telkwa (in different directions) and therefore considerable expenditure would be necessary for branch railways before they could be opened up.

Another coalfield in the North-eastern District which attracted attention a few years ago is the Bowron River area about 20 miles easterly from Prince George, a divisional point on the G. T. P. Ry.

In considering the sections of the North-eastern District which are promising for prospecting due regard must be paid to the question of transportation. Many areas at the present time are so remote from transportation that it is inadvisable to prospect them as nothing could be done with mineral showings after discovery. But there are many areas within easy reach of the Grand Trunk Pacific Railway that offer promising possibilities to the prospector.

Some of these may be enumerated as follows:—The whole Babine range which as yet has only been prospected in a few places. This range is bounded on one side by the Bulkley valley down which the G. T. P. Ry runs and on the north-easterly side by the aBbine Lake. Silver-lead showings have been staked in several parts of the range, the most important property being the Cronin mine on which a considerable amount of development work has been done. On Dome mountain, one of the mountains of he range, a number of quartz veins carrying gold values have been staked but only slightly developed. These different claims show the possibilities of the area and much of the range is as yet virtually unprospected.

Prospecting outfits can be obtained at Hazelton, Telkwa and Smithers and from the main Hazelton-Telkwa wagon road, branch trails go into the Babine range.

The strip of country lying along the eastern flank of the Coast mountains and between the Telkwa river and Eutsuk Lake is perhaps the most promision portion of the whole North-eastern District for prospecting for lode minerals. In more detail, the headwaters of the Morice Rivers, and the territory contiguous to Loring, McAulay, Tahtsa, Whitesail and Eutsuk Yakes is recommended. At the present time this country is not even supplied with adequate trails, but this condition will soon be changed. Claims have already been staked near Tahtsa Lake, one of which, the **Emerald** group, has a remarkable surface showing of silver-lead ore. This property is under option to Mr. James Cronin and it is expected that important development will be started this summer. Improvement of the present transportation into this section is now under consideration by the Department of Mines.

Another area in which little or no prospecting has been done is north of the Grand Trunk Pacific Railway between the Kitwanga and Kispiox Rivers. This area consists mainly of the old complex of the Kitselas formation, and portions of the Hazelton formation, the whole thoroughly intruded by granitic and dioritic batholith stock and dykes. The older rocks are made up of sedimentary measures and volcanic rocks, most of which have been profoundly altered by regional metamorphision and in many places consist of extensive bands of schists and slates. Undoubtedly this area from its geologic formation is quite possibly the home of deposits of economically valuable minerals; and it is virtually an unknown country — a virgin field for prospecting.

Another section which is reported to be a favorable one for prospecting and in which some claims have already been staked is on the Driftwood River and Tacla Lake. This area is a long way from the railway but the lake and river system can be utilized so as to travel most of the distance by boat.

North of Hazelton the range of mountains drained by the Theguma (Salmon) River is practically unknown country. It is to be hoped that some further prospecting will soon be done in this district.

In concluding my remarks about suitable areas for prospecting, I would like to emphasize that while the mountain ranges drained by all the creeks flowing into the Skeena, Bulkley and Telkwa Rivers have been partially prospected, claims staked and properties developed, that there are still large sections which have never yet been gone over.Taking the map I refer to that country lying between Copper City and Houston.

A Promising Field.

In conclusion it may be said that the North-eastern District at the present time offers a promising field both for mining investment and as a virgin field for prospecting. During the last two years the country has been almost depleted of men with the result that prospecting has almost ceased and also that many promising surface showings have had little or nothing done on them.

It is expected that the return of many men to the country now that the war is ended will result in a general revival of prospecting. Undoubtedly many of the prospectors who enlisted will return to their old occupation, while the free, adventurous life of the prospector, with its promise of possible spectacular returns, will make a strong appeal to many returned soldiers who before the war had led indoor lives. The North-eastern Mineral District should secure a considerable number ofthese returned men who are desirous of following such a life.

This Chamber of Mines can do useful work in assisting such men who are desirous of engaging in prospecting, by intelligently advising them what districts to go to and generally in assisting them in starting out on what will be, to many of them, a new occupation.

Another useful objective of the Chamber would be to form an intermediary between small syndicates and men desirous of prospecting by making arrangements between them along the lines o fthe old 'Grub-stake' system, which did so much to develop many of our older mining camps.

As the foregoing are districts which, comparatively speaking, have been little prospected, it has been thought well to reproduce them in full. Both the North-Western and North-Eastern districts of British Columbia are very highly mineralized and, as will be noted, by the observations of the Engineers, they have great posibilities in a mining way. Mr. Clothier's report in particular when it is borne in mind that the author is a responsible Government mining engineer, might almost be termed glowing and therefore to those interested in the future of the industry in the West is highly gratifying.

Mr. R. W. Thomson.

Mr. R. W. Thomson, Engineer of the Central Mining Survey with headquarters at Kamloops referred to his district as one having a very bright future. He said that while it was the smallest in point of output it probably produced the greatest variety of mineral in comparison with any other section of the Province. He referred to the very full geological reports of the late Doctor Drysdale in reference to some particular areas; dwelt on the recent development of quartz bearing properties situated on Cadwallader Creek and gave some information regarding iron bearing areas in the neighborhood. The latter, he said, was very promising. He spoke, too, of the coal bearing areas of the Nicola-Princeton District which was being largely developed and which last year had produced something over 150,000 tons of coal. His information was that another property was to be opened up and would be in operation in the very near future. While he did not care to definitely commit himself as to which particular sections of his district were best suited for prospecting he asserted that there were large areas which had been very little explored and which he thought would, without doubt, repay investigation. There were also areas which contained properties somewhat beyond the prospect stage in development which would warrant the investment of capital.

Mr. P. B. Freeland.

Mr. Phillip B. Freeland, Grand Forks, B.C., Engineer for the Southern Mineral Survey District stated that the territory covered by district No. 4 was made up in part of mountains which are a part of the Cordillera System which, in Mexico and the United States is estimated to have produced minerals to the value of over $3,500,000 for each mile in length of these mountains. Within British Columbia, he said, the Mountains comprising this system have an approximate length of 800 miles and a breadth of 500 miles. His

district was only a small portion of this expanse, the area being aproximately 6,500 square miles, but the production for the past 22 years would give some idea of the mineral possibilities of the whole country. The production, he said, amounted to the following:

Gold	Silver	Copper
1,420,000 ozs.	6,780,000 ozs.	435,309,000 lbs.
Lead	Coal	
503,000 lbs.	209,000 tons.	

Only a few hundred tons of fluorite had been shipped up to the present time, but the size of the outcrop promised a large tonnage of this mineral. The construction of a mill for concentration of the fluorite was under way at the present time. The cromite deposits had not been thoroughly exploited and their size was unknown. After referring to the Grand Forks and Greenwood mining divisions and their production of copper from large grade ore bodies Mr. Freeland stated that these deposits have been greatly diminished in size and in some cases worked out without any further prospects being developed sufficiently to interest the companies now operating in these two divisions. This, however, did not mean that there were no more deposits to be found, but only that no surplus showings had been discovered up to the present time large enough to interest the companies operating in that locality. It was often the case that bodies of ore are entirely covered by debris and very little evidence of their presence indicated except by a small amount of carbonates. This, of course, was widely known in mining circles and a local case in point occurred at the Monarch Mine in the Phoenix Camp. Here a deposit of 100,000 tons of ore missed having an outcrop by only a few feet and was discovered by a tunnel driven to develop an ore body some distance away. This instance was quoted to show that although the copper industry is on the wane in these two divisions there are yet chances, and good ones, of discovering other deposits.

Mr. Freeland continued:

That this will take patience and effort is probable in the already well prospected localities, but there are many outlying districts that have scarcely been scratched and samples brought in from time to time by prospectors show evidence of the same geological condition that occur in the Phoenix and Greenwood Camp, and which have produced such an abundance of copper, gold and silver.

The policy of picking the ripest plums, is, of course, the most paying, but such a condition cannot last forever and the time will come when districts passed over because they had no apparent large outcrop will be again explored systematically and I hope with gratifying results. In a geological survey report on the Franklin Camp, which is situated approximately 45 miles north of Grand Forks and embraces an area of 16 square miles, the writer of which was the late Mr. C. W. Drysdale, it is stated that the Franklin contact metamorphic ores resemble those of the Phoenix most closely in character and belong to the same Chalcopyrite-Magnetite class. The Franklin occurrences has somewhat similar structural relations to that of the Elk Horn Mine in Montana. The ore bodies are in the crushed dolomote which served as a channel for the ascending solution. There are a variety of gold, silver and copper out-crop in this camp which up to the present time have not been developed to any great extent. **It is a locality that I believe is worthy of further exploration and development.**" Mr. Freeland then referred to the country commencing in the vicinity of the north end of Christina Lake and extending north between the Arrow Lakes and the North Fork of the Kettle River as far as Gallopin Mountain. This is a district which has come to the front recently and its property carry a high grade silver and lead. Further exploration, he said, is warranted on both sides of the main Kettle River and also on the west fork of the Kettle River. Here there were great old crown granted claims which would be worth looking over. These claims have lain idle for years and at the time of their exploration there were few facilities for transportation. Conditions, however, have since changed and, for this reason the speaker thought, that it might be found that some would repay development. He also suggested intensive prospecting along the route of the high power electric lines being built from Greenwood to Princeton, B. C. He pointed out also that the largest producer of gold in his district was the Osoyoos Mining Division, the load gold coming mainly from the Hedley and Similkimeen localities.

In discussing recent developments at Copper Mountain Mr. Freeland said that the highly siliceous alumina content of the Copper Mountain ores, of which there are 12,000,000 tons blocked out made concentration by oil flotation necessary. He said this locality promised to be one of the leading producers of copper in the country.

The sedimentary rocks near Princeton, Coalmont and Tulameen covered an area of approximately 50 square miles, seems of better class lignite varying in thickness were being worked at the present time. Chemical analysis showed that a small area, about 3,300 acres, near Coalmont, contains bituminous coal. This also is being worked.

Brief reference was made by Mr. Freeland to discoveries of Chromite and Platinum in his district during the war. In regard to the platinum he stated that the gravels of the Tulameen River were well known for their production of gold and platinum and that much platinum was thrown away in the early days when the price was low. "In fact," he said, "it was considered a nuisance by the placer miners because its high pacific gravity caused it to mix with the gold. A representative of the munition board sampled the rocks of the Franklin Camp and found that the pyroxenites carried some platinum." He added that indications were that Russia's present known supply of platinum would last about twelve years. After that time, unless some other large field was discovered, another supply would have to be found, which might bring British Columbia occurrences under further consideration and result in the arrangement of some system whereby the platinum and copper ores might be analyzed and paid for by the Smelters.

Concluding, Mr. Freeman said. "The encouragement of the prospectors is a subject which I believe is going to be discussed by others of this convention and I am sure it will receive the hearty support of all interested in mining. During the short time I have been resident Engineer of this District it has been a pleasure to see the keen interest taken by a great many of the prospectors in studying the formations likely to contain minerals. It is in this way that a good deal of assistance has been given. A distribution of samples of ore in the various towns has also helped.

Mr. A. G. Langley.

Mr. A. G. Langley, District Engineer of the Eastern Mineral Survey District, which includes the East and West Kootenay, next delivered a very interesting address on Metalliferous Mining in that section. He dealt very exhaustively on the subject explaining conditions thoroughly in each section from the south to the north. After describing the geology of the district he gave an outline of the principle properties producing gold, silver and copper.

The silver-lead-zinc production of the district overshadowed that of all others and was at the present time the mainstay of the metalliferous mining in this particular section of the country. Dealing with the Slocan Districts in this connection it was stated that a great deal of money had been taken out by various properties in that section. The Standard alone having paid $2,700,000 in dividends, The Rambler Cariboo $500,000, while it was estimated that the Slocan Star produced over a period of 12 years or having a net value of $1,875,372. The Payne Mine, which had been one of the largest producers of the Slocan closed down in 1904. Its discovery dated back, he said, to 1892, and it produced over 50,000 tons of silver lead ore, representing a gross value at that time of nearly $4,000,000. Dividends paid between 1897 and 1904 amounted to $1,438,000. The mill concentrate during 1903 averaged 124.0 ozs. in silver, 67.29 lead. This was given merely as an illustration of the possibilities of that part of British Columbia. Mr. Langley continued, "Among the properties which have undoubtedly made a large earning during the last year or two are the Surprise and Queen Bess. In 1916 Clarence Cunningham took over the Queen Bess which had been idle for a number of years. Large bodies of ore were soon developed and the mine has recently become one of the most important shippers in the district. The Idaho, Alamo, Sovereign, Wonderful, Van Roy and Hewitt and Wakefield have since been acquired by Mr. Cunningham. A 150 ton concentrator embodying the latest improvements in mill design has been erected recently by Mr. Cunningham at Alamo. Since the rocks of the Slocan series have been found to enclose the largest and most profitable silver lead deposits their appearance in other sections of the country are of interest and well worthy of investigation. Although I do not know of any geological survey records which show co-relation between the rocks of the central mineral belt of the Trout Lake Mining Division and those of other parts of the district it is interesting to note that the richest silver lead deposit in this region also occurred in dark carbonaceous and graphitic slates. Large tonnages of high grade ore have been extracted from the Silver Cup, Netty L. Triune and other properties. The ore is galena, blend and tetrahedrite carrying high silver value. As an example, between the years 1901 and 1905 five hundred and thirty-four tons were shipped from the Triune which ran: gold 0.9 oz.; silver 250 to 400 ozs.; lead 33 to 50 per cent."

The Sullivan Mine.

Mr. Langley dealt in detail with the Arrow Lake Mining Division, the Ainsworth district and the Kaslo district touching upon some of the chief properties of those fields. He then turned to the East Kootenay district, referring at the outset to the Cranbrook area and then taking up Kimberley area in which are the Sullivan, North Star and Stemwinder properties. Of the year it produced 30,554 tons of lead ore, 97,976 tons of zinc ore and 4,582 tons of iron pyrites. The Sullivan Mine was staked in 1895. In 1902 the Sullivan Sullivan, he says: "This property is the largest producer of lead and zinc in the Province. During last Group Mining Company erected a smelter at Marysville which closed down in 1908. In 1910 the property was acquired by the Consolidated Mining and Smelting Company and is now considered to be one of the greatest mines on the American continent. For a long time the problem of treating the complex zinc ores prevented large tonnages high in metallic content from being considered of commercial value. In 1918 a satisfactory solution of this problem was obtained and thus many millions of tons of ore previously considered of no commercial value was added to the already large reserve. According to the management by mining and treating this ore on a large scale, they will be able to produce zinc and lead at a profit on any market which exist in recent years, providing the price of labor and supplies falls with the price of these metals. The long added tunnel, which now has a length of nearly 8,000 feet is reported to be in ore and preparations are now being contemplated for extensive improvement with a view of increasing the output."

Dealing briefly with some of the properties on the north fork of Toby Creek in carrying high silver and lead value and with other properties of the Fort Steel, Windermere and Golden Mining Divisions which, he stated, had not received nearly as much attention from the prospector as sections of West Kootenay and that there were many opportunities here both for the prospector and capitalist, Mr. Langley, continued, "It is ridiculous to suppose that the East and West Kootenay have been thoroughly prospected, for such is not the case, as is quite apparent to any one who has travelled the mountains and is familiar with the nature of the country. It is still a young mining country and, providing market conditions remain favorable, we should see an increase in production during the next few years. What we need is more capital and more prospectors. There are still many properties which were successfully operated some years ago now lying idle that are no doubt worthy of careful investigation and in which ore might be developed and worked profitably under existing conditions. For such enterprises as these capital is needed and also for development of new prospects. Again, there are a number of small deposits carrying high grade ore which are not suitable for working on a large scale and which can be successfully mined by two or three men. These properties are often worked under lease and bond and in many cases substantial profits have been made.

Mr. W. M. Brewer, of the Western Mineral Survey District, when called upon, explained that the area included in his district totalled approximately 48,000 square miles in which about 3,000 square miles were taken up by the Straits of Georgia and other Straits and Inlets between the mainland and East Coast of Vancouver Island. He drew attention at the outset to the fact that within this district was the Britannia Mine, one of the most important copper mines of the British Empire, and a monument to the late G. D. Schley, of New York. The district possessed a great diversity of mineral resources, including coal, ores carrying copper and gold, iron, silver, lead, manganese and molybdenite, also limestone for cement, quick lime and flux, marble, building stone, clay, talcose, slate suitable for some of the various purposes for which talc is generally used and

an occurrence of graphite reported on Harbledown Island.

The district's production of coal from Vancouver Island during 1918 he put at 1,666,582 long tons, and the estimated production of copper for the district, nearly all of which came from the Britannia and Marble Bay Mines, at 19,470,760 pounds, of which about 18,000,000 pounds was from the Britannia. The quantity of lode gold was estimated at 5,800 ounces and of silver at 115,120 ounces. All of the precious metals were derived from the smelting of copper ores carrying low values in gold and silver.

He said that the district presented an excellent opportunity for the prospector, but asserted that the prospector must be prepared to tackle a few difficulties. He would have to be accustomed to the water, a fair boatman and know how to handle a canoe and be able to use an axe, cross-cut saw, a rifle and fishing rod. The various lakes, sounds and inlets where the several small bays afford protection and shelter in case of storm provided unsurpassed transportation facilities, as well as excellent fish food. He added: "There is an old saying amongst the coast prospectors that when the tide is out the table is spread. In other words all a man need do is to go out when the tide is low and dig clams and he will never be hungry."

He said that the most attractive sections for prospecting in his judgment were the Coast Range of mountains on the mainland and sections of the west coast of Vancouver Island. After going into the geology of the Coast Range, he referred to some first-class property in that section, dealing particularly with what he describes as the Britannia Belt. As to the rewards obtainable by prospectors, it was interesting to note that, since the original Britannia group was located in 1897 or 1898, the mining company had purchased about 350 claims, nearly all of which were staked by prospectors some years ago. The cost to the company for these purchases was about $1,000,000. The westerly side of Howe Sound, he thought, would be a favorable one for a prospector to explore. The section in the vicinity of Lough Boro Inlet, Phillips Arm, Butte Inlet, Knights Inlet and Seymour Inlet he said, was prospected to some extent about twenty years ago, and a part of the section was then one of the most active portions of the Coast district, but had been neglected since the Dorothy Morton Mine closed down. The fact that occurrences of bornite and chalcopyrite were discovered not very long ago in the mountains adjacent to Wnight's Inlet, suggested the entire section was entitled to further consideration from prospectors, especially when it was considered that an ore which was practically valueless ten years ago is today a commercial asset. "Only recently," he continued, "a prominent operator inforemd me that he expected to see the day when he could successfully mine and treat a copper ore carrying not to exceed 1 per cent in copper provided the extent of the deposit was sufficiently great."

Referring to the best places for the investment of capital in mining, Mr. Brewer mentioned Quadra Island, Texada Island, Lucky Four Group in the Cheam Range, the Big Eye Group near the head of Great Central Lake and the Alberni Mining Division and the Tarmigan Group adjoining the Big Eye. The three last mentioned groups of Mineral Claims, he said, required very large expenditures of capital to develop them, but they all had the ear-mark of promising to develop into such extensive properties as are in favor with the big operators.

Texada Island, he referred to as a promising field for investment. He spoke of the type of deposits on this Island as having been proven to maintain continuity to a considerable depth and stated that other conditions, such as transportation facilities, are as nearly ideal as it could be expected to find anywhere. Intelligent prospecting and the investment of capital also promised good rewards in several other Vancouver Island localities. He said that but little real prospecting had been done on the Island during the past fifteen years. Previous to that time there were about 200 prospectors exploring the mountains on the west coast, but many of these men about the year 1903 abandoned prospecting to stake timber claims and a large number became fairly rich by selling out. Capital was easier to secure for purchasing timber than to develop mining properties, although many of the pioneer prospectors cleaned up good stakes.

Mr. Brewer's address concluded the Monday afternoon proceedings, and in the evening Mr. T. A. Rickard delivered the paper to which reference has already been made, his subject being "Mining as an Investment."

Employes at Trail May Buy Company's Bonds.

With reference to the recent announcement that the directors of the Consolidated Mining & Smelting Company of Canada has authorized an issue of ten-year convertible gold debenture bonds, which action has been endorsed by the shareholders, an interesting statement has been made by Mr. S. G. Blaylock, assistant general manager of the Company which is indicative of the company's attitude towards its employees. He says: "It has been decided to allow employees of two or more year standing to subscribe for these bonds without insisting on the stockholding qualifications. They may have their payments extended over a period of 10 months. The interest charged on back payments will be at the same rate as is paid on the bonds, namely, 7 per cent." It is further explained that when the list of subscriptions was closed at Toronto on February 3rd it was found that shareholders had agreed to take up the entire issue of $3,000,000, but it was decided by the management to accept subscriptions from such employees as desired to take advantage of the offer. Accordingly the list is now open at Trail for that purpose for a limited time. The bonds are issued at par in denominations of $100, $500, and $1,000, and are dated January 1st, 1919, carrying 7 per cent.

Kaslo.

An assay office is being constructed at the Rosebery-Surprise Mill, Rosebery, the old building having been destroyed by fire a few days ago, most of the contents being saved.

Charles Hendrickson, of Howser, has disposed of all his interest in the Red Cloud Mineral Claim, situated on the west slope of Lavina Mountain, one mile from Duncan River, to A. Le Blanc.

E. W. Senff and A. Le Blanc have taken over from W. F. Clarke, of Howser, all interest in the Jumbo Mineral Claim, situated on Lavina Mountain.

P. J. Sheridan, of Nelson, B.C., has given an option to the Nelson Mining and Development Company in respect of the following properties all situated in the Lardo Water Valley; Comstock, Noonday, Silver Hill, White Water, Barker, Rambler, Markwell, Spokane, March, Six Friends, and Volunteer. The utimate consideration is fixed at $60,000, to be paid in installments covering a period of four years.

Mining: An Investment, a Speculation, or a Gamble

By T. A. Rickard.

The Chairman of your Programme Committe told me that the subject allotted to me was "Mining as an Investment." I assumed that he meant the gainful use of money in mining, that is, the making of money through the exploitation of mineral deposits, not other people's pockets. However, I deem it well to start by defining the terms to be used in the present discussion, because definitions are essential to a correct understanding of any subject.

Money can be employed profitably in three ways: Investment, Speculation, Gambling. An "investment" looks to income; the use of the word assumes the comparative safety and stability of the principal. A "Speculation" looks to an increase of the principal; the use of this word suggests the minor importance of interest, income, or return on capital; it assumes not the stability, but the comparatively rapid appreciation of the principal. A "Gamble" involves a risk so large as to require the aid of luck; it ignores interest or income, it anticipates the alternative of a big winning or a total loss.

Obviously, the definition is subjective; it is based upon the expectation of the individual making the purchase. To one man the use of money for a certain purpose is an investment; to another man the same use appears to be a speculation. Similarly, one man's speculation is another man's gamble. Six years ago, Mr. Lloyd George and Lord Reading, then Sir Rufus Isaacs, were persuaded by Mr. Godfrey Isaacs, a brother of the present British Ambassador and Lord Chief Justice, to buy a block of American Marconi shares as an investment, that is, as a steady dividend payer. Three days after, Mr. Lloyd George had bought his shares, they rose so rapidly that he sold them, on the urgent advice of his broker, to whom he was disinclined to listen, because his intention was to hold the stock "as an investment." He was then Chancellor of the Exchequer, therefore he was hauled over the coals for "speculating"; he was charged with a levity of conduct unbecoming the chief of the British Treasury. He replied by saying that when he bought the shares it was his intention to hold them indefinitely, and that the sudden and surprising rise justified him in selling. In short, his "investment" had proved a "speculation." The distinction is in the mind of the purchaser. Similarly, a Boston school-teacher may buy the shares of the Great Wildcat Extended as an "investment," whereas a Wall Street broker recognizes that it is highly "speculative," and a Nevadan mining engineer knows that it is a rank "gamble." These terms are relative; they connect a crescendo of risk; even an investment has a slight element of risk; a speculation has more; a gamble, most. Sometimes a stock is bought on the expectation of a rise; it remains steady for years; it proves to be what is called a "forced" investment. The idea of expectation is implicit; human factor is never absent; we are dealing not with lexicons, but with human affairs.

The other significant word is in "Mines." A mine is an excavation in the earth's surface, from which mineral is extracted. It is not a company, nor the shares of a company owning that excavation. A flippant definition says that a mine is a hole in the ground with a liar sitting on top. A promotor is said to be a man who sells something he has not got, to somebody who does not want it or, if you prefer, a promotor tries to sell nothing for something to a man who expects something for nothing. However, these perversions of honest business do not concern us for the moment; my subject is the reasonable speculation that is based upon the legitimate exploitation of mines. Permit me to remind you that the word "Mine" was used in the language of warfare before it entered that of peaceful industry. It comes to us through the Latin "Mina," signifying an excavation to be used for killing the enemy. The original sense of the word survives in "minatory," meaning threatening. During the war we have heard more of mines in the North Sea than of Mines in Mexico, for example, and you will alow that thosee who have sailed the seven seas had to deal much with speculation concerning mines, and the floating of mines on water, reminding us of minatory performances on the stock exchanges during times of peace. Now, however, we hope soon to forget the derivation of the word, and to interpret it, not in terms of maleficient activity, but of beneficient industry.

You will note that I have chosen "speculation" in preference either to "investment" or "gambling" as being more appropriate to mining. The use of money in mining is seldom an "investment; usually what is meant to be so, affords an example of the triumph of hope over experience. I admit that certain forms of iron and coal mining on a large scale are characterized by such security, continuity, and steadiness of income as to be "investments," but the mining of the so-called base metals or of the precious metals, in which most of you are engaged, does not come within the category. In metal mining the chance of a considerable risk and of a correspondingly large gain is inherent. Some of you will demur, you will point at the Homestead, the Bunker Hill and Sullivan, or the Utah Copper as examples of an investment, as representing a type of security so safe as to be gilt edge, but I venture to say that your opinion is *ex post facto*. You are writing last year's almanac, you are wise after the event. The history of such persistently profitable mines causes you to regard them as safe, because you can retrace their history for 10, 20 or 30 years. You imagine yourself buying into such mines soon after they had undergone preliminary development, and you know that if you had done so at an early date your purchase would have proved extremely remunerative; but I submit that in the early stages of development these splendid enterprises were speculative as is suggested by the fact that these successful ones are a few survivors from the much larger number that were started at about the same time and proved disappointing. I may remind you, to make my point quite clear, that many of the famous mines of the world "broke" those who first attempted to bring them to financial success. If today you were to advise a widow to put her savings in any one of the three magnificent mines that I have instanced, you would, in my opinion, be an unwise councillor, because looking forward, not backward, for 10 or 20 years, they would represent a speculative use of the widow's savings. You might be sagacious in using your own money for such a purchase, because you could take the relatively small risk for the sake of the probably large gain, but the widow would be better advised to buy Liberty Bonds.

At this stage of my argument, I beg you not to be annoyed at my apparently over-cautious attitude; you will find that my conclusions will not depreciate the industry in which you and I alike are so deeply interested. I shall hammer my point home by one further suggestion. You would not be willing to lock up your mining stock in a safe for 5 or 10 years, as you might do with first-class bonds; ;you know that in the course of five years the fluctuations in market value are likely to be so wide as to compel you, in your judgment, either to cut a loss or take advantage of market profit. On the other hand, a mine is not a "gamble," because the risk it involves is not unreasonable; it is diminished by knowledge and experience, it is lessened by the skill you can apply both to the finding and to the treatment of the ore. A miner always needs some luck, of course, but his luck is a friendly sprite, not the grinning devil that sits by the roulette-wheel. Every business involves one or more indeterminate factors, and therefore contains an element of risk. Without risk there is no gain; but a large gain usually involves a large risk. There are people in mining, of course, that take big odds, that like a reckless bet; they are real gamblers, even if they are unaware of it; but the risks taken in legitimate mining are under some measure of control, they are met by scientific knowledge and by trained intelligence. A blend of pluck and judgment is required. You will recall a line in Bipling's poem, "The Merry Gloster": "And I took the chances they wouldn't and now they are calling it luck." That is why I insist that mining, properly conducted, is not a gamble. On the other hand, no man of experience in these matters would expect to escape all the risk. The idea of eliminating risk from mining is both contrary to the spirit of the business and false to the history of it. To understand mining—to appreciate the principles guiding legitimate and successful speculation in mines —which is my subject—you must revert to the old Cornish word for shareholders; they were called "adventurers," that is, men willing to make a venture.

Indeed, the idea of avoiding the risk in mining is a pathetic fallacy; a puerile endeavour to escape the inevitable. The attempt to find mines that would involve no risk to the capital sunk in them has tended to cripple the industry; the refusal of sundry so-called exploration companies to incur risk has stultified their operations and paralized development. And I may add that this policy has warped the judgment of some otherwise brilliant engineers. The story is told that Marcus Daly sent a mining engineer on a scouting expedition; he examined many prospects, without finding anything worth while. Daly became impatient; he slapped the engineer on the shoulder and exclaimed: "For God's sake, man, go out and spend some money." There is too much of a desire to play safe by buying mines of large blocks of proved ore, and to make money by means of an enlarged scale of operations, increased skill, or improved methods of metallurgy. The finding of ore, which is the real adventure, is relegated to the background; it is not only the chief attraction of mining, but the one that wins the greatest reward. When the ore reserves of a mine are at a low ebb, it may be the most speculatively attractive time to buy the property. There are those who say that the mining of the future will be the economic harvesting of known ore deposits of low grade, the beneficiation of masses of mineral already discovered, but heretowore regarded as too refractory for successful metallurgic treatment, that is, the utilization of the visible supply of skimmed milk instead of the finding of the metallic cream concentrated by the patient operations of nature. I doubt that; the world is still young, and but half explored, as is suggested by such discoveries as those of Nome, Cobalt, Porcupine, Tonopah, Goldfield, the United Verde Extension, the Baldwin Mines in Burma, and a host of other bonanzas during the last 20 years.

One does not need to be venerable in order to recall great changes in the philosophy in mining economics. In 1905 I published a book on this subject, in which was included a discussion upon various aspects of mining finance. Among those contributing, besides myself, were H. C. Hoover, J. H. Curle, and W. R. Ingalls. Mr. Curle, at that time the leading London authority on such matters, a man of wide travel and stalwart independence of mind, advised his countrymen to stick to gold mining as being the safest, because gold had a "fixed value." We know to-day, by unpleasant experience, that gold can so depreciate in terms of other commodities that the gold miner is placed at a decided disadvantage. Mr. Curle insisted that the only correct kind of gold mining was based upon a careful estimate of the ore in reserve, and that at least 60 per cent of the price of the mine ought to be represented by a net profit from the developed ore. He even went so far as to lay down the rule that gold mines should yield 10 per cent on their market valuation. Later he put the interest at 15 per cent. We have travelled far since then. Most of these *obiter dicta* served a purpose in their day, 15 years ago, as a means of educating the British shareholder, who is a simple-minded person, because Mr. Curle accompanied them with much straight information and trenchant criticism, but all such attempts to compress mining into a formula are a failure. They were based largely on the experience—then incomplete—of the Rand, in South Africa, where continuous beds of gold-bearing conglomerate were being exploited on the largest scale known to the modern world. These beds of "banket," as they were called, after the Boer name for almond-cake, were comparatively uniform in their gold contents, and were mined and milled so cheaply as to yield handsome profits. Their uniformity of grade and persistence in depth caused them to be regarded as a basis for "investments" of the safest kind, suitable for widows and orphans. Later experience has shown that they were neither so uniformly nor persistently rich as had been expected, the result being to turn the "investments" into "speculations" out of which a comparatively few made a great deal of money and comparatively many lost more than they could afford. The Rand proved to be the greatest gold field in the world, in extent and in yield, but I am making the point that it did not escape the vissicititudes latent in mining, and the successful effort to persuade the public that it would escape those vissicititudes led, in the end, to a tremendous and widespread loss of money, which passed from the pockets of the public to those of the promotors. Money made honestly on the Rand during the development stage, when adventurous spirits risked a total loss of their stake in order to make a big gain; but when the operators and promotors turned to this man of small means and persuaded him that the latent risks were eliminated, and that a gilt-edge investment was available to him in the stock of over-capitalized mines, they deceived him. Some of the operaors and promotors knew no better; others were advised by good engineers, and simply vicitimized the unsuspecting by unloading their holdings upon them at a handsome premium. To illustrate how the public was victimized, I can state that the market value of the shares

in the principal companies representing consolidations of groups of mines declined $203,931,610 between 1911 and 1918. That huge loss was due to ignoring the common experience, that mines become impoverished in depth, just as surely as men grow old, and also to the assumption that a 60 per cent ore reserve, that is, having 80 per cent of the market value "in sight," furnished ample security. In the attempt to introduce one or two academic factors of safety, the public was led to ignore the very essentials of the business, namely, that it involved no small risk, under the best conditions, and that the risk must be compensated by large dividends. Instead, the public accepted 8 per cent, or 7 per cent as an added freight return and failed to recognize that they held a wasting asset. During the speculative—the frankly adventurous—stage of Rand mining made money for nearly everybody engaged in it, but when the chicanery of the few was combined with the ignorance of the many into creating a false notice that the speculative phase had been transferred into one of secure investment, then it was that share-dealing on the Rand became a cause of great loss to the public and a blot on honest industry. From the moment when the change in sentiment was effected, and the fallacy was established, the mining of the gold became less profitable than the mining of the pockets of the public.

This investment idea, of minimizing risks and limiting possibilities, would soon cause mining to die for want of breath. Before a proftable outcome is assured every mining enterprise must pass through several stages of speculativeness, as surely as a child must take the chance of bumps and bruises, or measles and mumps. The biggest fortunes are made during the early stages of development; on the whole, more money is made by selling than by buying mines, simply because the final, or so-called investment, stage of a first-class mine is likely to represent an over-valuation, caused by an erroneous supposition that the essential hazard is precluded. I would even say that more money has been lost by the over-valuation of the great rich mines of the world, like the Con. Virginia, Mount Morgan, Broken Hill, and Nipissing, than in a multitude of worthless prospects. Shall men lose their money in big mines, and big men in small mines. The inference, therefore, is not to try to get rid of the essential risk—because it cannot be done—but to require a rate of profit proportionate to it. A much more intelligent policy is to engage in such mining as allows a liberal margin both ways, taking a larger risk for the sake of the larger gain, that is, to speculate with eyes wide open and not to invest with eyes half shut.

Fifteen years ago the careful sampling of ore as a means of valuing mines was becoming advanced to an art and the tendency was to place great reliance upon it, with the consequence that capitalists began to think themselves safe in buying ore. They thought to escape the essential risk by assuring themselves a return of their money, diminishing the speculative features of the business as much as possible. Exploration companies were organized in London, New York, and Boston to scout for promising mines on which to apply the newly developed methods of valuation. Most of these seekers after bonanzas were disappointed; they failed to repeat the successes of the pioneers in this type of mining finance—such as the exploration company of the Hamilton & Smith era—because they were too timid; they expected to have their money in sight when they bought a mine; they were looking for a bet on the sure thing, with all the profits of a speculation. They lacked the temperament needed for adventure and should have placed their money in a bank where at 4 per cent it would double itself in fifteen years. Many directors of these exploration companies bluffed themselves into the idea that they were bold navigators when, as a matter of fact, they were only fair weather sailors.

As I remarked at the time, "ore-reserves are not everything; expansion and development are the essence of successful mining." The big successes have been made by developing prospects into mines, not by buying blocks of ore that had been exhaustively sampled by meticulous young men. The profit to be made must depend upon the further extension of the ore; the larger the proportion of ore already proved the smaller the possibilities beyond. As Mr. Hoover pointed out, the probable depth of extension is more critical than the proportion of profit in sight. He worked out a rough rule for the Gold Mine of Western Australia, namely, the minimum extension of an ore body in depth should be not less than one half its length. He called it a "yardstick" for use in forming a judgment, but he laid stress on the need for investigating the characteristics of the individual ore body, more particularly its geologic structure and that of the district in which it lies. Such a rough and ready formula, however, would fit only the mines that are dependent on one or two large shoots; it would be of little service in the valuation of mines, depending on a series of recurring ore-shoots, as, for example, the Goldfield Consolidated, in Nevada, the Nipissing, at Cobalt, the Yoquivo in Mexico. Mr. Hoover made the shrewd observation that "the quantity of ore in reserve is a matter of management, not necessarily dependent on the size of the mine."

In 1912 Morton Webber protested against the use of formulas in mine valuation and showed that "the relative magnitude of ore reserve in any particular mine is largely a matter of administrative policy." I myself remember, when practising as a mining engineer, advising a client not to extract the ore in his mine if he hoped to sell it to advantage, as he wished to do. The extension of the ore-body was menaced by a fault. He listened to a saw-mill engineer, enlarged his mill from 20 to 40 stamps, extracted all the ore, and barely made enough profit to pay for the enlargement of the plant, leaving a hole in the ground in which several later operators have buried their good money. This was a gold mine in Idaho. Another example occurs to me: a small silver mine in Colorado; ore was only 5 ins. wide, but high grade. A careful sampling showed $150,000 worth of ore assured, which would yield a net profit of $110,000. The owners were willing to sell for that sum, half cash, and half in six months. I advised my clients not to buy, because the winzes below the adit-level showed that the vein was poor and much faulted. The history of neighboring mines was not promising as to prospects in depth. I considered the business unattractive because the risk of the known ore yielding less than the amount of profit estimated seemed to outweigh the chances of finding more ore, the subsequent story of the mine justified my opinion. On the other hand, I advised the purchase of the Camp Bird, in Colorado, for $6,000,000, when the bottom workings looked poor, and gave no promise of the ore persisting, because I believe that horizontal exploration would lead to the uncovering of more ore bodies, especially Westwood, where the rising surface gave virgin ground increasing to a height of 1,200 ft. above the adit. The mine had reserves equal to $6,118,000 gross, but the value of it lay largely in the good prospects of the further finding of rich ore,

without sinking, as the sequel proved, for the Camp Bird has produced $20,000,000 since then, although poor in depth. Please pardon these reminiscences of a time, 20 years ago, when I was a mining engineer, not a journalist; I give them because personal experience is direct evidence.

In 1911 M. H. Burnham contributed a series of articles on sundry principles underlying the finance of mining enterprises, more especially the "risk rate." He insisted rightly that the buyer of mines or of shares in mines should expect not only a bank-rate of interest on his capital, but as much more as will cover the additional risk inherent in the business of mining. If, as I suggested at that time, he bought into the Goldfields Consolidated, in Nevada, then the most productive gold mine in the world, but with a reserve of ore so small as compared with its annual production as to insure the return of only a small part of the market value, he, the sane speculator, ought to expect a dividend of 35 per cent per annum, or 31 per cent more than the four per cent bank rate, that is, the mine should be valued on the basis of a three-years' purchase. This famous mine is now in the hands of lessees; its story has been told, and you can ascertain how nearly right was my diagnosis of the position. However, it is only mentioned as an example. On the other hand, a mine like the New Modderfontein in South Africa or the Homestake in South Dakota might show a life and a standard of production justifying a low estimate of risk, thus warranting a much smaller return, say, six per cent more than the bank rate. It amounts to this, that after an engineer has examined a mine and measured its ore-reserves, he must determine the risk-rate at which his clients' capital may be used in the purchase of that particular property. This risk-rate will be based upon the past history, the present condition, and the future prospects of the mine.

The sampling of mines has been allowed to obscure the need for good judgment. It is also another phase of the attempt to make an investment out of a speculation. The ore in reserve in a mine should be regarded chiefly as an indicator of the probability of being able to find and develop more ore of the same grade. The expectation of a profitable venture should be based not upon the attraction of the known ore, but upon the chances of further intelligent search.

A so-called five per cent investment in a metal mine is an unwise use of money, because the interest is too small for the risk, whereas a 20 to 25 per cent speculation in a metal mine is sagacious, if the probable risk is compensated by the probable gain. As Mr. Hoover says, "there is an inherent speculation in mining, and it is this speculation that attracts." It attracts those that understand. It is the spirit of adventure that stimulates the best kind of mining. For instance, the controllers of the Homestake mine have spent 15 million dollars in 15 years on the Corro de Pasco; they have received their money back and 100 per cent additional thereto, equal to about seven per cent in the 15 years, and now they have proved ore sufficient to last for 20 years. This is what I call a fine adventure!

The speculative side of mining has an attractiveness that is at the bottom of the energy with which it is followed, and when you bring it to the dead level of a steady investment you will find that the man of ordinary shrewdness saves time by going straight to his broker and buying bonds or consols. This does not mean that one is justified in playing the fool and expecting miracles to happen. The risk of mining should not be increased needlessly by human abhorrency. Mining enterprises come to grief often not so much on account of the failure to attain an investment basis, but because they are not put on a business basis. Even if the occurrence of ore in nature be erratic, and mining as a consequence be hazardous, there is no justification for piling human foolishness on top of natures' vagaries.

A large part of public participation in mining is done by means of share-buying; this is a secondary and less desirable form of speculation, as compared with the ownership or part-ownership of mines by individuals, partnerships, or small syndicates. It is a legitimate means, however, of distributing risk and of applying collective capital to undertakings too burdensome for an individual or a syndicate. It produces a fluctuating ownership. In practice, whatever may be his theory, the American "investor" does not buy mining stocks to keep. Whatever he calls such holdings, he treats them as "speculations" he does not put them away for the sake of their dividend yield; he is always ready to realize upon them at an enhanced price; he buys them to sell. It has been said that the ownership in an American mining company changes, on an average, every five years. Hence the mysteries of amortization do not interest most of the people. They are looking for a quick turn-over, not a long-time investment. The individual owner of a mine rarely keeps it when it grows to a size involving a large amount of capital; he spreads the risk and gathers his winnings by disposing of the mine in a public company. Long continued private ownership of a profitable mine is rare. W. B. Bourn and his father before him have controlled the Empire mine in Grass Valley, California, for 50 years, and I may add that this mine has been worked uninterruptedly for 66 years. It has proved a real investment, although started, of course, as a speculation. I venture to say, however, that if anybody were to buy it to-day on Mr. Bourn's valuation, or on that of an equally competent appraiser, he would be compelled to take it as a "speculation," for the simple reason that the odds are largely against the Empire mine continuing to be worked profitably in the future for any such length of time as in the past.

Of well conducted mining ventures it can be said that they meet with a measure of success as large as, if not larger than, an ordinary manufacturing enterprise. I make no apology for mining, it has been—and still is—a glorious adventure for the youth of the world, for those young in spirit as well as in body. To mining we owe the exploration of the far corners of the earth and the development of it waste places. From the days of the Argonauts to that of the beach-diggers of Nome the call of adventure has caused men to go forth into the wilderness and prepare the way for the establishment of industry, for the extension of civilization, for the making of homes, which is the best fruit of human toil. If we stifle that spirit of adventure between formule, if we suppress it by maxims of an unreasoning caution, we shall shrivel a great industry into a picayune trading that will commit suicide in due course.

No; risk is the very essence of mining; it is its life, and the true miner faces the risk with the cheerful confidence of the men that make the world more spacious "in the time of great Elizabeth," of the Ar-

gonauts of the Golden Age in California, of the trappers and *coureurs du bois*, who opened up the great northwest.

Mr. H. N. Lawrie.

On reassembling on Tuesday morning Mr. S. S. Fowler, of Nelson, B.C., took the chair and called upon Mr. H. N. Lawrie, Chairman of the Oregon Bureau of Mines, Portland, Oregon, who spoke on the subject "Gold." His address was exceedingly interesting and the information he gave, coming from a man who knows what he is talking about, was very attentatively followed. In view of its importance it is reproduced in full as follows:

Government Control of Smelters.

The program next provided for an address by Mr. Sydney Norman, Editor of the Northwest Mining Truth, Spokane, on the subject "Government control of Smelters." Mr. Norman introduced his remarks by explaining that he did not wish it to be taken that he was attempting to impose his views upon any of the delegates present. He pointed out that he had addressed the International Convention at Revelstoke last year on the same subject and his remarks had been characterized as insidious and lurid. It had been added, too, that British Columbia did not need the advice of Americans to conduct their business properly. "I do not blame them I am sure," said Mr. Norman, "still I believe that it is only by the experience of others that any nation or any people can select that which is best for its own interests."

Continuing, he said, that he could not give any definite information regarding the commercial advisability of establishing any kind of a smelter on the southern coast. That would have to be decided by a thorough canvass of the ore situation. He would assume, therefore, that the necessary supply of ore is readily available and that location of a smelter and refinery upon the coast where British Commerce can be maintained economically with the Orient would insure a market of the first magnitude in extent and monetary returns. If that assumption is correct, he emphatically declared, that such a smelter should be subsidized by the Government. Such a subsidy should not, however, be given to bolster up a more or less problematical venture, but as a return for Government Supervision of rates so that the producer of ores might be for all time assured of a fair return for his labor and his capital. He declared that he was not in favor of Government ownership which, in his opinion, was merely another expression for wanton waste. Government regulation, however, was a different thing, "but again," he said, "I wish to qualify by saying that a regulation must be as unrestricted as possible, always keeping in mind that the smelter is as important to the mining industry as the producer and that, until both are satisfied by a spirit of mutual confidence, neither can prosper to the limit warranted for instance by the great mineral wealth of this Province."

"Speaking still emphatically I cannot see any argument," he continued, "against proper Government regulation that will guarantee to the producer a fair share for his labors and the smelter a fair return upon the great capital necessary to the success of any such venture. If a smelting company be honest in its methods and its settlements and for the purpose of this discussion we may assume that smelters in British Columbia are unlike some prototypes on the other side of the line, then there surely can be no objection on their part to a fair impartial regulation that will forever remove the most prolific cause of dissention and distrust. If, on other hand, there should be smelters that do not conduct business with due regard to the broad interests of this Province — and that means full encouragement of the producer — it is time the conditions were changed that the Province may come fully into its own in the mineral producing way."

Mr. Norman asserted that British Columbia possessed the best mining laws under the sun and he thought it was logical that its Government should take the lead in settling the smelting question in such a way that would lead to a much better understanding between shipper and smelter and thus increase the volume of its mineral production. He went on to deal with the Trail Smelter saying that the former spirit of co-operation and mutual trust between that Company and its patrons had given away to distrust and bickering. Smelter officials contended that the rates now in force were as low as could be granted under the rules of good business while the shipper asserted that he was not getting a fair share of the proceeds of his work and his capital. This, the speaker said, clearly proved the necessity for some regulating force that would remove the cause of friction that militated against full development of interior mining districts and would continue to do so until the shippers felt that there was some final court to which they might appeal in cases where injustice had occurred.

Mr. Norman proceeded to deal with general conditions on the American side and in Canada in respect to the smelting industry. He asserted that it was folly to suggest that Canada could disassociate itself with what was occurring in the United States in regard to this matter. The interests of the two were closely co-related and there was no escaping the fact that, as smelting corporations, whether on the American or Canadian side, work closely together, what might be done south of the imaginary line was bound to make its influence felt to the north. Touching upon a few of the arguments which he had heard advanced against the proposed proposal of Government regulation smelters Mr. Norman said that they amounted to nothing and that in point of fact there was no logical reason why the present unsatisfactory condition should not be improved in the manner indicated.

Concluding Mr. Norman said, "The world is on the eve of great changes and I submit that smelting corporations will be untrue to the best interests of the people and remain contributors to a condition of unrest that has hindered development in the past if they refuse to give these arguments consideration. We are at the parting of the ways on the threshold of a new and better era."

"The corporation that refuses to sense these changes and fall in with march of progress might easily find itself engulfed in a wave of Government ownership that will sweep it out of individual existence forever. The leaders of industry who realize the situation and go forward to meet it with the single purpose of advancing the best interest of all the people will erect greater monuments than those who refuse to be swerved from their sole purpose of wringing money from the public. I honestly believe that Government regulation must come sooner or later and that wisdom dictates adjustment to changed conditions without delay.

The Better Preparation and Utilization of Coal.

"The Better Preparation and Utilization of Coal" was the next paper presented. It was given by Mr. G. W. Evans, Coal Mining Engineer, North West Experiment Station, U. S. Bureau of Mines, Seattle. He stated at the outset that his remarks would not be specifically with regard to the bituminous coal of British Columbia. As, however, the coal of this character in the State of Washington was similar to that of this Province the problems confronting the people of the two countries in this respect also were similar. His plea was for the greater use of the smaller sizes of coal, largely disregarded by both producer and consumer. Coal operators in both British Columbia and Washington knew that the percentage of large sizes is decreasing and the quantity of small size coal is increasing. This change, he said, had been brought about partly by the inferior class of coal miners of to-day compared with former years. To-day some of the coal miners particularly in the State of Washington knew only how to drill a hole and fire a shot, some did not know even how much powder should be used. The result was that the coal is shot into small pieces and in steeply pitching coal beds the coal is further broken up by falling down the chutes. It was therefore necessary to face the inevitable fact that the percentage of lump coal will decrease and the small sizes are going to increase as time goes on unless new coal fields are discovered. It behooved us for these reasons to make preparations to save more of these smaller sizes and offer them to the public in the cleanest possible condition. To separate impurities from the coal in the smaller sizes was a more difficult matter than to clean the coal of larger size. In the anthracite coal fields of Pennsylvania dry cleaners were used for the smaller sizes and, at one bituminous mine on the Strait of Washington, a spiral separator was tried with only partial success. It has been found, the speaker asserted, after years of experimenting that treating the coal in a liquid thus taking advantage of the difference in specific gravities between the coal and its associated impurities is the only practical way of making a proper separation. Experience, he said, has taught that, in order to get the best results in the washing of coal, the washer should be of proper design properly adjusted and operated. He had seen plants where tubs appeared to do pretty good work, but for a new plant would not recommend the tub except in an emergency. Mr. Evans proceeded then to describe some of the coal washing plants that are now being built and after describing the various methods of their operation declared that to get the best results a thorough study should be made of the coal to be washed and the type of jig installed that would best suit the purpose. Such studies and designs should be studied by someone competent to make such investigations. He did not advise ordering from a catalogue, suggesting that the operator should take his coal washing problem to a specialist and ask for a guarantee so that the resultant product would measure up to certain specifications. In this connection he said, "Our coal washing plants are being built with more refinements each year in order to successfully meet the requirements exacted by more complex coal and an effort to practice true conservation."

Mr. Evans recommended that operators should pay more attention to the efficient operation of their jigs. Very few could tell what results they were getting, and little did many of them realize that the amount of good coal going to waste or the percentage of absolute waste in the wash product can be determined by a proper study with a "float-and-sink" machine, and the necessary corrections made in the jig. Briefly outlining the manner in which this work is done, he said: "Samples are taken every thirty minutes for a period of eight hours at different parts of the plant. Careful head samples are taken of the material going into the washery; also samples are taken at each of the refuse discharge gates of the machine, and as the washed product passes over the conveyor from the jig, it too, is carefully sampled. Next day each of these samples should be treated about as follows: The original samples should be coned and quartered—care being taken not to break the particles in the sample—until a representative sample of about 40 or 50 pounds is obtained. This smaller sample is further quartered until the required size sample is secured, which is to be used in the "float-and-sink" machine. The machine is then filled to the required height with a solution of zinc chloride of the proper density. This particular density is called the permissible bath for the coal under consideration, and might range from 1.35 to 1.65 specific gravity, depending on the amount of adherent ash in the coal and the amount of ash the coal market will assimilate. The head sample is then run through the machine. The marketable product will float, and the refuse will sink. Each part is weighed and in this manner the percentages of each are determined. The results obtained on the head sample indicate what the washers should produce if they are working at an efficiency of 100 per cent. The "float-and-sink" machine, by the way, is assumed to be a 100 per cent efficient separating machine. The refuse is treated in the same bath, and if the washer is doing perfect work, there will be no float, and in treating the product there should be no sink. This seldom happens. The percentage of float in the refuse and the percentage of sink in the product are used as factors in determining the efficiency of the coal washer. By making these determinations adjustments of the length of stroke of the jigs and experiments with the sizes to be treated to get the desired results can be made. The man who operates the jigs will more clearly understand what is required of him and the machine he is paid to operate.

Quoting from a bulletin published by the Commission of the Conservation of Canada on the Conservation of Coal in 1914 Mr. Evans enumerated the equipment of which the principle collieries of British Columbia were provided in respective washers at that time. He pointed out that the same authority estimated that the cleaning losses are as follows: Hosmer Mine, no loss because small size is coked; Nicola Valley Coal and Coke Company, no estimate; at the Western Fuel Company's Mine, the sludge and other unmarketable coal is used under the Company's boilers and in the Northfield Mine of the same Company, it is estimated that the sludge loss is 2%; at the Vancouver Nanaimo Company's plant the coal less than one quarter inch was wasted, no estimate was made as to the amount. There is fifteen per cent. of the output of the Fiddick Mine of the Pacific Coal Mines, Limited, that is wasted; at the Extension Colliery of the Canadian

Colliery Company it is estimated that about 34% is wasted in bone and slack and at the Union Washery of the same Company there is a waste of 24%. "Of course these percentages," Mr. Evans said, "do not all represent clean coal, but it is safe to assume that between 5 and 10% greater recovery could be made in treating the Nicola Valley and Vancouver Island coal if crushers were used on the larger impurities such as bone and coal and shale from the picking tables and the middlings from the jigs and the crushed material either treated on tables or in jigs; and if the bird's-eye or sludge now being wasted were treated on properly designed tables these are features well worth considering very carefully. A seven per cent. saving on the coals for these two fields would probably equal 140,000 tons, which in itself is worthy of an effort.

"At one plant in the State of Washington using a well known jig I personally saw 80 lbs. of white rock picked from seven tons of coal that was supposed to have been cleaned by that jig, yet the Company, which was paying a man good wages to attend to the jig, wonders why the people of Seattle complain at the amount of impurities in the coal. Let us have more study and education along this line."

"Until recently we were satisfied to let the refuse from the jigs go to the waste dump without further thought; to-day many of the progressible Companies are crushing some of the refuse and all the middlings and treating them either in another jig or on properly designed tables.

"Also until within the past few years little thought was given to the waste water and smaller sizes usually called bird's-eye or sludge, but at present in some plants the waste water along with its load of small coal and associated impurities are conveyed to a settling tank and from the settling tank are fed to properly designed concentrating tables. The tables generally used are what might be called nephews of the old Wilfley table, familiar to ore dressing engineers. As a rule the riffles used are higher and the surface of the table is differently arranged.

"A coal cleaning plant operating along most modern lines does not waste very much except the color in the water. Probably some enterprising engineer will attempt to recover the color by means of an Oliver filter."

Mr. Evans stated that coal operators might ask what was the use of all this refinement in coal preparation and saving of small sizes when they were unable to dispose of one-half the small coal on hand. This lead him to the second part of his paper under the heading, "The Better Utilization of the Small Products from the Washers." He said that the product of such a field as that of the Crows' Nest gave rise to no problem because the smaller size can readily be used in making coke. It was different, however, with non-coking, bituminous and sub-bituminous coals.

Continuing he said, "In many of the large steam plants mechanical stokers of some form are in successful operation. They burn the small sizes efficiently with little or no smoke given off. The ash formed is disposed of mechanically. In fact, everything goes along pretty well in a very large plant, but only the larger plants can afford to install mechanical stokers. In the smaller plants where the installation of large stokers is not justified because of the expense the boilers usually are fired by hand. In plants where the expense of installing large mechanical stokers is not justified or even where justified in some instances powdered coal equipment is now being installed. To-day we find that pulverized coal is being used in many steam and heating plants of some cities. Several large buildings in Seattle have recently replaced California fuel oil with powdered coal and, according to the statements of the engineers in charge of those plants they like the powdered coal best.

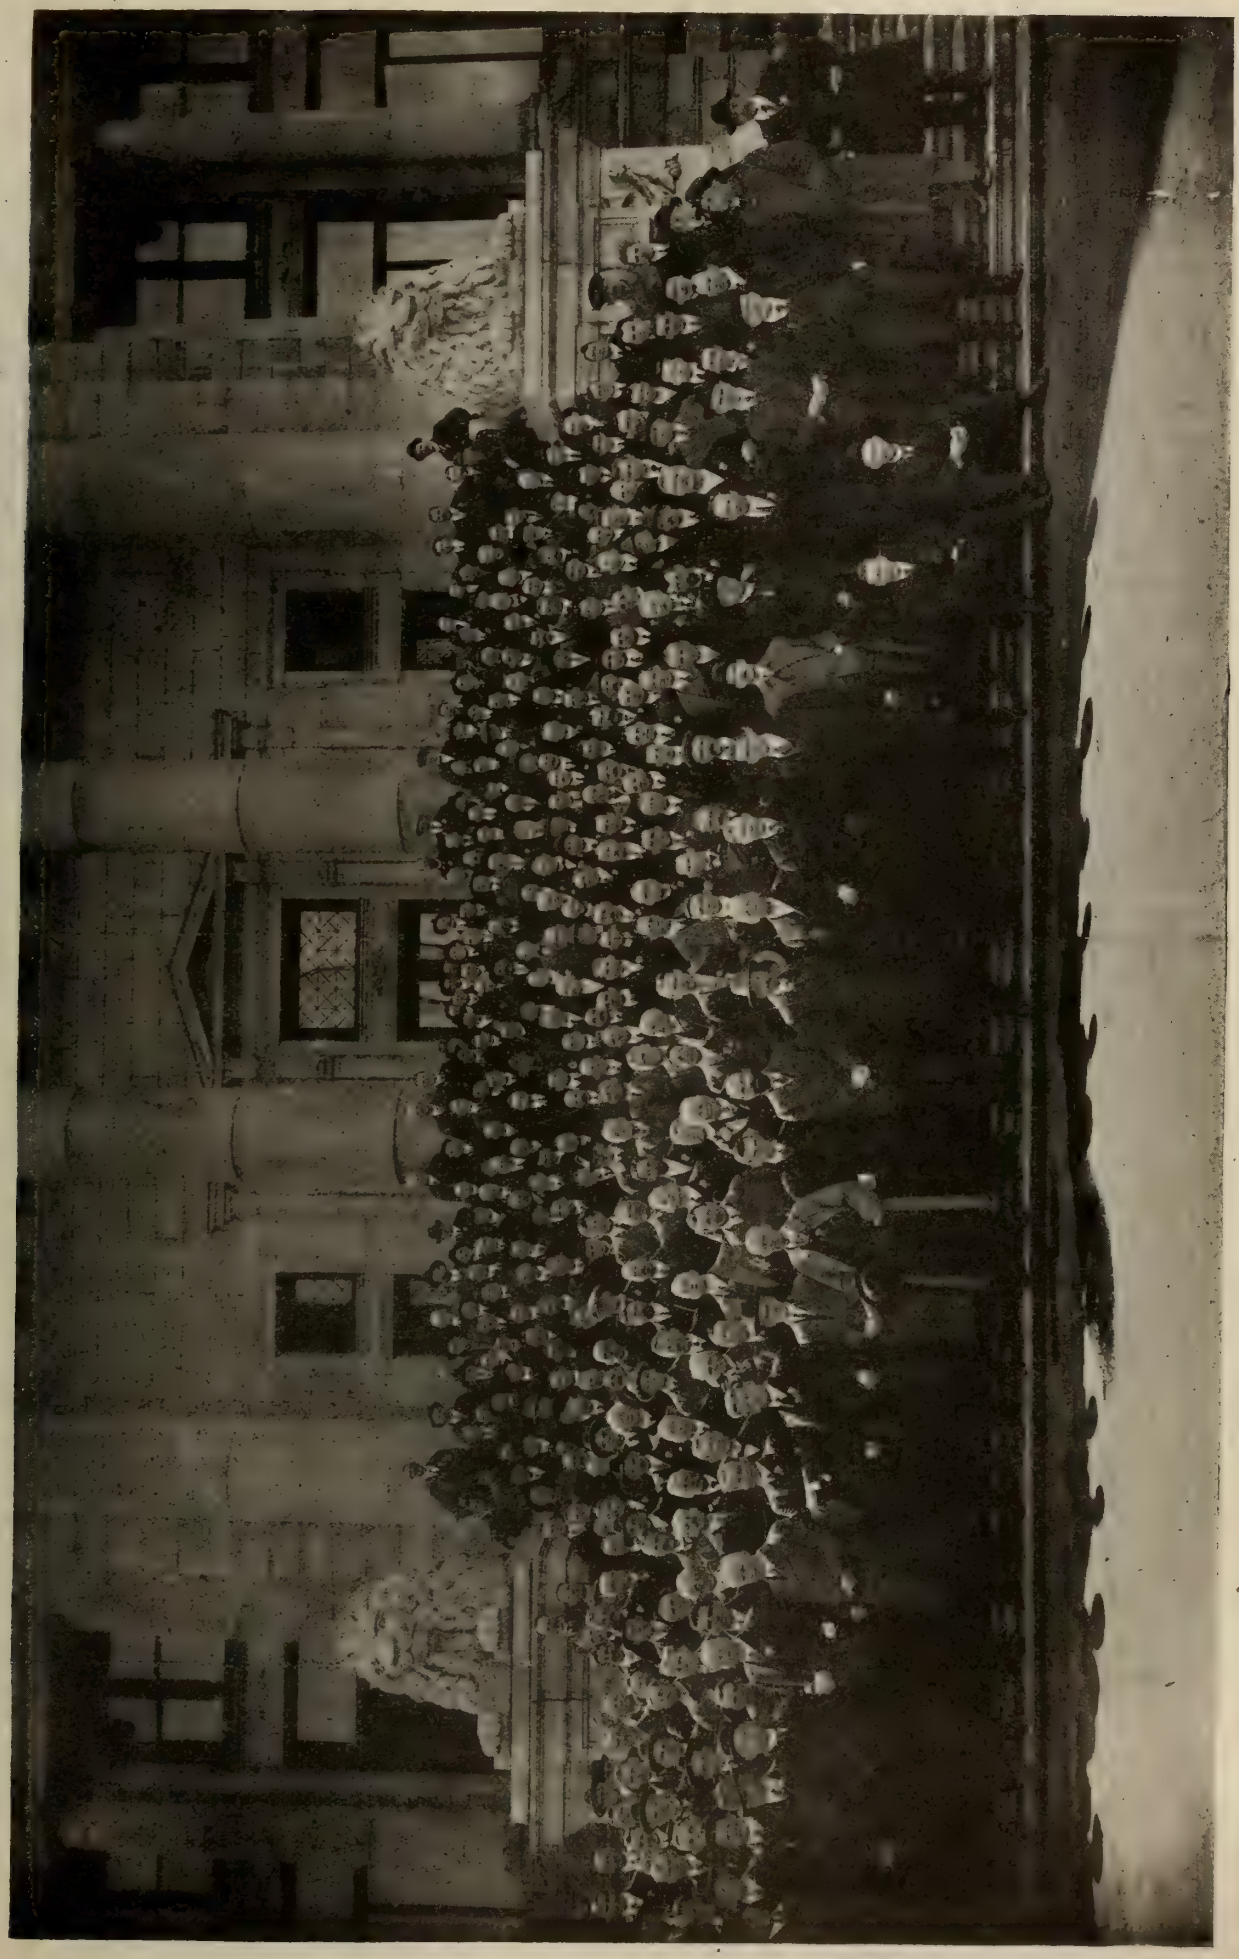
The speaker proceeded to enumerate some of the powdered coal installations in the State of Washington, mentioning the Western Avenue plant at Seattle, the Puget Sound Traction Light and Power Company and describing equipment. The coal was ground so that 95% of it will pass a 100 mesh screen renton buckwheat and bird's eye or sludge is used. "In this connection," Mr. Evans stated, "it might be well to mention the fact that at the Renton coal mine the Company years ago was forced to dike their bird's-eye and not allow it to go into the streams with the waste water because of protest from the neighboring farmers. To-day they are loading coal from the pile of 160,000 tons saved by means of a drag scraper and utilizing it in their Seattle Powdered Coal plant. This is a plan that others might follow to their advantage." Other installations mentioned were the Superior Portland Cement Company's plant at Concrete, Washington, that at Briquettville, Washington, where the powdered coal used in some of Seattle's largest buildings is pulverized; that of the Pacific Coal Company at the Black Diamond Coal Mine. At Black Diamond, he said, the smallest sizes of the black diamond coal are used which is non-coking bituminous; at the Coal Creek plant of the same firm they were using the smallest sizes of the sub-bituminous coal of the Coal Creek mine; at Briquettville they were using a mixture of Black Diamond-Coal Creek and the coking bituminous coal of the Burnett Mine.

The following well known buildings of Seattle, it was stated, are using powdered coal; the Seattle Natatorium or Crystal Pool; New Richmond Hotel; Broadway High School and the forty-two story L. C. Smith Building. The air pressures used at these plants ranged from two to three pounds and the pulverized coal was hauled to Seattle in five ton air-tight tanks from Briquettville, a distance of twelve miles.

Mr. Evans followed with some notes taken from a detailed report of a twenty-four hour test made during February, 1919, on a Babcock and Wilcox boiler of 600 H.P., which during the test had a rating of 125%. Without going into the details he quoted a few of the economic and efficiency results obtained:

Water fed per pound of coal fired	8.50 lb
Water evaporated per pound of dry coal	8.35
Equivalent evaporation from and at 212°F per pound of combustible	11.30
Calorific value of one pound of dry coal	11,660 B. t. u.
Calorific value of one pound of dry combustible coal	13,700 B. t. u.
Efficiency based on coal fired	78.95%
Efficiency based on combustible	60.05%

Continuing Mr. Evans said that there was quite an accumulation of slag on the slooping sides of the furnace which is removed at intervals of one to two months when it has accumulated to a thickness of six to twelve inches. The ash also accumulated in the boiler tube was removed by the aid of a soot blower.



International Mining Convention, Vancouver, B.C., March 17-19, 1919.

The condition of smoke was very light; there was no back lash; the best effect on the brick works was not noticeable; there was no pulsation and it was the opinion of the engineer who made the test that the results were very satisfactory. The coal used was screenings from the Issaquah Mine of the Pacific Coast Coal Company which is sub-bituminous.

Dealing with comparative costs of fuel oil operation with powdered coal, Mr. Evans quoted some observations from a book written by Mr. C. F. Harrington, mechanical engineer, on the use of powdered coal. After giving statistics the speaker pointed out that the conclusion was that, with fuel oil at $2.00 per barrel and washed bird's-eye coal at $2.50 per ton there is a marked saving in favor of powdered coal.

"For the smaller apartment houses, hotels and small steam plants that cannot afford to install either the large mechanical stoker or the powdered coal equipment some other provision must be made. This field of fuel consumption appears to be well taken care of by a mechanical stoker invented in Seattle within the past few years which is known as the American Smokeless Stoker or Burner. This stoker works automatically. It is of the under-fed type and is designed to be used where the amount of coal consumed is not as large as in a large steam plant. A coal bin connected with the screw feed of the stoker is filled with coal and after a fire is started in the bowl of the stoker the apparatus is started. This stoker or burner is constructed so that it can be controlled first by hand for plants that have the constant attention of an engineer who regulated the rate of feed by means of a three-speed belted pulley; second by steam pressure control in which case an electric switch is thrown on or off and can be adjusted at will; third by thermostatic control whereby the switch is operated by a rise or fall of temperature beyond fixed positions. These positions are also changeable.

The following data were furnished by the manager of the American Smokeless Burner Company. In two houses in Seattle the fires have run for two winters without being relighted and in the case of the smaller of the two stokers it ran all of last winter and kept the house at a constant temperature of 75 degrees. All the owner did was to fill the hopper which holds 140 pounds of coal every day or two and remove the ashes every four or five days. The fuel used from October to the following June cost $20.00, the price per ton being $3.15. The building is a two story wooden building of eight rooms. At another plant before the stoker was installed the coal used cost $4.50 per ton, and it was impossible to keep the house warm. Since the stoker has been installed coal costing $2.75 per ton has been used and the apartments have been thoroughly heated. It takes only one hour of a man's time per day to fill the hopper and remove the ashes, hence one fireman could take care of several apartment houses equipped with this form of stoker.

Comparing powdered coal with fuel oil Mr. Evans pointed to the analyses of some western coals. These show that they average ten thousand B. T. U. per pound, that is, figuring conservatively, 20,000,000 B. T. U. per ton. If California fuel oil averages 18,500 B. T. U. per pound and 7.8 pounds to the gallon, 42 gallons to the barrel, we would have 6,000,000 and 60,600 B. T. U. to the barrel. It takes, therefore, approximately 3 and 1/3 barrels of oil to the ton of coal. The oil would have to be sold at 80c per barrel to be on a parity with coal at $3.00 per ton. With fuel oil at $2.00 per barrel you could afford to pay $6.66 per ton for the coal except the cost of handling the ash which is not great. There is no smoke given out by the stacks of these smokers when they are operated properly.

Mr. Evans added that a smaller stoker has been invented, but has not yet been placed on the market. Some of its features resemble the operation of the American Smokeless Stoker. It is designed to burn as small an amount as one pound of coal per hour and to be used in residences and the smaller homes. This stoker can be controlled with a thermostate or an electric push button in any part of the house.

Concluding the speaker said, "By definite team work on the part of the coal producers, the coal salesmen, the fuel engineers and the public a large percentage of the small coal now being wasted can be saved to the coal company and the State or Province. Such team work will be a factor in successfully overcoming the inroads made into fuel markets of the Northwest by California fuel oil and cause this same oil to be utilized along lines where it will do the greatest amount of good. The oil supply of the world is very limited and should be conserved. The supply of coal in the Province of British Columbia and [illegible] State of Washington not to consider the coals of Oregon and California are sufficient to last the needs of the Pacific Coast States for hundreds of years and why not utilize these caols to the best advantage? By practicing true conservation we will make the supply last longer and the consumer will be able to buy a better grade of coal at a cheaper price.

Mr. Francis Glover, of the Princton Coal and Land Company, of Princeton, B.C., in dealing with the better Utilization of British Columbia Coal, suggested that the Government should introduce legislation preventing the coal lands falling into the hands of speculators whose one idea was to hold them in order to sell at a profit. Engineers, he said, should be appointed by the Government to see that coal was not extracted by wasteful methods. As to operators, he declared that they should realize that all conditions relative to the human element should be of the best. By this he meant safety condition, living condition and working condition. They ought to have the most up-to-date machinery and tackle and should be ready at all times to work in harmony with labor, referring disputes to the Government Board of Control and abiding by the decisions. On their part, the laborer should realize that production is imperative to the success of the coal industry, and it was his duty to handle idlers and malingerers. He spoke of the necessity of the railways providing the best transportation facilities possible and expressed the opinion that in the past one of the great drawbacks to the profitable mining of coal in British Columbia has been the intermittent tonnage. By this he meant periods of slackness and periods of great activity. This lead, during the slack period, to the deterioration of workings and roadways, and had the effect also during the periods of great activity of tempting operators to attain a ficticiously high output by following the line of least resistance and neglecting development work. In speaking of the present methods of burning coal he termed them a disgrace, and thought that there should be some effort at an educational campaign that would result in the practice of economy by the general public. Mr. Glover also dealt in a general way with the problem of utilization of the many valuable by-products of coal.

The Prospector.

Mr. John McConnell spoke on the "Prospector; What He should Be and How to Encourage Him." He spoke

of the absolute necessity of prospectors and the prospector's work in a mining country, especially a mining country in the early stages of development. Because of the pioneer work which he did, it was his opinion that every encouragement and assistance should be accorded these men. He said that the prospector's problem was his grub stake, and the speaker recommended citizens of Vancouver might give more attention to prospectors looking for such backing. It was a gamble, of course, but a gamble of the most fascinating nature. The odds were against the return, but if reward was obtained, it was likely that it would be of a very generous nature in proportion to the investment. Mr. McConnell thought that the prospectors might be given more aid in the work of developing their prospect to the end that they might become operators. He recommended too, that because of the complex nature of British Columbia ores such representation should be made as would bring about the establishment in the Province of ore testing mills in different mining centres. Plants of this nature, he said, would be a very great help to those engaged in mining in a small way. He thought that plants might well be established, one as an adjunct to the Scientific Department of the University of British Columbia, another in Nelson to supply the needs of the interior mining districts of British Columbia and a third at a point in the northern interior. These plants he recommended should be under the direction of skilled metallurgists who would in turn be under the jurisdiction of the Provincial minerologist.

In the judgment of Mr. McConnell, the Government also should construct at least two concentrating plants, one at Hazelton or some suitable point in the Northern silver lead district and one in Kootenay preferably at Nelson to take care of the southern galena belt. Referring again directly to the prospector and his welfare, Mr. McConnell recommended that a course in mining should be given at the University of British Columbia for his benefit and also that the Government might consider in dealing with the returned soldier problem the possibility of grub-staking those returned men who would prefer to prospect unexplored areas of the Province for mineral. This support, he suggested, might be limited to one or two years but he thought that such a measure would be largely taken advantage of and very much appreciated besides materially assisting development of the mining industry of the Province.

Taxation of Mines.

"Taxation of Mines" was the subject of an address by Mr. Valentine Quinn of the Granby Consolidated Mining and Smelting Company, Vancouver, B. C., and he was followed by Mr. T. W. Bingay of the Consolidated Mining and Smelting Company and Mr. Niclo Thomson, Chairman of the Mining Committee, Board of Trade, on the same subject. Mr. Quinn's address dealt with the principals which should be followed in his opinion in the taxing of mining properties. He said there were three cardinal features governing the employment of capital namely, its ultimate return to the proprietors, its safety during use, the interest or rent to be paid by the borrower. He observed that if capital is to be obtained its return to the proprietor when no longer employed must be assured and said that income might briefly be epitomized as the difference between the amount of money you take in less the amount of money you have to pay out incident to the operation. After some further amplification he laid down these principles:

(1) Capital must be assured protection during employment and ultimate return when its loan term is ended.

(2) Capital must receive a reasonable percentage of the earnings derived from its use.

(3) Income is only truly defined as the difference between earnings and the cost of their production and included in such cost must be the necessary provision for the first two items enumerated.

Further explanation of his position was given with the result that the conclusion was reached that interest on capital employed is a fair and equitable charge on the income its employment produces and therefore it should not be taxed.

He spoke of the possibility of considerable difficulty arising in the obtaining of outside money or capital for an investment in British Columbia mining enterprises if the course were pursued of making no allowance for interest on bonds in connection with taxation. He referred also to other proper exemptions, and concluded by saying that if a refinement of the Income Tax Act could be secured eliminating the indeterminate basis "on which it is presently proposed to assess the mining industry and taking into account the necessity of not only inducing new capital to come into the province, but permitting the repayment of capital already invested to be periodically provided for as well as to receive a reasonable return on its use, say 7 per cent, before determining the taxable income it would go far to wards developing the financial end of British Columbia's mining industry.

Addressing himself to the same question, Mr. Bingay arrived at practically the same conclusion. He thought that the Government should in its taxation policy exempt interest on borrowed capital in its estimation of what was termed taxable income. His opinion was that it would be more just and equitable to follow the lines laid down by the Dominion Income Tax Act, which applied equally to all individuals and to all corporations, regardless of the size of the income. "If an individual derives income from investments in a company, the normal tax is collected at its source, and he does not have to pay the normal tax again on the same income." Mr. Bingey said that this was not the case in the province, but that the individual paid income-tax first on earnings of the company in which he was interested, then again on the same money which came to him as income from the company. He also criticized the two per cent mineral tax as being inequitable, and felt that a deduction should be made for salaries of non-resident directors and managers. In regard to the allowance for mine depreciations, he did not agree with the limit of 15 per cent set by the Government, thinking it illogical for the Government to take the stand that in no case could a greater depreciation be suffered.

Mr. Nicol Thomson followed along the lines of the previous speaker endorsing in unqualified terms their arguments and their conclusions. He thought that any taxation should be based on the net income and not on the gross income, and that proper allowances for exemptions should be made for depreciation, development charges and so forth. This, he thought, was only right, inasmuch as the mining industry was one of very great importance to British Columbia, that it was at a point necessitating the acquirement of considerable sums of outside capital and that any undue burden in the shape of taxation could not but have the effect of discouraging investment.

The resolutions to which reference already has been made then were dealt with, as indicated, after which the Convention adjourned.

In the evening, the delegates assembled around the banquet table in the magnificent ballroom of the Vancouver Hotel. After the offerings of an excellent . . . . . which was duly appreciated, Mr. Fred T. Congton, K.C., former representative of the Yukon Territory in the Dominion House of Commons was called on for a short address. He congratulated the British Columbia Chamber of Mines on the splendid convention held under its auspices, expressed the opinion that it could not but be of very great benefit to the mining industry of the province and was of the opinion that such assembly should be repeated annually. In touching upon the Yukon, he said that it was a fallacy to suppose the Yukon Territory or Alaska had been in any way depleted in their mineral possibilities. Both these vast territories offered splendid opportunity to the prospector and explorer. He spoke of the fine type of men which the Yukon had turned out, referring to the whole country as a university which taught the traits of true manhood and developed in its people courage, enterprise and intellect. The climate, too, was greviously misunderstood. To talk to people in Eastern Canada and even in the West one would imagine, he said, that Alaska and Yukon were horrible places to live, the climatic hardships almost unendurable. This was absolutely untrue. It was true that there were occasional cold snaps. It was true also that if the people of Vancouver had to endure a temperature of 30 deg. below zero living in houses such as theirs were they would probably wake up in the morning to find themselves frozen stiff . (Laughter.) But in Dawson these trifling cold snaps were scarcely felt, in fact, they were considered desirable, as providing the necessary pep and stimulation for work. Seriously though, he wanted to put himself on record as stating that the climate of Dawson all the year round could not be beaten, and that for six months in the year it was much finer than anything that could be found in so-called sunny California.

The mineral and industrial possibilities of Prince Rupert and adjacent districts were the subject of a short address by Mr. A. C. Garde, the delegate from the City of Prince Rupert. Mr. Garde was very enthusiastic; pointed to the resources of the section from which he comes, and declared with unreserved enthusiasm that Prince Rupert was destined to become one of the most important communities or centres of the Pacific Northwest.

The importance of developing the iron ore deposits of British Columbia was the theme of an address by Mr. M. J. Carrigan, of Seattle. The substance of his remarks already has been dealt with. Briefly he declared with all the emphasis at his command that this province has the iron ore in sufficient quantity and of the required quality to make the establishment of a modest-sized smelting plant absolutely practicable. He commended the Minister of Mines for so stating in a public manner and with equal emphasis urged the people of the North-West to be up and doing in this matter in order that the shipbuilding industry may be maintained.

On Wednesday, the Convention was brought to a close with a trip to the mine and plant of the Britannia Mining Company, which is situated within a day's return journey from the City of Vancouver. A special invitation was given the visiting delegates and every opportunity afforded them to become acquainted, at least to some extent, with one of the largest and best managed mining enterprises of America.

General View, Consolidated M. & S. Co. Smelter, Trail, B.C.

British Columbia's Mineral Production in 1918

The value of the mineral production of British Columbia for 1918 is estimated at $41,083,093. This is an increase of about 11 per cent. over that of the previous year.

Mineral Production For Two Years, 1917-18.

	—Production, 1917—		——— Estimated Production, 1918 ———			
	Quantity.	Value.	Quantity.	Value.	Increase.	Dec'se.

Total production ..	.....	$37,010,392	.....	$41,083,093	$4,072,701	.....

It will be noted that the coal and gold companies are responsible for the satisfactory increase, there being a decrease in value of zinc, copper and building materials.

In the case of coal there was an increase in selling price as well as output. The increase in value of gold is, of course, an exact indication of increased production.

The increase in value of silver output is directly attributable to the higher selling price, there being actually a small decrease in output.

The increase in gold production is to be credited chiefly to a new mine, the Surf Inlet property of Canadian Belmont Mines, which made an output of about 43,000 oz. The Rossland mines have usually contributed about one-half of the province's gold, but during the past two years only about one-quarter the normal output has been made. Only very small shipments were made during the latter part of 1918. With the improved conditions for gold mining, it may be expected that production in 1919 will be much larger.

Most of British Columbia's silver comes from the Slocan district. In 1918 47 per cent. was credited to the Slocan. The Surprise, Queen Bess and Standard mines are large producers.

British Columbia is Canada's chief producer of lead. The total amount of lead produced in 1918 is estimated to have been 43,949,661 lbs., valued at $2,944,627. This represents, as compared with the previous year, an increase in quantity of 6,642,196 lbs., but owing to the lower market price of lead a decrease in value of $6,393.

The Sullivan mine, in the Fort Steele division is responsible for much of the lead output. The North Star, Queen Bess, Surprise, Standard, Blue Bell, Florence, Hyland and Cork-Provinces mines were among the large shippers in 1918.

The decrease in coper was in value, not in quantity. The production is estimated at 63,387,010 lb. for the year, an increase of about 7.4 per cent. over the previous year.

The Hidden Creek mines and the smelter at Anyox of the Granby Consolidated Mining and Smelting Company were operated practically continuously throughout the year, although closed for a short time by a strike, which was soon settled. A larger tonnage was treated than in 1917, amounting to approximately 828,000 tons, together with quartz and limestone flux to the extent of some 80,000 tons. With the increased tonnage handled there was a corresponding increase in the output of copper, approximately 30,400,000 lb. being produced, as compared with 27,661,301 lb. in 1917.

In the Boundary District the Granby Company's mines at Phoenix were unable to supply the smelter at Grank Forks with sufficient ore to run the smelter at capacity. The ores reserves of these mines are approaching exhaustion, so that the large-scale production of former years cannot be maintained. Also the high operating costs during 1918 left but little margin of profit in working the low-grade ores at Phoenix.

The Canada Copper Corporation, operating the Mother Lode mine and smelter at Greenwood, treated a slightly smaller tonnage than in 1917. About 165,000 tons were handled, from which approximately 2,200,000 lb. of copper was recovered, together with low gold and silver contents. Towards the end of the year the smelter was closed, the ore-reserves at the Mother Lode mine being exhausted.

The Britannia mine had a very successful year, approximately 750,000 tons of ore being milled, the production of copper from which is estimated at 18,250,000 lb. This is nearly 2,500,000 lb. greater than the 1917 production.

The Marble Bay mine, on Texada island, made about the same production as in 1917; the output is estimated at 740,000 lb.

Copper mining is now firmly established as the most important form of mining in the Province, and from all indications it should maintain this place for years to come. In 1918 the value of the copper mined

exceeded by over $4,000,000 the combined values of all other metals mined, and it formed 38 per cent. of the total value of the mineral production for the year.

It is also to be noted that 80 per cent. of the copper output is produced on the Coast, which has become the centre of the copper-mining industry, thus replacing the Boundary District, the old centre.

The quantity of zinc estimated to have been produced in 1918 amounted to 36,149,894 lb., which, compared with 41,848,513 lb. produced in 1917, shows a decrease of 5,698,619 lb. The estimate on zinc-output, however, may be low, as it has been difficult to get information regarding shipments to the United States. This production is valued at $2,501,573, which shows a still further proportionate decrease, as compared with the 1917 value of $3,166,259, due to the decreased market price of the metal.

It is estimated that the gross production of coal was 2,572,811 long tons, of which 280,743 tons was made into coke, leaving the net production at 2,292,068 tons. These figures show an increase, as compared with 1917, of 174,096 tons gross and an increase of 142,093 tons net. The quantity of coke made was about 190,656 tons, which is an increase of about 30,751 tons as compared with 1917.

New Marcus Tipple at Granby Co.'s Coal Mine

There has been published from time to time in these columns information concerning the new mining plant of the Granby Consolidated Mining, Smelting and Power Company, Ltd., at Cassidy Siding, near Nanaimo, on Vancouver Island. It is not our purpose here to go into the detail of mine development or the surface plant, as a comprehensive article will later be published by the engineers for the company, the Taylor Engineering Co., Ltd., of Vancouver, B.C. It is sufficient to state at this time that the arrangement of camp, housing facilities for the comfort of the employees, shops, bath house and boiler equipment is second to none in the West, the entire arrangement lending itself readily to the ultimate development of this property.

The engineers entrusted to Roberts and Schaefer company of Chicago the development of the tipple, and in view of the agitation against anything other than a solid body car, and consequently the use of rotary dumps, and also the careful consideration that must be given now that the war is over, to the better preparation of coal by picking or washing, it is opportune that the readers of this journal should have called to their attention the general arrangement of this plant.

The Tipple at Granbys New Coal Mine, Cassidy, Vancouver Island.

In locating mine car tracks, tipple and proposed washery, sufficient room has been provided for the storage of loaded cars pulled out of the slope, the loads being permitted, after passing over the knuckle to drift on and down grade at ground level to the loaded trip feeders, which feed the cars, one at a time on to the loaded car-haul.

After the cars have reached the top of the loaded car-haul, they drift over a platform scale and then on towards the rotary dump. This rotary dump is of the Head-Wrightson type, the Canadian rights of which, together with the Canadian rights of the Marcus patent picking table screen, have been entrusted to the care of Roberts and Schaefer company since the outbreak of the war. This type of rotary dump is not new to coal operators of Western Canada as it has been in successful use at a number of mines, but probably no where has it operated using a car of such large capacity as at Cassidy Siding.

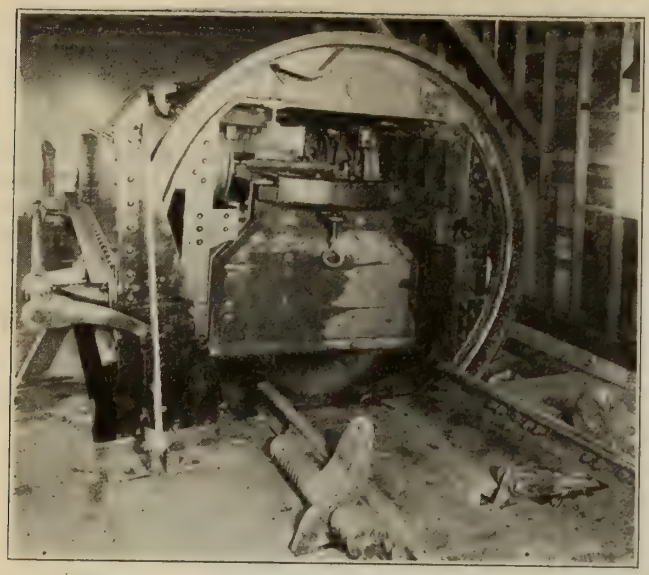
Another feature of interest in connection with this dump is that it is provided with Mining Safety Device Company's feeders, so that the feed of cars to the dump is automatically controlled, thereby avoiding delay and liability of wrecks which might happen if the cars were not regulated into the dump. All parts of the car feeders and revolving dump are of very substantial construction and are easily accessible in case repairs are necessary.

The empty cars standing in the revolving dump are started forward by the load entering, the arrangement of tipple tracks being such that empty cars run by gravity from the rotary dump to the kick-back and thence to the empty track, from which they are lowered by means of a car-haul to the ground level; whence they can drift on to either of the empty storage tracks for making up trips preparatory to lowering into slope.

Provision has been made for handling mine cars loaded with rock by taking off the rock cars at the head of the loaded car-haul, passing them over a rock track, which leads to a rock bin—this, however, for future requirements, at which time a duplicate revolving dump will be placed over the rock bin. The empty rock cars will drift by gravity back to the empty mine car track of tipple and thence on over the down haul to the empty yard.

For the early development of the mine the rock will be handled over the rotary coal dump, a by-pass being provided in the chutes leading from the dump so that the rock can be diverted into a temporary rock bin from which it is disposed of by means of wagons. Provision is also made in connection with the rotary dump and chutes leading therefrom to handle local trade or house coal.

The coal from the rotary dump is delivered into a receiving hopper from which it is mechanically fed on to a 5′ wide Marcus horizontal screen, the upper deck of which is provided with perforated plate for producing lump, nut and slack coals on three tracks as shown, or combinations of these sizes as might be desired.



The Rotary Dump, Granby Coal Mine.

Provision is also made in connection with the Marcus Screen for diverting the nut and slack coals to a conveyor which delivers this nut and slack mixed to the elevator of a washery which is now being installed by the Roberts and Schaefer Company, or the slack from tipple can be diverted to the conveyor leading to boiler-house.

Ample facilities are provided in connection with the Marcus screen for thoroughly picking the lump coal, and after passing over the lump perforations it is delivered without breakage on to an apron conveyor type of loading boom which lowers it into railroad cars.

Pickings from the Marcus table are carried forward in a pickings trough which shakes with and is part of the Marcus screen proper, these pickings being delivered to a refuse bin built in conjunction with the rock bin. Provision is also made in the tipple for delivering bone coal (with some good coal attached), to a crusher from which it is conveyed into the boiler house.

With the arrangements provided for handling mine cars and the facilities provided for preparing and handling the finished coal products, this preparation should prove one that will permit of low cost production, and when the washery is built, will load a product on railroad cars that will be among the best of the Island coals.

Britannia Mine

As you leave the boat at Britannia Beach you notice the powerful little electric locomotive hauling some heavy machinery direct from the boat, and upon enquiry, you will find that this machinery will be delivered with the least possible handling direct to that part of the works for which it is destined. They even have a track to the basement of the store to deliver merchandise.

Going up from the boat, after landing at Britannia you come to a neat, trim office building, where you always find the latch-string out, and Mr. J. W. D. Moodie, Vice-President and General Manager, or Mr. E. J. Donahue, Secretary-Treasurer. The very businesslike and, at the same time, genial greeting with which they greet you, will impress you. It is the same all over Britannia, that genial courtesy is everywhere.

The hotel has a comfortable dining room and the very best of food. At the store employees may purchase the best of everything at city prices. Everything is of the best. The store is exceptionally large, light and airy. It is fitted with a freight elevator, refrigerator system and special storage, for all kinds of foods, barber shop and even a shoe repair shop. Nearby are the steam laundry, blacksmith and machine shop.

Looking to the right as you leave the wharf you will see the bunkers from which the ore is landed on the steamers to be taken to the smelter. At the top of the mill, which is the 4100 ft. level, one first sees the skips used on the incline, and which is operated by a gravity system. Here also you get the first near view of the aerial tram, as the buckets dump their 900 lb. each of ore into the ore dump. This dumping is automatic, then the buckets continue on and are righted automatically and return to the upper terminal, a distance of 13,000 feet at the 27 ft. level. This aerial tram can handle 1,000 tons of ore per day and works 24 hours.

The skips carry ore from the ore bins at the top of the incline to the dump at the mill. They are operated on the gravity system, the hauling being done by a 1⅜ inch cable over an 8 ft. drum. Safety devices and brakes are operated by compressed air, and electric motor. The entire operation being carried on by one operator in a tower at the head of the incline. Each skip has a capacity of 15 tons and weighs, itself, 13 tons. The top of the incline is at the 2,700 ft. level, and is 5,400 feet long on a grade of 30 per cent.

A part of Beach Townsite, showing electric tram-road winding around mountain.

Incline to Mill—Note 1⅜ inch wire cable used to haul skips. Incline is 1,500 ft. from top of mill and is 5,400 ft. long.

Britannia Mine Entertains Delegates

When the committee in charge of the proposed trip to some important mine came back with word that Mr. J. W. D. Moodie, Vice-President and General Manager of the Britannia Mining and Smelting Company, Limited, said he would be only too glad to welcome the delegates of the International Mining Convention at Britannia Beach, the opinion of the Executive Committee was that, if the weather was good, this would be a trip of inspection worth while.

When Wednesday morning, March 19, the day of the trip, arrived, the delegates surely had Mr. Weatherman with them. The day was ideally bright and sunny. Everyone arrived at the boat with a smile and the feeling of good-fellowship was everywhere. The fact that the Convention so far had been a decided success from every point of view was responsible for a great deal of this.

After boarding the S.S. Ballena, the delegates had a good two and a half hours to get-together and talk over old times or business. This was one of the best chances the delegates had for getting acquainted. The orchestra provided music, which did a great deal to enliven the trip.

On arrival of the steamer at Britannia Beach, Mr. Moody was on the dock to welcome the delegates. That arrangements had been made to handle the delegation was amply exemplified when the committee immediately began loading up the cars which were ready on the dock waiting for those who were going direct to the mine. These cars were arranged with seats and hauled by an electric locomotive up to the foot of the incline. Here the delegates boarded the ore skips which took them up the incline 1,500 feet higher up to where the electric railway too kthem up to the mine tunnel.

From the time the members of the delegation boarded the electric tram at the dock until they were back and on board the boat, the employees in every department of the works put themselves out to explain and describe the different departments and each tram load had on board some one of the men in charge to explain the different locations and answer the many questions fired at them by the delegates at the different points. This was especially noted by all of those who made a tour of the mill. Every phase of the workings in this up-to-date plant was explained—from heads to tails.

The majority of the delegates ate their dinner at the company hotel instead of on the boat and found that the meal service here was like everything else at the Britannia Mines—first class.

On the return trip the boat left Britannia Beach soon after 7 o'clock in the evening. After giving three cheers for Mr. Moody and the different men who had showed them such great courtesy on the trip, the start for the return to Vancouver was made.

Pass Resolution of Thanks.

Between songs a few moments were spent in passing resolutions of thanks and commendation by the visiting delegations. There were short speeches by some of the committee. This episode was started by Mr. Buck, correspondent of the "Chronicle" of Spokane, who called upon Mr. Sidney Norman of the Spokane delegation to say a few words. Mr. Norman, after commending the work done by the committee done in connection with the Convention proposed a resolution as from the City of Spokane that the delegates from south of the line extend their sincere thanks to the citizens of Vancouver and the members of the British Columbia Chamber of Mines for the entertainment and courtesy shown the visiting delegates. Mr. Norman stated that, during the past ten years he had attended Conventions all over the States and Canada, and that there never had been one so successfully managed and attaining so much commendation as the present Convention. Mr. Carrigan, who, by the way, has earned the soubriquette of "Pig-Iron" Carrigan, through his memorable address at the banquet, seconded the resolution as coming from the Seattle delegation. In his remarks, Mr. Carrigan said, "At the end not of one perfect day, but of three perfect days, the delegations will return homes after enjoying the hospitality of the British Columbia Chamber of Mines." They came to Vancouver strangers and were going home friends. In fact, he believed that he knew almost everyone present by their first names. Mr. Carrigan stated that he had attended conventions for the past twenty-five years, and that this was the most perfectly managed convention he had ever had the pleasure of attending. The generous sense of business as well as the entertainment had appealed to all. The members of the committee consisting of Mr. J. D. Kearns, Dr. Hodge, Mr. A. M. Whiteside and others were deserving of the greatest credit for their hard and continuous work in carrying through the first International Mining Convention without a hitch. As a virgin effort it was remarkable. The interest developed at the beginning had kept up to the finish. The universal courtesy extended had resulted in sending home the most satisfied delegation ever attending any convention. It gave him the greatest pleasure to second the resolution for the delegates from Seattle.

An Idea of the Late A. B. Clabon.

Mr. Kearns was called upon for a speech and insisted on not being given so much credit for the success of the Convention, stating that everyone of the committee deserved equal commendation as they had all given up a great deal of their time to help make this Convention a success. Mr. Kearns stated that the late Mr. A. B. Clabon, who was formerly President of the Chamber of Mines, originally conceived the idea of the International Convention and Mr. Kearns gave Mr. Clabon his promise two days before Mr. Clabon's death that he would see that this Convention was carried on. He believed in making these remarks that he was doing credit to the memory of a man who had done much for the mining industry of British Columbia.

Dr. Hodge was next called upon and made a few remarks suitable to the occasion.

Acting Mayor Woodside expressed his satisfaction at the success of the Convention and extended the thanks of the City Council and City to the members of the Chamber of Mines for making the Convention such a success.

Mr. Norman made a few remarks, speaking of the losses experienced on both sides of the line in the death of many brave boys during the great conflict. He spoke very strongly along the line of these losses, bringing both countries much closer together with the lessons that can be learned from these losses.

Mr. Kearns moved that the thanks of the entire delegation be conveyed to the management of the Britannia Mining and Smelting Company for their hospitality during the trip and that a letter be sent to that effect. This was seconded by Acting Mayor Woodside and carried by unanimous vote.

The Mill.—Produces about 1,500,000 lbs. of copper per month. Runs 24 hours daily.

Ore Bunker Company steamer "Quadra" loading.

Gold

Address by Nt. H. N. Lawrie, Chairman of the Bureau of Mines, Oregon.

He said:—

We all know that the economic situation has been changed very rapidly from time to time and it is very hard to keep track of these changes which are very momentous and very serious bearing upon our present and immediate future. To start with I have prepared some charts and data. The year 1915 is the high point in the production of the world's gold which was 469 millions. The decline has been very rapid since. I propose to give you the percentages of decline in the past three years with respect to the production of 1915.

The total decline for the world's production represents 20 per cent. The decline for South Africa was only six and four-tenths per cent. The fact that the decline was no much less than the decline of the world is evidence of the fact that South Africa happened to be more remote from the centre of economic pressure. They had probably laid in their supplies in advance. Another factor is the improvement in the recovery of returns in the South African ores and that has tended to compensate for the economic conditions that have been so universal in the gold mining industry.

In Australia a country which was no less remote but on account of the fact that probably the resources of the Australian gold mines were diminishing we have a continuous decline from 1912, but the decline from 1915 represents 45 and a half per cent. The decline in Canada is 6 per cent. covering a period of three years. British India, the decline is 13 per cent., Rhodesia is 15 and eight-tenths per cent. and other colonies the total decline amounted to 46 millions and represents 15 and four-tenths per cent.

In the U. S. we find the decline to be 32 and two-tenths per cent. Of the total decline of 92 millions of the world's gold production, the production of the U. S. may be accounted a decline of a little better than one-third or approximately 35 per cent. while the U. S. gold mines produce one-fifth of the gold output. That denotes the extreme economic pressure and reflects the volume of the financial responsibility of the development of the natural resources and the responsibility of the U. S. when it entered the war. It was much more acute than it was in some other countries that had felt the pressure before that time.

In Russia we naturally expect that country would show the effect of disorganised government and so it does. The Russian decline is 62 per cent. for the three years and I suppose that spells more eloquently than anything else the effects of Bolshevism. The south and central American states showed an increase of five and three-tenths per cent. and I assume some of that increase has been made up from the by-products of gold. The Mexican crisis in gold production took place in 1915. It happened to coincide with the year in which the high point took place and speaks for the chaos in which the Mexican governement found itself at the initiation of their difficiulties. The production was a little over six millions and in three years it has increased to ten millions so that we have an increase in Mexico of 52 per cent.

All the other countries combined indicate a decline of 4 and two-tenths per cent. To analyse the situation in the U. S. a little more carefully, I have prepared a chart on exactly the same principle and covering the same years from 1912 to 1918. We find that California has just about maintained its production in a somewhat similar manner that South Africa maintained its production with respect to the world notwithstanding the fact that the economic pressure was so severe and showed such a decline in the other states. It is probably for the reason that a considerable part of the output in California is placer mining where labor is not so much a point in the cost of production. Then the interior states had difficulty in holding the seaboard. The decline in California is 23.7 per cent.

In Colorado we find a decline of 45 per cent. This is due to the labor situation and the complexity of the treatment of ores where the chemicals advanced so rapidly. In Alaska we have a decline of 45 and a half per cent. which corresponds exactly with the decline of Australia and it can be accounted for, not altogether by the economic pressure because you will recall the closing down of the Treadwell which was an important factor in the contributing to the Alaska production. Nevertheless the decline since 1917 shows the tremendous effect the war had on the Alaska production.

In Nevada we have a decline of 44 per cent. due largely to the treatment of their complex ores and the fact that they are located away from the coast. In South Dakota we have the Homestake mine which is so well developed and is such a homogeneous ore that they were able without difficulty to maintain their output in fairly good shape. Their decline is only eight and three-tenths per cent. In Arizona the copper production extended very rapidly in the last three years and that expansion gave an expansion in their gold output of 26 and four-tenths per cent. In Montana we have a decline of 36 per cent. and in all the south states and dependencies combined of the U. S. we have a loss of 33.4 per cent. That corresponds with the general loss for the entire U. S.

This third chart is an attempt to show a combination of factors which enters into the stress of the decline in the gold production throughout the world. In 1912 the Hypothetical gold mine yielded $12 per ton and the total cost of production was $7. You get the cost per ounce of production of $11.70 with a profit of $8.30 per ounce. I have assumed the price of gold at £20. Here is a condition and that is the depreciating value of the ore at depth and the increased cost of production and these two factors would give, regardless of any economic pressure that would be brought to bear. So that in this year of 1913 we have a recovery of $11 per ton at a cost of $7.50 per ton. In this case we had a production cost of per ounce of $13.60 while the net saving was $6.40 per ounce. These two factors combined gave a return of $10 per ton and a cost of recovery of 8 and a half dollars combined to produice the cost at $16 per ounce with a profit of $4 per ounce.

It was apparent at this time the management prior to 1915 decided that they were creating very rapidly an economic limit and while they had been operating on a 3,000 ton basis per month they estimated that they should be able to reduce their cost by multiplying their output. They did that and we have a decline which shows a result from that policy. 1915 with a double output we have a recovery of $9 per ton at a cost of $7 per ton for the total cost of recovery which make the cost per ounce $15.60 with a profit of $4.40.

From that time we have this other component to deal with this economic pressure this decline in the purchasing power of the dollar which was due to the fact that we were pressed to obtain war materials at a very rapid rate and the consequent currency inflation in the open market and the credit expansion that was bound to take place which it did and, according to the best economic theory when they increased the currency and expanded the credit we were bound to come to a reaction in the commodity prices. From here on the economic pressure is rapid and in 1916 we find the gold ounce was $17.60 with a profit of $2.40. In that year the recovery was eight and a half dollars and the cost increased fifty cents to $7 and a half dollars.

In 1917 we find a continuation of that. We recovered the same amount per ton and the total cost had risen fifty cents making it eight dollars per ton and the total cost per ounce was $18.80 with a profit of $1.20. In June 1918 the total cost of recovery was eight dollars per ton and the total cost of recovery was $10 provided the mine continued operations. Many properties did shut down which was wise business policy. Here we get a total cost of $25 per ounce which would have made a net loss of $5 per ounce and when in 1918 we have $30 per ounce cost of production which would have made a loss of $10.

This last chart shows the ebb and flow of the gold imports and exports from and to the U.S. from the fiscal years 1913-14. They always end on June 30. In 1914-15 we came out of the negative conditions, we were in in 1913-14 and 1914-15. This would have been considerably greater in favor of our balance of gold in favor of the U.S. had it not been for the fact that all our foreign securities were liquidated against the trade balance; that was in our favor at the time and this probably continued somewhere between 1915 and 1916 and after they were liquidated. Of course the gold rapidly flowed into the treasury and it may be said that much of this gold represented, belonged to neutrals who remained neutral during the entire period. Of coures this enabled the U.S. to enter on a financial offensive regardless whether the neutrals were willing or not.

In 1916-17 this gold import amounted to nearly one billion dollars. Of course our exports of gold in the same year brings the amount down considerably. I want to particularly point to the fact that from June 30, 1917, you will note the very rapid decline that took place in the movement of gold. In fact we developed a balance against us in actual gold of 66 millions in 1917-18 and since that time the gold movement has been practically negligible. It has been marking time.

It can be readily seen that the U.S. by liquidating its obligations in foreign countries by having thris gold reserve in custody, has become more or less a creditor of nation. And it is very important that the world be informed as to what attitude the U.S. may be expected to assume because of this tremendous responsibility that has been thrust upon her by the war. But before going into the matter of international trade and commerce I would like to call attention to a condition which now exists which is based altogether upon a league of nations as to what we may expect to have in the way of commodity prices in the next two years.

Some persons have it figured out that those prices are bound to drop, and they are waiting to see what the trend of those prices will be before they expand and go into production. The aggregate of this when translated into terms of production was that it has created a condition of stagnation which is just as artificial in its conception as the tremendous gains that has been made in commodity prices due their action of economic barriers. Had we at this moment concluded our period of readjustment and new construction, we might expect to be able to contract the currency but we have not yet reached that period and we have got to expand our currency in order to meet that exigency.

Temporally while we are marking time waiting for the peace treaty to be adopted the door of international commerce has been closed. Commodity prices in this country have dropped slightly but they are bound to increase because of the fact that we have to expand our currency and extend our credit and it is good policy that that extension should take place because we have very many vital problems to deal with in this period.

In response to those gentlemen who are waiting, in response to the municipalities which are waiting, in response to the provinces and states that are waiting, to them it seems conservative to wait, but let us see what will result from that watchful waiting policy.

With the signing of the peace treaty there will be a tremendous demand for the delivery of a great variety of commodities to the Europtan countries and those gentlement who have waited will find themselves in the same market with this great demand to obtain delivery of their equipment. Aside from the delay they will have passed through the period of two years in which we are going to have these high commodity prices which will enable them to recoup what little excess of prices now exists bya period of production for those two years and they will be in the market to obtain delivery of this material and I doubt very much whether the domestic demand will be delivered first. Why should it be. These countries are entering upon a period of reconstruction that is altogether vital to their existence and they should have the first command of this material and we should certainly be prepared to place our order during this period when the demand may be made.

This condition reminds me of the fact that generally speaking industrially we are marking time at a time when we should be going over the top. The boys in France were not called upon to mark time. They were called upon to go over the top and they are returning better citizens and more capable men to assume the responsibilities of our new constructive industrial life. They do not want to take part in this marking time at home. They are not looking for charity. They are not looking for anything but an opportunity to enter upon a most progressive programme and why not. They have seen too much of activity to settle down and and keep settling down.

Among the various developments that could be made, the mining industry is one of the best for these men to participate in. In times of peace the mining wage has always been the top notch wage. There is not a cleaner business and there is not a business in which they can change with more enjoyment because of its outdoor life in the mining industry, and I believe this convention is well timed and that it will have a most marked effect in accomplishing this result and to the people of B. C. is due the credit for having seen the necesity for allocating the mining industry in the general progressive development of our industrial programme.

Now I should be very frank in stating this, because I believe this is no time to withold the truth. This is no time to camouflage the situation. Our future depends largely on our conception of the truth and our actions in accordance with it. In the matter of international trade I have said the U. S. has become a creditor nation. The U. S. has always been a nation which has seemed full of self interest. I do not wish to convey the idea that there is anything philanthropic that the economists and financiers have in the U. S. concerning the future because that would be camouflage.

But I want to call your attention to the breadth of vision these gentlemen have. We have our goods bought and we are enabled to get them home and we have got to do certain things. We have to educate our people and you in Canada have to educate yours for the necessity of absorbing foreign investment in Canada and the U. S. Why. Because the foreign countries with whom we desire to trade have not the gold to deliver. They have not the goods to deliver because their industries are paralysed and the trade balance is against them.

To draw on their currency would cripple them internally. With what will they pay. They have nothing with which to pay until a broad policy has been developed to absorb the securities of these countries in order to offset that balance. The great variation in commodity prices in the U. S. has been largely due to the erection of economic barriers. Price taxation by government is always an artifice. It met the requirements of the war but it does not meet the requirements of peace. We have to eliminate those artificial barriers. Let the good old immutable law of supply and demand govern the situation. We have been a long time with it and it has never proven false.

During the period the barriers have been erected domestically and in a large measure these barriers have been erected internationally, what has been the result? The U. S. put an embargo on gold and they have been paying a premium of 7 per cent. to get a draft to Buenos Aires. Of course the Canadians know they have been paying 2 per cent. on account of the fact that they put an embargo on gold and it simply represents a physical difficulty in making an exchange. We have got to have more money for development and I am wondering whether it might not be prudent to consider whether the inflow of capital would not greatly offset the advantages of maintaining such an embargo. And this argument applies to every country and it is to the future course of trade. I hesitate to use the word freedom of trade because I might be misunderstood, but I mean that condition of trade which imposes a burden upon the free transportation of products between any two countries in the world.

It is alarming to consider what some of those exchange rate have been and are now. Roberts says it has been necessary to pay as high as 50 per cent in Spain and in Italy it has been necessary to pay a premium of 100 per cent. In Paris it goes to 5 per cent. to get a draft to New York and sometimes as high as 10 per cent. In London a New York draft costs 2 per cent. but it has taken steady lending by this country for the last three years to hold it down to that point. It is also due to the fact that there was 62 per cent of the world's gold output inside the British Empire.

The first condition that is going to assist the gold mining is this freedom of trade which is a most important thing, the resumption of a sound financial basis of trade with foreign countries. We know the demand is there. Those gentlemen who are holding copper at the present time even operating extensive margins in order to hold it but these supplies are necessary.

The effect of putting gold on the open market would be to give the old miner what he justly should have and I may remand you of the fact that while other metals have dropped gold has been keeping at the constant level. That is a very excellent omen. Some people have been so anticipatory of this condition as to say there will not be gold enough. We know that most of the nations are on that basis and the others will be forced to it. They will have to speak in the same language as we have and they will have to adopt the same vocabulary. The British pound sterling has won for Britain the commerce of the world in the past. It has spoken very eloquently of the sound finance that was back of it and the promise to pay is going to be supplanted by no substitute. Why should it be? It has taken us a century and seven years to win for that piece of paper its hundred per cent. value and is based on gold at a fixed price of 23.22 grains per dollar in terms of the currency of the U. S.

So that I find in analysing the various statements that have come from economists that those who believe that our debts are to be repudiated and our standard changed are very far from the fact. We have got to hold the ship to the shore. So far as I can see the extension of Bolshevism is one of the menaces we are confronted with and this marking time on new investments is not putting a backfire on Bolshevism. The best backfire to Bolshevism is to create a condition of employment that is universal, to create a margin of profit which represents a good living for labor and those fellows will have the wind taken out of their sales. They are operating on a draft that is being blown by their own bellows and it does not get anywhere. Even in their ranks the radical of today is the conservative of to-morrow. It is amusing to see the transition when one of them is elevated to be ruler over them. He immediateily develops that ultra-conservatism that we perchance would not dare to assume.

MANAGEMENT OF CONVENTION.

The British Columbia Chamber of Mines, through its Executive committee undertook and carried out all arrangements for the entire three day's program and to the executive and committees the entire unqualified success of the Convention is credited. Every man on the executives and committees and others who assisted carried on day and night during the entire three days. The executive committee consisted of the following:

Mr. A. M. Whiteside, Mr. J. M. Lay, Dr. E. D. Hodge, Mr. H. P. McCraney, Mr. Nicol Thompson, Alderman F. E. Woodside, Mr. J. D. Kearns.

Committees.

Manager of Convention, Mr. J. D. Kearns; Program, Dr. E. D. Hodge, Chairman; Machinery Exhibit, Mr. S. J. Crocker, Chairman; Mineral exhibit, Mr. Kenneth S. Robinson, Chairman; Trip, Mr. I. Thomas; Hotel, Mr. A. H. Wallbridge; Resolutions, J. E. Thompson, M. P. P.; Publicity Director, Mr. T. J. McIlveen.

It must not be forgotten that Mrs. A. M. Whiteside and Mr. J. M. Lay did a lot of hard work in entertaining the visiting ladies who were present, and the Chamber of Mines is indebted to these ladies and their assistants for taking care of this part of the programme.

Mineral Exhibit

International Mining Convention Held at Vancouver, March 17, 18, 19.

By EDWIN T. HODGE, M.A., Ph.D., Prof. of Geology and Minerology, University of British Columbia.

A feature which attracted a great deal of attention at the International Mining Convention was the exhibit of minerals. Visitors were deeply impressed with the siez of the exhibit, the great range of minerals displayed and the evidence it gave of the mineralization of the entire Province. Many complimentary remarks were made by visitors who agreed that it was the largest and finest display of minerals ever gotten up in Northwest and many went so far as to say that it compared with the exhibit at the San Francisco Fair.

There is much discussion now in the local papers and among business men to the effect that British Columbia should prepare exhibits of this character and send them to all parts of the world. Especially should one be placed in the British Columbia House in London, England, and in New York City. The B.C. Chamber of Mines is in daily receipt of letters from Japan, China and various points of the United States which request exhibits of our minerals for display in Chambers of Commerce and other places. It would seem from this that British Columbia can do much to attract investors by a proper display of her wares in centres of foreign capital.

The display of minerals brought out very forcibly several ideas. One of these is that British Columbia is above everything else, a mineral Province. No part of it is without mineralization of some sort. Prospects abound everywhere. In fact, I do not believe there is any part of the world which contains, for the area explored, so many prospects. Almost every part of the Province that has been examined has shown mineral developed in a greater or less degree. This is in striking contrast to many other mining areas where prospecting has to be continued for a long period of time before even an area of mineralization is found. This prodigality on the part of nature in giving to British Columbia so thorough a mineralization is perhaps the very reason why such prospects of mineral deposits as are found do not receive the intensive development that they receive in other parts of the world.

Most of the minerals displayed in the exhibit were from prospects, few of which have received any thorough developmental work. One cannot help but be reminded of the fact that almost all of the big mines existing in British Columbia at the present time were, at one time, prospects with no better showings than those whose ores were exhibited at the Convention. The only difference, as far as the writer can see, is that the prospects, which developed into big mines, received intensive, persistent and long continued exploration work, frequently in the face of discouraging results until finally results of a substantial character were produced. As stated above, in other parts of the world, where mineralization is not so universal, a prospect, when once found, is at once developed and this development work continues until the prospect is either proven only a prospect or developed into a mine. Here in British Columbia the prospector or the prospect owner rarely proceed to active development work. The percentage of prospects properly developed in a thorough manner, which have developed into mines, is large. Very few failures due to a real lack of ore are recorded. The difficulty has always been one of getting our prospects thoroughly examined rather than lack of ores of intensive mineralization. This fact should make one look with favor upon many of the mineral occurrences. This is especially true when one considers that the Province, as a mining community, is only a few years old and that of the $126,000,000 invested in mining enterprises over $64,000,000 at this early date has been returned.

To the geologist these facts are not at all surprising. In no part of North America are the geological features which favor mineralization so highly developed. British Columbia contains thick series of sedimentary rock which have been penetrated time and time again by large and small intrusive masses of mineral bearing igneous rock. A study of the geological map of North America will show that mining areas are definitely related to areas of sedimentary rock cut by igneous rock and this examination will further show that British Columbia contains this particular feature to a degree greatly surpassing that of any other portion of North America.

That British Columbia is an area of so extensive and intensive mineralization is not generally known. There seems to have been a conspiracy of silence regarding British Columbia's mineral possibilities. This conspiracy of silence has persisted even up until the last few years. Of the large mining companies in British Columbia, all of them, with one or two exceptions, can count their history in the Province for only a few years back. Another striking fact is the very limited number of investors in mining in British Columbia. As the area for prospecting is becoming smaller and smaller with the passing of time and mining investors are beginning to look to the farthest ends of the earth for mineral it is beginning to look to the farthest ends of the earth for is surprising that an area containing such attractive ores as were shown at the mineral exhibit should have lain unnoticed, undeveloped and unadvertised for so long a period of time. Now, however, the mineral wealth horded in the mountains of British Columbia is beginning to be recognized. Evidence is at hand that many of the large mining companies in the United States are looking to British Columbia with a great deal of interest, and we may confidently expect to see a real BOOM in mining development during the next ten years.

The ores represented in the exhibit came from areas more or less isolated and in great need of means of transportation. The present policy of the British Columbia Government to build trails, waggon and railroads is highly to be commended. The development of means of communication will perhaps do more to stimulate mining than any other one thing. Another fact brought out by the exhibit is that coal is British Columbia's most important mineral.

Canada contains one million two hundred thousand million tons of coal, or more coal than all the rest of the British Empire put together. Of this large amount of coal, British Columbia contains more than half and, furthermore, the coals of British Columbia are of much higher grade than those of the rest of Canada. The coals of British Columbia, as shown by the exhibit, range from lignites to anthracites. In fact British Columbia contains in the Ground Hog field the only anthracite known in Canada. Lignite coals are rare. Most of the coals in British Columbia are bituminous in character. In these days when coal is looked upon as something more than a fuel, when we are considering ways and means of utilizing all of the by-products of coal, we must look with great favor upon any coal which will

provide a high grade coke and a large percentage of by-products. British Columbia, apparently, judging from the exhibit is rich in such coals. At the present time only two coal-fields in British Columbia are used in the manufacture of coke, the Fernie coals and some of the Vancouver Island coals. This appears to be a very regrettable fact. There seems to be no good reason why many of the coals, if properly handled, could not be used to make a high grade of metallurgical coke. This is particularly true of the Vancouver Island coals. The law that iron ore always goes to coal still holds true. It is desirable, therefore, that the iron go by the shortest and cheapest route.

The Coast area of British Columbia contains abundant iron, and if a good metallurgical coke can be made from the Vancouver Island coals then the movement of these iron ores to the coals would be easily accomplished by water transportation. Coal may be looked upon as the greatest resource in British Columbia and the one upon which our great industrial future must surely depend.

However, British Columbia is not limited to one mineral, as was evidenced by the large display of copper minerals. British Columbia now possesses the three largest copper mines of the British Empire. One only has to go back a few years to the time that the copper output of British Columbia was almost negligible. The present large copper deposits then were only prospects and not extremely attractive ones either. There exists in British Columbia at the present time a great many prospects as attractive as were the prospects of Hidden Creek, Britannia and Copper Mountain a few years back. If capital could only be encouraged to explore some of these more attractive prospects, there is no doubt that many large mines would be developed. The ore exhibited illustrated the fact that chalcopyrite is the fundamental copper mineral of British Columbia. It seems to occur all over the Province. Very attractive specimens show that this mineral occur abundantly at such widely separated places as Princeton, Trout Lake, Hazelton, Kamloops, Lillooet, Queen Charlotte Island, the Skeena, Bear River and many other localities. Much of the chalcopyrite exhibited was associated with pyrrhotite as at Rossland, Kingston, Mammoth Valley and along the Coast and particularly upon Vancouver Island. Chalcopyrite associated with pyrite is a characteristic association at the two largest copper mines, Hidden Creek and Britannia. Much of the chalcopyrite is rich in gold as is illustrated by the specimens from Copper Mountain, Britannia; Voights Claim, Black River, Lillooet; Bear Creek, Tulameen and Calapo Group at Clayquot. Some of the chalcopyrite contains platinum as illustrated by the specimens from Grand Forks. Secondary copper minerals are generally considered to be lacking in this province. In fact a few years back our mining journals were filled with discussion attempting to prove that British Columbia could not be expected to contain copper ores derived by secondary enrichment. Even to-day learned engineers solemnly shake their heads when one mentions prespect of secondarily enriched minerals in British Columbia. The exhibit showed that the dry belt of British Columbia abounds in occurrences of secondary copper mineraliaztion. The dry belt has always been looked upon with disfavor by mining men, chiefly because of this type of mineralization. That all secondary occurances of copper mineral are not necessarily small and sporatic has been definitely proven by the exploration work carried on at Copper Mountain, Princeton. Why is it not reasonable to think that many other deposits of secondary copper mineralization may not prove to be as large as the one proven at Copper Mountain?

Many ores were on exhibit containing minerals of the bornite and chalcocite association. The following illustrations of this type of ore may be cited: Drum Lummon, The Grafter, Whitehorse; Emma, Discoverer, and Copper-Kid of the Skeena; Silver Kind and Hamilton Fraction in the Slocan; Nesbitt and Archie at Portland Canal; White Rock at Kamloops and other places. No doubt some of these are ores derived by secondary alteration of primary ores, but the writer thinks that a few of these are ores deposited directly from magmatic solutions, and for that reason offer an attractive inducement for exploration. Many ores of the chalcocite and bornite association are rich in silver as those of the Drum Lummon, the Seniorita at Trout Lake and several specimens from the Omineca Mining District. Native copper specimens were on exhibit from two prospects, the Aberdeen and Oregon Group, both of the dry belt.

The statement is commonly made that copper mining in British Columbia is a pursuit open only to very wealthy mining corporations. This is obviously not true. Transportation and smelter facilities permitting, many of these silver and copper rich ores could be mined in a small way and be made to pay.

The mineral exhibit perhaps proved that, of the metallic minerals, copper is going to be the most important one of the Province, but it can never greatly exceed the silver lead minerals in value. Excellent specimens of this type were displayed from the Slocan, Hazelton, Portland Canal, Alice Arm, all along the Grand Trunk Railway, and in the Omineca District. Even parts of British Columbia usually stated not to be highly mineralized sent in very fine specimens of argenliferous galena from the Ainsworth, Windermere, Couverapee, Lardau, Ymir and other places of the Rocky Mountain Terrane. Specimens from the Monarch Mine at Field reminded us that some of these deposits could be mined and yield handsome profits. Some of these silver bearing galena ores are associated with sphalerite which, at the present state of our metallurgical skill makes them unattractive. However, metallurgy and ore dressing has in the past made very rapid progress and ores which a few years ago were considered useless to-day command premium prices. Perhaps some of these zinc rich galena ores will not have to wait long before they occupy a similar position of favor. The ores from the Sullivan Mine at Ainsworth teaches what may be expected from some of these sphalerite prospects.

Next to coal, iron is the next mineral of fundamental importance. In fact, a geographical unit devoid of iron ores would be economically helpless if placed beyond the assistance of her iron rich neighbors, as by war, for instance. For this reason the development of the iron industry in any country should be looked upon as one worth a great deal of Governmental assistance. Iron ore deposits, like railroads, should not necessarily be developed with the expectation of dividends, but in order to make possible other industries whose profits will, to the Government, more than compensate the loss incurred through the development of the iron mine. British Columbia stands in a position to furnish to the Orient a large number of iron fabricated mechanical devices providing these devices are manufactured on the Pacific Coast. The manufacture of all of these is dependent

upon the supply of iron. Therefore it behooves our Government to make the most of its iron deposits. British Columbia has no good excuse for not developing a large iron and steel industry. Coal capable of making good coke abounds, and the mineral exhibit shows that iron ores occur in many places. Every few miles along the Coast a deposit of magnetite exists. These deposits are of a type which, under similar conditions in some other places, have been proven to contain large tonnages, and in several cases have been proven to contain many million tons of ore. In fact, there is enough of this magnetite ore in sight on the Coast of British Columbia to keep a blast furnace of several hundred tons capacity in continuous daily operation. Magnetite ores occur not only along the Coast, but specimens were on exhibit from the Arrow Lakes, and from the vicinity of Kamloops. Magnetite practically is the chief iron ore of British Columbia, but hematite ores also occur as at Tatla, Clinton, Bull River, Y.T.; Kitchener of the Chilcotin; the Bear River and Portland Canal. Limonite ores were exhibited from the Standard near Hazelton, from Mons at Alta Lake and the Portland Canal, from Chilliwack Lake and from the Rainbow Claims near Hope. Gossan limonite ores were exhibited from Sheep Creek, the Mother Lode and Bitter Creek near Stewart, B.C. Specular hematite ores from Princeton and Nicola were shown. Not only did the exhibit indicate that British Columbia possesses many iron ore occurrences, but it also proved that those minerals needed to make the important ferro alloys. We may confidently look forward to the time that the Province will be producing along with the iron and steel all of the ferro alloys needed in the steel industry. For example, Tungstein in the form of Wolframite from the deposits in the Atlin district, and Sheelite from the Van Winkle claims in the Cariboo was exhibited. Chromite ores occur in many parts of southern British Columbia, as at Cascade, Olivine Mountain and in the vicinity of Ashcroft. Excellent specimens of molybdenite were on exhibit from Alice Arm Corrundum Claims at Skeena; Lost Creek at Nelson; Timothy Mountain, Cariboo; Bald Mountain on the North Thompson and Texas Creek in the Lilloot. Rich manganese minerals were on exhibit from Kaslo and especially from Cowichan Lake, Vancouver Island. Specimens of high grade magnesite were on exhibit from the enormous deposits in the vicinity of Clinton.

Right now, while copper seems to be temporarily without a strong market, gold ores are receiving much attention, as evidenced by the large number in the exhibit. Like the iron ore prospect, the gold prospect deserves a great deal of encouragement, especially now, when our highly inflated credits must sooner or later be liquidated by real gold if we are to preserve the Dominion credit. One of the striking things brought up by the mineral exhibit was the low state to which gold placer mining had fallen in British Columbia. Only a few samples of gold sand and nuggets from the Cariboo were on display.

When one compares the geological similarities existing between the Cariboo and Australia or Tasmania, one cannot help thinking that these placer deposits will sooner or later lead to important lode deposits which will, when developed, far surpass the placer deposits in yield. In other parts of British Columbia lode gold ores are developed as at Surf Inlet, Engineer Mine and the deposits of Bridge River. One of the most interesting specimens of the exhibit was the specimen of the new ore recently developed at Rossland, which carries as much as $2,000 per ton. This ore seems to occur in large quantities, and the probabilities are that Rossland will soon again become a very active camp.

The above is a discussion of major minerals, but many of the so called minor minerals were on exhibit. Among these minor minerals may be mentioned some of the following: Arsenopyrite ores at Hedly, muscovite specimens from the Clearwater country and from Tete Jaune Cache; stibnite ore from the Alps Alturas of the Slocan, and rich silver bearing ores from the Mary Reynolds Mine, salt and sodium carbonate minerals from the Clinton district, diatomaceous earth from Atlin and from the vicinity of Nicola; beautiful specimens of fluorite from Grand Forks; specimens of strontianite from the Daffodil Claims in the Lardau, and from claims near Princeton; Gypsum from many parts of the Province; cinnabar from Field and Kamloops; platinum from the Cariboo and from Olevin Mountain. One should not leave this discussion without mentioning the exhibit of oils. Two sets of samples were displayed, one from the Southeast Kootenay and one of seepage oil obtained from the vicinity of Vancouver.

It will be seen from the above that the mineral exhibit of the International Mining Convention stamped British Columbia as a Province containing a large number of mineralized areas. It proved that the mineralization is not only, as is often stated, of low grade disseminated ores, but at places occur very rich concentrated ores, and it further proved that the mineral prospects of the Province are not confined to one or two types of minerals, but contain almost the entire gamut of mineralization.

SLEEPING QUARTERS.

The Alaska B. C. Bedding Co., Ltd., manufacture a most sanitary line of camp springs, camp beds, and camp mattresses. As these are manufactured in the same factory as the celebrated Ostermoor mattress, you may be sure that for strength and durability they are not to be surpassed.

THE B. C. CHAMBER OF MINES.

Every man in any way connected with the mining industry in the Province of British Columbia, whether he is a resident of the Province or not, should become a member of this organization. The executive of this organization planned and carried out the most successful mining convention ever held on the American Continent, and as this was of an International nature, this success is more to the credit of this live organization than if it had not been of the nature of an International gathering of men most prominent in the mining industry.

To make their work more lasting, and to further the interests of the mining industry of British Columbia, the B. C. Chamber of Mines ask all who are interested in advancing the interests of the Province to become a member of this organization. The annual membership fee is $5.00.

Information and answers to all queries will be gladly furnished, by the Secretary. Address all communications to the B. C. Chamber of Mines, Dominion Bldg., Vancouver, B.C., Canada.

by the various States. This arrangement may seem idealistic and impractical, and it is offered here largely for the purpose of causing reflection and argument, but at the same time, unless the mining industry can put into effect a system that will be fair both to employer and employee, and that will prevent obviously unfit men from working underground, it will be almost useless to make any other effort toward prevention of illness among employees. I believe that the time has come for the American Institute of Mining Engineers to consider seriously the necessity and the means of carrying out physical examinations and to take a definite stand.

The second requisite for the prevention of illness among employees is the maintenance of working conditions underground on a high plane of sanitation and efficiency so that illness arising from working conditions may be held to a decent minimum. The greatest need in the improvement of underground conditions is the elimination of dry drilling in hard-rock mines. The relationship between hard-rock dust and miners' consumption has been so clearly demonstrated that it is not subject to argument; suffice it to say that the efforts made in England and in British colonial possessions to deal with this evil have shown the possibilities of abating it, while in this country little has been attempted. As long as dry drilling is permitted in hard-rock mines, just so long will we have an inordinate amount of pulmonary disease among the miners. That this has worked an economic hardship on the industry, aside from its humanitarian features, and that it has been one of the causes of the better grades of mine labor leaving the industry, is apparent to any one familiar with the conditions, and it is hard to understand why the subject of dry drilling has received so little attention in this country. Dry-drilling apparatus may be as deadly as a machine gun, if somewhat slower, and its continued use in the mining industry is a matter of reproach. While it may be true that the water varieties are not as satisfactory as they might be, at least their improvement should receive serious consideration. It is incredible that American ingenuity, which has produced the telephone, the telegraph, and the flying machine, should be unable to cope with the production of a water drill that would largely make impossible miners' consumption.

Conditions of ventilation and temperature underground are not what they should be, and have never received the attention in metal mines that they have in coal mines. This is also a matter of prime economic importance because a greater amount of work can be done under conditions of proper ventilation and temperature than when there is poor ventilation and high temperature. While the latter may not cause specific illness, certainly they lower the vitality, lessen working ability, and predispose to many illnesses; if we are to have healthy miners we must so arrange it that they can work in places properly ventilated and not excessively hot. Mine ventilation is too complex a subject to be considered here, but the use of small fans with canvas tubing seems to offer a satisfactory and economical means of improving ventilation.

Proper toilet facilities underground are important as a health measure, but vary so much according to the size and locality of the mine that they need not be gone into in detail here; besides, their principles are well understood.

PREVENTION OF ILLNESS AMONG EMPLOYEES IN MINES.

By A. J. LANZA.*

(A paper presented at New York Meeting American Institute of Mining Engineers, February, 1919.)

The prevention of illness among the employees of the mining industry is especially important in view of the importance of the industry, the unsettled conditions of labor, which emphasize the economic necessity for conservation of labor, and for humanitarian reasons. The burden of chronic illness is altogether unwarranted and unnecessary. If the industry is to maintain its labor supply in an efficient manner and keep the standard high, it is essential that it make every effort to keep its labor in good physical condition.

The basis principles underlying health conservation are the same for any industry, but they are here applied, especially to the mining industry, and more particularly, perhaps, to metal mining, as it is with this phase of the industry that the writer is most familiar, and as it is conceded that metal mining presents more health hazards than coal mining.

The first step in the prevention of illness lies in securing employees who are in sound health and free from organic disease. I do not mean that all men who go underground should be physically perfect, but they should be free from organic defects of the heart, lungs, and other organs, or from anatomical defects that would markedly increase their liability to accident. The number of men working underground in mines in this country whose physical condition totally unfits them for such work presents a situation that should not be allowed to continue, and which I believe is not equalled in any other industry in the country. There is but one way to secure men who come up to the required standard, and that is by a thorough physical examination before employment. I am fully aware of the objections felt toward such a procedure by many employers and employees. There is much to be said on both sides, but to any one who is at all familiar with the mining industry as it is today in this country, and who approaches the matter with an unbiased mind, there can be absolutely no doubt as to the necessity for physical examination. As a purely logical proposition this is self-evident, but there remains the further necessity of placing physical examinations on such a basis that they can be administered in a just and equitable manner free from the abuses and suspicions to which they have been subject in the past.

The best way of administering physical examinations in the mining industry would be to have them conducted by properly constituted authorities of the various States. That is, if John Jones wished to work as a miner, when he appeared at the employment office of the Smith Mining Co., he would have in his possession a certificate from the State authorities declaring him to be free from organic or other defects that should, in the natural order of events, bar him from underground work. Such a system would presuppose reciprocity among the mining States and a basic standard of physical fitness. It would be well within the province of the Federal Government to establish such a standard for adoption

* U. S. Public Health Service. Chief, Division Industrial Hygiene and Medicine, Working Conditions Service, Dept. of Labor.

The third requisite consists of adequate provision for medical and surgical service so that minor illnesses and injuries may be promptly treated and not become of major importance. In regard to accidents, "safety first" has become highly specialized and efficient; health service, if I may use this term, has not been developed to the same proportion. While many of the larger mining companies maintain first-class hospitals, the prevention of sickness among miners has not kept pace with the prevention of injury. It is just as feasible to distribute posters and other educational matter dealing with the proper care of common colds, constipation, and other minor troubles, which are forerunners of serious ailments, as it is to impress on the miners the necessity of having the smallest injury promptly attended to by the company doctor. There is need for a closer co-operation between the doctors and the miners in handling the minor ailments when they first apepar. In former days the miner was an English-speaking person with all the advantages of a knowledge of the country and its institutions; at present underground workers are largely foreigners, and the employer must provide for their health during working hours, and often in their homes if he desires to keep them on the job.

It is probable that the mining industry will always be hazardous to health and life as compared with other industries, but at present it is needlessly so, because the wastage of human material can be prevented by securing physically fit labor, and by keeping its health unimpaired.

BRITISH COLUMBIA COAL PRODUCTION.

The production of the collieries of Vancouver Island for the month of February totalled 145,750 tons in comparison with 158,327 tons for the month of January. It should be borne in mind, however, that February is the shorter month. Still this does not altogether account for the decline. Nanoose Collieries, for instance, dropped to an output of 500 tons which is explained by the interference with work caused by the work of constructing a wharf. While the generally changed conditions of the past six months have had no very noticeable effect on the Island Collieries as yet, the producing mines being operated steadily and in most cases to capacity with results even better than when the war demand was at its heighth, there are slight indications that the urgency for output is not as great as it was. The work of opening up the Wakesiah Mine, which is situated near Nanaimo, B. C., and owned by the Canadian Western Fuel Company, has ceased temporarily and a short time ago the coal miners of Nanaimo were off for a Saturday afternoon.

Details of the production of the Island Collieries for February follow:

	Tons.
Canadian Western Fuel Company	59,104
Canadian Collieries (D) Ltd.	19,531
" " " " (Comox)	50,691
" " " " (South Wellington)	5,566
Pacific Coast Coal Mines (Morden)	4,719
B. C. Coal Mining Co. (Jingle Pot)	2,748
Nanoose Colileries	500
Granby Consolidated Mng. & Smelting Co. (Cassidy's)	2,891
	145,750

Of the above the collieries which show increases are the Pacific Coast Coal Mines, Ltd., and the Granby Consolidated Mininfi & Smelting Company. The Nanoose Collieries operated for five days only.

Details of the production for February in the Nicola-Princeton District follow:

	Tons.
Middlesboro Collieries Co., Ltd. (Merritt, B. C.)	3,935
Fleming Coal Company	3,729
Coalmont Colliery	800
Princeton Collieries	2,051

Both the Princeton Collieries and the Coalmont Collieries have increased their production in comparison with the results of aJnuary. In the case of Princeton the explanation of the improvement is that in the previous month a fire interfered with work.

As for the Crowsnest Pass Coal Field, there are no returns to hand as yet. The collieries, however, are authentically said to have operated only twelve days. A substantial reduction, therefore, is looked for. The reason for this slackness is found in the lack of demand in British Columbia for coke, following the closing down of the smelteries at Greenwood and at Anyox, particularly that of the Granby Consolidated Mining & Smelting Company at the latter place where a large quantity of the fuel is used when the plant is working to full capacity.

"By bringing the coal mining companies under the alternative of income tax or mineral tax, in common with other mining companies, we can hope for a revenue of $200,000 instead of the $160,000 estimated for the last year."

This statement was made by the Hon. John Hart, Minister of Finance in the British Columbia Government, when making his budget speech before the Provincial Legislature a few days ago. It is of special interest to the coal operators of the Province as it intimates the policy on which the Government has determined relative to the taxation of the coal mining industry. From the sense of the statement it is concluded that the report tha a straigh increase was to be made in the tax per ton of coal produced is without foundation, which will be a relief to these connected with the coal mining companies.

In explanation it may be said that the tax the companies now pay is 10 cents a ton. Returns of coal produced are made to the Government at regular intervals accompanied by taxation payments on the basis shown. Under the amendment which the budget speech of the Minister of Finance suggests it is understood that this rate will stand, the companies paying as heretofore, but, if at the end of the year, it is found that tax on a Company's income would realize more to the Treasury than has the 10 cents a ton, the Company will be required to pay the difference. In other words the Company will be taxed on whatever basis is found to bringing the greater amount to the public exchequer.

It must be understood that there is no definite assurance as yet that this is the Government's policy because the bill amending the taxation Act is not before the House up to the time of writing, but it is the only interpretation that can be placed on Mr. Hart's budget speech and operators are satisfied that nothing further will be done this year. As far as can be gathered there is no particular objection to the proposal though there would have been to any suggestion that the tax on the per ton production be raised. The

argument brought against such a move is that British Columbia coal to a large extent comes into competition with that of the Province of Alberta and the coal of the latter Province is taxed only 5 cents a ton.

The "Sale of Shares" Act.

Yesterday's Canadian Press dispatch from Toronto which intimates the withdrawal of mining concerns from the scope of the "Sale of Shares Act, 1919," has caused a good deal of satisfaction in the north, where it was feared an interference with the sale of stock in mining companies might have a serious effect without achieving the desired results. It is considered as very probable the government will take steps to enforce existing laws with a view to prevent misrepresentation, rather than regulate sale of stock. The suggestion is being put forward that the Ontario Bureau of Mines be given jurisdiction over stock companies engaged in mining, is one that will be brought to the attention of Attorney-General Hon. I. B. Lucas, for consideration. The importance of the silver mining industry of this district is further emphasised to-day in a review of the figures which show the output up to the beginning of the current year. This district has a total precious metal production of $216,627,283 to its credit, of which $169,241,387 is credited to the silver mines.

Interests engaged in the gold mining industry of the north have more reason to be pleased over the outcome of the "Blue Sky" bill than even the silver mines. The reason for this is the fact that many new companies are necessary if the many excellent gold mining prospects are to be explored efficiently. In the Porcupine field mining activity is gaining momentum each day. A similar condition prevails in Kirkland Lake, and in the Boston Creek field. Summer should see the majority of the mines in full operation. In the Kirkland Lake field it is officially announced the mill of the Kirkland Lake Gold Mines will be set in operation on Monday, March 1st. It is also officially declared the merger of the Tough-Oakes with the Burnside and the Sylvanite is nearing successful conclusion .

During the last two years a considerable amount of money coming from the Mines Department Fund, has been expanded in this District in building and improving roads and trails to mining camps and properties. This policy, by providing transportation to these hitherto inaccessible sections will undoubtedly within a short time give results in the shape of increased production.

At Harpers Camp on the Horsefly river and on Black creek a tributary of that river, there is renewed interest in the placer possibilities. The plant of the International Dredging Company at Harpers Camp was completed last season and a short test-run was made. This Company is using a mechanically operated scraper for digging and elevating the gravel to a flume where it is washed. The system as applied to placer mining being a new one. The work next season will be closely watched, because, if successful, many deposits of lowgrade gravel which cannot be worked hydraulically, could be mined by this method.

Drilling of the deeper ground at Harpers Camp to find the continuation of the rich channel worked out by the old timers may be carried out this summer by the Government.

The present high price of platinum has caused renewed interest in the occurrence of this metal in the black sand of the Quesnel river. It has been known for many years that some of this black sand, which is a concentrate from the panning of the stream gravels, carries variable amounts of platinum.

At Twenty-mile creek, the Quesnel Hydraulic Gold Mining Company has installed a mill in connection with the hydraulic plant to save this black sand. From the old Bullion mine some platinum was always recovered when the pit was in operation.

LOOKING FOR FOREIGN EXPORT TRADE.

The Sullivan Machinery Co. has established a Foreign Trade Department, and plans to increase its export business. The company has well established branch offices at London, Paris, Santiago and Sydney. Engineering agencies handle Sullivan products in Christiania, Amsterdam, Gijon, Turin, Algiers, Tunis, Johannesburg, Durban, Shanghai, Tokio, Lima and Buenos Ayres.

COAL WASHING TABLE.

The Deister Concentrating Company has issued a special bulletin describing "the No. 7 diagonal deck coal washing table."

The company has recently published its general bulletin for 1919, descriptive of the Deister-Overstrom diagonal deck types of ore concentrators.

METAL PRICES ADVANCE.

There has been during the week ending April 5 a stiffening in metal prices.

Prices on car load lots in Toronto on April 5th are: Copper, 17 cents per lb.; lead, 6⅛ cents per lb.; spelter, 7.20 to 7.25 cents per lb.

This spelter price is for April only. A premium is being asked for May and June.

During the week copper advanced ¼ to ⅜ cents per lb. Lead was about the same as last week, but shows more strength. Spelter is stronger than last week.

FIDELITY MINING AND DEVELOPMENT CO.

The Fidelity Mining & Development company is developing property which adjoins the La Belle Kirkland, north of Kirkland Lake. In a report to the directors manager R. R. Tough says: "During the month of January very little work was done with the exception of hauling in supplies, cutting roads and performing thirty days' assessment work on the south claim of your company in the Township of Teck, adjoining the Fisher property, where we uncovered a very promising vein. During the month of February the cookery was completed. A bunk house to accommodate eighteen men has been built, also an office, pump house, magazine, powder-thawer, blacksmith shop and a power-house. Machinery consisting of boiler, three-drill compressor and hoist, has been installed. Timber has been cut and framed for headframe, also for thirty feet of shaft.

"The shaft on the east 'Lavallie' claim has been dewatered and enlarged and some sinking has been done. The vein looks very promising, being heavily mineralized and showing considerable molybdenite. Two hundred feet east of the shaft in the low ground the vein is four feet in width and shows free gold. This gives us reason to anticipate fair values at 100 ft. level, which we expect to reach during the early part of April."

Special Correspondence

NORTHERN ONTARIO.

Gold and Silver Production.

According to official statistics now to hand the total production of gold and silver from the districts of Northern Ontario, up to the beginning of 1919, amounts to $216,627,282, which has been produced since 1903. The silver mines of Cobalt produced $169,241,387. The gold mines of Porcupine produced $44,578,909, while the gold mines of Kirkland Lake show a production of $2,806,987. This summary of the production of the district up to 1919 does not include a small output from a number of properties in districts not definitely associated with the Cobalt, Porcupine and Kirkland Lake camps. Of the above huge production of the mines it is estimated that approximately forty-two per cent. of the total amount has been returned to shareholders in the various mining companies in the form of dividends, thereby adding to the wealth of the world to the extent of $91,065,110.04. Very few precious metal mining camps in the world can show a record of such high dividend return on gross production.

Porcupine Crown.

Considerable underground work has been done at the Porcupine Crown Mines at Porcupine, since the recommencement of operations several weeks ago. Mr. Harry Harling, manager of the property has been absent for some time, the work being in charge of the mine captain. Mr. Darling will return to the property in the course of a few days and immediate steps will be taken to place the mill in operation. An unfortunate cave-in occurred at the property some time ago, causing the displacement of a large tonnage of rock and blocking a portion of the underground workings. But for this mishap, it is highly probable the mill would already be in full operation. The tonnage of ore broken in the various stopes of the mine is sufficient to keep the mill in operation at full capacity for a period of six months without drawing on the unbroken ore reserves of the mine. The grade of ore at the Porcupine-Crown is slightly higher than that at either the Hollinger-Consolidated or McIntyre mines averaging between $10 and $11 per ton. While the estimated ore reserves now total upwards of half a million dollars, there is also a large tonnage of mineralized rock which may in due course be included in the ore reserves of the mine, providing costs decline to a point on a level with that prevailing before the war, which would allow of a profit on its treatment. In the meantime the main workings of the mine are being continued from a depth of 1,100 feet to 1,400 feet and should add materially to the already large known ore reserves. Diamond drilling in an endeavor to locate commercial ore bodies on other portions of the property are also in progress. Thus, with a cash surplus of upwards of a quarter of a million dollars now on hand and the early commencement of production at full capacity at the property, the company is expected to be in a position to recommence the disbursement of dividends at the rate formerly inaugurated (3 per cent. quarterly or 12 per cent. per annum), in the near future.

Decision of Commissioner Upheld.

The decision of the Mining Commissioner, T. E. Godson, K.C., in the case heard last November, regarding the Howey-Counchenour claims in the Lightning River district, has been upheld by the Appellate Division of the Supreme Court of Ontario. The dispute was one filed by R. N. Austin against W. M. Counchenour, L. B. Howey, M. R. Howey and G. F. Martin, and involved a mining property in the Lightning River district on which two promising gold discoveries have been made, and had to do with an agreement a portion of the conditions of which had been complied with by the claimant Austin. The decision rendered by the Mining Commissioner and upheld by the Appellate Court was in effect that the case be dismissed, Austin paying the costs of the case on the County Court scale, the records of the case to be filed at the recording office at Matheson, Ont.

Hurricanaw.

Revival of interest in the Hurricanaw River district is apparent, and considerable new interest is being evinced in connection with the recent developments. A small mill (the only one in the district for treating gold ore) has been installed on the Martin property. While a good deal of encouragement has been met with, the production from the Martin has been of a more or less erratic nature. The shaft on the property has been driven to a depth of 90 feet and will be continued to a depth of 125 feet, where the lateral work will be enlarged upon. The mill on the property has a battery of ten stamps.

On to Hudson Bay.

Prospectors generally are keenly alive to the tremendous possibilities likely to follow the extension of the T. & N. O. Railway in the movement which has now come to be known as the "On to the Bay" project. If this railroad is built a large area of land will be made accessable to prospectors which offers great inducements to men following the profession to exert their energies in this direction. Very few prospectors have paid any attention to the regions north of the T. C. R. Lignite of an inferior quality has been found on the Mattagami river. Not only will the mineral possibilities of the district attract attention, but also those of lumbering, fishing and power development should also come in for attention.

More Development Work Possible Now.

One of the most conclusive evidences of the improvement in the labor situation in the North Country is to be found in the fact that no difficulty is now experienced in securing men for the performance of development work on mining claims. Already some of the urgent spring work is under way, while parties are leaving for the various districts from day to day and others are making arrangements for the prosecution of extensive explorations and general prospecting during the spring and summer months, and in some cases fairly large parties are being formed to work claims on which extensions have been granted during the past two years, owing to scarcity of men to perform the necessary work required by law. Up until the present time, the majority of prospectors have been going into the Boston Creek area, which is close to the railway and easily accessible.

Alexo Nickel Ore.

The shipments of nickel ore from the Alexo Mine at Porquois Junction during the second week in March amounted to 408,000 pounds, and was contained in four cars. This compared with three cars during the first week having a total weight of 310,000 pounds and makes a total of 718,000 pounds for the first half of the current month. It is therefore evident that the present month's shipments will come close to the record if not establishing a new record for production for any monthly period of the company.

Boston Creek.

Following the announcement of results met with in the diamond drilling of the Cotter property in the Boston Creek district comes the news of increased interest in the immediate district. It is learned that among other deals pending is one where the vendors have under consideration an offer of $200,000 for a small group of claims on which practically no development work has so far been done. When the high values were first encountered on the Miller-Independence, it was the general opinion that such a rich orebody would not be found to run far. However, at a vertical depth of 492 feet, the drill operating on the Cotter cut a vein more than 28 feet in width, and with an average gold content of $12.42 to the ton. It then became evident that the great body of ore was consistently continuing to the east, and although not so rich as on the Miller-Independence, it nevertheless indicates a great future for the Cotter. In this connection it is interesting to note that the Hollinger Mine, now conceded to be one of the largest gold mines in the world produced nearly ..6,000,000 from ore averaging a little under $10 per ton in 1918, and according to the last report had $41,000,000 in ore reserves which average $9.15 per ton. Thus the indication of the big vein with $12.42 in gold to the ton on the Cotter stamps this property as one of major importance, which may reasonably give added impetus to the entire Boston Creek camp, which promises to be the scene of extensive and far-reaching developments during the next few months.

Lucky Baldwin.

Work is being resumed on the Lucky Baldwin property, which lies about five miles southwest from the proven mines of the Kirkland Lake Gold camp, near Kenogami Station on the T. & N. O. Ry. About two years ago a small mining plant was installed on the Baldwin and a considerable amount of development work was done with a fair degree of success.

La Rose Report.

The twelfth annual report of the La Rose Mines, Limited, recently issued, showed a surplus as of December 1st, 1918, of $456,046 after paying a 2 per cent. dividend during the year. Silver production during 1918 amounted to 228,556 ounces, which showed a net profit of $45,544. What was gained in the price obtained for the silver 99.83 cents per ounce, was largely offset by the increased cost of production, which was 87.17 cents per ounce, due to the increased cost of labor and supplies. As no new ore was discovered in the parent mine, the La Rose, and all the dumps have been milled, this mine may be said to be nearing exhaustion. A limited tonnage remains in the Lawson property dumps. Some ore was located in the Princess Mine. There, ore is being broken with "sufficiently satisfactory results to justify further investigation," and preparations are being made to unwater the second level for this purpose. A new level was opened on the Violet Mine. There, and elsewhere an ore shoot about 60-feet long has been proven. This ore is said to be "erratic," but "there is a certain amount of high grade and the adjoining rock carried milling values." Other work is proceeding on this property. An option has been taken on a silver prospect in the Kamloops District, British Columbia, and this is being developed. The La Rose surplus consists of $253,533 in cash and call loans, $100,000 in Victory Bonds, $9,081 in accounts receivable, accrued interest and supplies, and $107,544 in ore in transit, at the smelter and at the mine ready for shipment. Since the foregoing report was issued important developments are understood to have taken place at various portions of the company's Cobalt property. At the present time interest in the company's affairs centres around the dispute as to the ownership of a certain piece of land on the boundary line of the La Rose and O'Brien mining properties, on which the shaft from which the La Rose is developing the Violet claim, is situated. The case comes up for hearing early in April, and is attracting a good deal of interest and is of vital importance to the La Rose.

McKinley-Darragh.

The new electric pump for pumping the sands and slimes from the bed of Cobalt Lake to the McKinley-Darragh-Savage Mines new oil flotation mill has been installed and work will be resumed in this portion of the plant during April. The new electrically driven pumps replace the automatic bucket drag used last summer and fall and will keep the mill operating at capacity.

Offered $1,000,000 for Kirkland Lake Gold Mine?

Unofficial reports are in circulation throughout the north to the effect that the Beaver Consolidated Mining Company has been offered a million dollars for their Kirkland Lake Property, the Kirkland Lake Gold Mines, Limited. The general opinion prevailing in mining circles throughout the district is that with the property at a point where production can be commenced at any time in the new 150-ton mill, and the property developed to a depth of 700-feet there is very little likelihood of the Beaver-Consolidated considering even this tempting offer, which is equal to about fifty cents per share on the stock of the company.

Hollinger.

According to reports from Porcupine, it is probable the Hollinger Consolidated Mining company will be operating at full capacity before the end of the current month. The Hollinger milling plant has a maximum capacity of about twenty-eight hundred tons per day. It is thus apparent that the output of the property from this time forward will show an increase of about fifty per cent. above that of the past year, when the total production amounted to close to six million dollars. The company have over forty million dollars in ore reserves, of an estimated value of $9.15 per ton, and a large acreage of virgin ground with numerous undeveloped veins.

Lake Shore.

During the month of February the Lake Shore Mines of Kirkland Lake produced $41,605, as compared with $45,162 during the preceding month. The slight decrease was due to the shortness of the last month. The January output averaged $1,456 daily, while that of February amounted to $1,485 daily. The official report of operations at the mine for the month of February were as follows:—

200-foot level.—The drift on No. 2 vein east was advanced from 380-feet to 482-feet.

400-foot level.—On No. 1 vein West, north branch, a raise was started to connect with the third level workings, the total advance being 15 feet. The drift on No. 1 vein west, north branch, was advanced from 491 feet to 542 feet. At 523 feet a fault was encountered and a drift was run south on same for a distance of 29 feet.

On the No. 1 vein west, south branch, the crosscut was advanced from 49 feet to 65 feet. The north branch of the No. 2 vein east was advanced from 453 to 463 feet, while the south branch was driven ahead from 452 to 465 feet.

The No. 2 vein west, was advanced from 214 feet to 248 feet.

Milling.—The mill ran 98.8 per cent. of the possible running time, reducing 1,651 tons of ore and recovering therefrom $41,605.21.

The foregoing report designates that the greater portion of the development work for the month was done at the lower levels of the mine. The general efficiency of the mill is demonstrated by the fact that the plant ran 98.8 per cent. of the possible running time, treating on an average of 59 tons of ore daily, with an average gold content of $25.20 per ton.

The dividend declared by the company (payable Thursday, March 27th), was the third disbursement since the commencement of milling operations in March of last year. The disbursement was 2½ per cent, and called for a distribution of $50,000. Although the earnings of the company are greater than 2½ per cent quarterly, the dividends up to the present time have been of an interim nature, permitting of the accumulation of a substantial surplus, such as the importance of the mine warrants. The performance of the property during its first year of operation from a milling standpoint is highly gratifying to the shareholders, who have participated in the distribution of profits to the extent of $150,000. With an enlargement of operations the earnings of the company could also be increased, permitting of more liberal profits for the shareholders. The future for the Lake Shore looks very bright.

Will Work in Skead Township.

Among companies which are contemplating a resumption of work in Skead township is the Lincoln-Nipissing Mining Company. A number of other companies are making arrangements for extensive development work in the district during the coming spring and summer months, and it is anticipated Skead township will experience its most active days in the near future.

Taking on Miners at Dome Mine.

Announcement has been made that a full force of underground workmen will be working at the Dome mine by the end of the current week, and milling operations will be in full swing about the middle of April. The ore broken in the mine is sufficient to keep the mill in operation for a considerable time. According to the last report of the company, upwards of 400,000 tons of ore of an average value of $5.10 per ton was broken in the stopes ready for hoisting to the mill, while the total ore reserves blocked out at the property above the 700-foot level is close to $10,000,000. The mill at the Dome mine is the second largest in the camp, having a capacity of between 40,000 and 45,000 tons per month. Previous to the war the costs of treatment and mining at the Dome Mine was less than $2.50 per ton of ore treated, and on the treatment of ore of a general average of less than five dollars per ton the company was able to pay dividends of 20 per cent per annum. Thus, while a large amount of the surplus in the treasury at the time of closing the mill has been spent in developing the lower workings of the mine and installing machinery for the more economical handling of the ore, sufficient funds are still available to carry the company to the producing stage again, and it is confidently expected earnings, with increased efficiency in various branches of the big mill, will be materially increased, permitting of the company resuming dividends again in the near future.

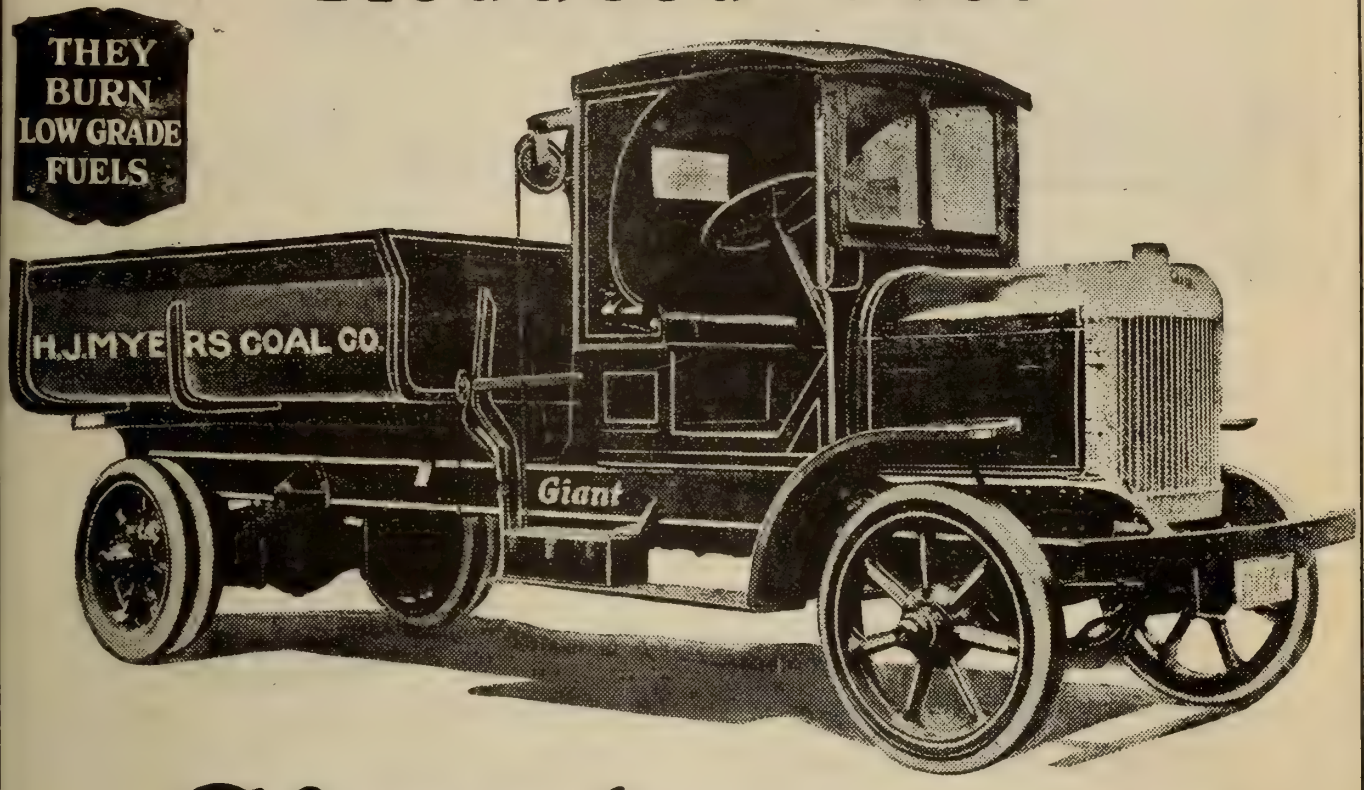
Shipping Ore From Salmon River.

Mr. B. Bush, of Vancouver, who has just returned from the North, states that $50,000 worth of ore per month is being shipped out of the Salmon River Mining District of British Columbia. The shipments are from the old Salmon-Bear River Mining company's property, now being developed by R. K. Neill, of Spokane, Wn. Mr. Bush, who is the original locator of this property, has great faith in it. He believes that it will make the Salmon River Valley District famous from a mining standpoint. He says: " Alarge minerfrom a mining standpoint. He says: "A large mineralized zone 400 feet wide has been traced for more six different claims. These claims are owned by the Premier Gold Mines, Limited, and the Bush Mines, Ltd., of Vancouver. Several ore shoots have been discovered in this zone, one of them being 110 feet wide and 1200 feet long." Mr. Bush states that a tunnel has been driven under his direction for 400 feet on this ore body, and that several crosscuts, one of them 90 feet long, have been driven without encountering the footwall. The ore he states carries high values in gold and silver.

Assembling Plant at Copper Mountain.

It is reported that advantage is being taken of the ready transportation facilities provided by the winter snow to hasten preparations for the opening of the Canada Copper Corporation's large new property and plant at Copper Mountain. Some heavy loads have been taken up the mountain on sleighs, the compressors and other machinery having been so conveyed to the mines for installation in order that the plant may be in shape for operation when the high power line of the West Kootenay Light and Power Co. is complete and the "juice" is ready to be turned on. The load which broke all records was a piece of electrical machinery weighing nine tons, which was hauled by 10 horses most of the time, but required an additional two over the heaviest of the grade. A 12 ton compressor wheel, in two sections, made two other comfortable loads of six tons each.

Dependable Service at Reduced Cost



Giant TRUCKS

The industry's greatest advancement is now available to truck users. **GIANT TRUCKS**, developed by the best engineering skill in America.

First to Burn Low-Grade Fuels

assure you dependable service and reduced fuel cost. Truck users will appreciate what an achievement this is for **GIANT TRUCKS**. They will understand what it means to them.

An exclusive **GIANT** feature enables this truck to attain full power on low gravity gasoline or mixtures of kerosene or distillate with gasoline. In burning low-grade fuels **GIANT TRUCKS** not only give maximum efficiency, but reduce fuel cost as much as 50 per cent.

Efficiency Plus Economy

That is what **GIANT TRUCKS** mean to truck users. This is the first truck burning low-grade fuels and making Giant truck owners independent of full reliance upon gasoline. Truck users must realize the possibility of further restrictions upon gasoline consumption, and the necessity for safeguarding their service,

GIANT TRUCKS are a war-time economy that truck owners cannot overlook. **BUILT IN 1, 2 AND 3½-TON MODELS.** Adaptable to every hauling need. Highly standardized throughout.

Safeguard your service with a GIANT TRUCK. Come in and see this truck to-day.

Mine Winding Engine for Immediate Disposal

Specifications:—

Double Drum, double Cylinder, direct drive high-speed Winding Engine, Cylinders 14 x 42. Reverse Link Motion. Pistons 21¼" diam. Cross head shoes adjustable to take up wear between the slides. Running in V shape slides; Length of Engine Bed Castings (suspended) from rear cylinder cover in centre drum shaft, 16'; Solid Crank Wheels 4' diam., 3½" Rim, keyed on to Drum Shaft 6½" diam. Hollow Drums, 3'6" diam. x 4' Winding Space, Flanges 3'. Each Drum fitted with adjustable Expansion Clutch operating inside outer rims. Each Drum fitted with Band Brake—operated by Independent Levers. Overhead Throttle with Drop Lever and Lubricator.

Lever Bank:—1, Engine Reverse Lever; 2, Brake Band Levers; 2, Clutch. Long Powerful Levers operating on floor stand quadrants.

GROWING POPULARITY OF LINK-BELT RESULTS IN OPENING MONTREAL BRANCH.

The ever increasing demand for Link-Belt throughout the Dominion and the desire to render customers in the eastern section a service in keeping with the high standard of Link-Belt Chain, the manufacturers have opened a branch at 1195 St. James St., Montreal.

A liberal stock of popular types of Link-Belt will be carried in stock at Montreal in the future from which all orders in that section will be promptly filled. This will not only enable the Canadian Link-Belt Company to render its customers a more prompt service than has hitherto been possible, but will also effect for them a considerable saving in freight and express.

For the present, the Montreal branch will serve largely as a warehouse, all engineering assistance being rendered by the Canadian Link-Belt Company at Toronto, where Link-Belt is manufactured for the Canadian market.

Although shipments for the Montreal and Quebec territory will be shipped from the Montreal branch, all correspondence should continue to be addressed to the Canadian Link-Belt Company, Toronto.

ELECTRIC MACHINERY.

The Jarvis Electric Company, 570 Richards St., Vancouver, B.C., has a large and complete stock of new and used electrical machinery, or they will contract to do your work as per specifications.

They handle the Diamond Grid Storage Batteries. Their engineering department is at your service.

MINING MACHINERY, ETC.

The Vancouver Engineering Works, besides being prominent engineers, are also doing a large business as boiler makers, iron and steel founders. They carry a line of riveted steel pipe, ore cars, buckets, as well as mining machinery, and Cornish pumps. A reliable firm to do business with.

HOISTS, STEAM SHOVELS, ETC.

Vancouver Machinery Depot carry a dependable line of hoists, steam shovels, scrapers, besides a large engineering and machinery department, which is among the most prominent on the Pacific Coast.

LUBRICATING OILS.

The Black Bear Sales Company, 207 Bower Bldg., Vancouver, carry a full line of lubricating oils and greases. They claim it is a "Bear for Wear."

Their Pacific Coast business is fast increasing, and if you have not tried their goods it would be worth your while to do so.

British Columbia Chamber of Mines

Dominion Bldg.. Vancouver, British Columbia

Opportunities for development and investment in the Mining industry in British Columbia are unsurpassed.

Our information bureau is at your service.

Correspondence invited.

Visit our reading room, library, and ore exhibit.

Lectures on mining and allied subjects are given during the winter months by University Professors and well-known Mining Engineers.

Become a Member (annual membership fee, $5.00), and keep posted on Mining developments in British Columbia.

For further information and literature concerning the mineral resources of British Columbia, write to the Secretary.

CHAIR OF MINING.

The Governing body of the Imperial College are now prepared to receive applications for the post of Professor of Mining in the Royal School of Mines, shortly to become vacant. The new Professor will be required to take up his duties in September, 1919.

The Rector of the College will be glad to afford further particulars.

Oxy-Acetylene Welding and Cutting

More Strength with Less Weight In Production and Repairing

This illustration shows a Prest-O-Lite operator welding parts in the production of intricate machinery, where strength and lightness are essential.

The Prest-O-Lite Process of Oxy-Acetylene welding has been adopted as standard practice in thousands of factories, mines, machine shops and shipbuilding plants, both in Canada and United States.

In production, this process results in greater strength with reduced weight, and effects substantial savings in cost of material and labor.

Prest-O-Lite PROCESS

is not limited to production work. Its value in repairing is universally acknowledged. Worn and broken metal parts are quickly reclaimed and put back into useful service, avoiding costly tie-ups and delays. The actual saving on one Prest-O-Lite repair often more than pays for the entire welding outfit.

The Prest-O-Lite process employs both gases (acetylene and oxygen) in portage cylinders. Prest-O-Lite Dissolved Acetylene (ready to use) is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Manufacturers, Mining and Production Engineers will find our welding literature full of valuable data and helpful suggestions. It may help you to reduce your costs and improve your methods. Write for it to-day.

CANADIAN COAL AND IRON AND THE TARIFF.

It should by this time be plain to all who have followed history since August, 1914, that the possession of coal and iron deposits, and their utilization in the arts, is a first requisite of national commercial importance, and also a first requirement of national defence.

The world may be—we sincerely trust it is—about to see disarmament and the abolition of conscript armies raised for the purposes of aggression. But the realization of ideals has time and again eluded the world when realization seemed most imminent, and in the questions of national armament there is no middle course. Either this world is about to see armies and navies reduced to small forces adapted for police purposes, or it is about to see armaments on a scale which even we in our day have not conceived.

Where does Canada stand in the matter of coal and iron supply? The iron and steel industry, which is mothered and fathered by coal supply, has now risen to be one of the most important single branches of industry in the Dominion. The disturbing feature is that this grat superstructure of industry is reared on a shifting foundation, namely, a protective tariff, and is moreover dependent upon an outside source of supply for the raw material, because out of 2,242,337 tons of iron ore charged to furnaces in 1918, only 96,745 tons was ore of Canadian origin.

What about coal supply? The most thickly populated centres of Canada, the most highly industrialized, are, with the exception of the sporadic urban districts of Nova Scotia, utterly and entirely dependent upon United States coal at the present time.

What is the inevitable result of economic dependence? Is it not political subservience, sooner or later?

Canada has a coal production of 15,000,000 tons annually, and her iron ore production is negligible. The United States has an annual coal production of between 700 and 800 millions of tons, and the greatest output of iron ore in the world.

There are just two courses open to Canada. She can shape her fiscal policies so as to encourage the development of her coal and iron resources, thereby assuring herself of a modicum of political independence and some powers of military resistance, or she can resign herself to depending on the United States for coal and iron, or in other words, can place our country unreservedly at the mercy of our neighbors. There is the issue. We express no opinion thereon.

It is reported that the Canadian Pacific Railway has asked Parliament for authority to build a railway from Lanigan, Saskatchewan, to a point near the Carrot and Saskatchewan rivers, west of The Pas, Manitoba, to a point near Cumberland House. Such a line would serve good agricultural areas but it is the possibility of further extension to Northern Manitoba mineral areas that makes the news of particular interest to us.

CLASS LEGISLATION FOR ENGINEERS.

Some of the members of the Engineering Institute of Canada are conducting an active campaign in an endeavor to secure legislation which will make the engineering profession a closed corporation, such as that of medicine and law. Meetings have been recently held at which it was contended that great benefit would accrue to engineers by the securing of such class legislation.

Periodically some of those interested in engineering societies take up this question. Some engineers really believe that engineering societies should exist solely for the benefit of the members rather than for the benefit of the community. Naturally, therefore, they estimate the success of the society wholly by the individual benefit to be derived from its activities. They would attract engineers to such a society by claiming that the society will secure for its members some special privileges.

There is no good reason why engineers who consider their profession underpaid should not form unions as other workers do, to sell their services at a proper price. We agree that technical trained men in this country, on the average, are not receiving proper compensation for their labor. But we do not agree that any class of workers, be they engineers, drill runners or bricklayers, should be given, by legislation, exclusive rights to work at a given profession or trade, unless the determination of the qualifications of workers is undertaken by the Government. No engineering society should be allowed to usurp the functions of government.

It is sometimes argued that mining engineers should join the Engineering Institute of Canada, because that society is very active in the interests of its members, while the Canadian Mining Institute is not. The Mining Institute can well afford to lose those who would change their allegiance for such a reason. The Mining Institute is organized on a plan which does not allow service to members to be placed on a level with service to the industry. If there is any advantage it must come indirectly, as a recognition for service to the industry and the community. We are quite willing to admit that there are other and better reasons for appealing to mining engineers to join the Engineering Institute. We believe that, for many, membership in both Institutes would be desirable. But we do not get a higher opinion of the Engineering Institute for such activities as this campaign for class legislation. We are pleased to see signs of vigorous life in the Engineering Institute, and we wish it every success in its other activities. We hope, however, that in this effort it will fail.

The new haulage slopes at the Nova Scotia Steel & Coal Company's mines at Wabana are a little over two miles long. With these completed, the company has quick and easy access to its main ore deposit. The mining of this ore will be one of the greatest of submarine accomplishments.

VOCATIONAL TRAINING FOR RETURNED SOLDIERS.

Some idea of the work being done by the Vocational Training branch of the Department of Soliers' Civil Re-establishment was given last week at a meeting of the Royal Canadian Institute, Toronto. Knowing that the man in charge of this work for Ontario is a mining engineer, Mr. H. E. T. Haultain, Professor of Mining in the University of Toronto, and that the whole department is under the direction of another mining engineer, Mr. W. E. Segsworth, of Toronto, our readers will be particularly interested in what is being accomplished.

About 150,000 Canadians have been wounded in the war. An attempt is being made to help all these men to overcome their disabilities. To a large extent the effort has been successful. The department workers begin their work with the returned men in the hospitals. In Ontario occupational work, such as weaving, basketry, wood carving, leather work, metal work, etc., is taught the men by aides trained by the Ontario branch at the University of Toronto. There have also been established curative workshops, where shoemaking, carpentry and other occupations are taught.

When a man is discharged from the hospital he is given the opportunity of training for a suitable position. A Board comprised of one medical man, the vocational officers and one layman outsider connected with the industry, helps in the selection of the occupation, arranges for teaching, secures a position for the trained man, and takes an interest in him until he is satisfactorily engaged in a suitable occupation.

Speaking of the work of this board, Prof. Haultain said:

> "This staff examines commercial plants and and factories, and makes arrangements for courses, being constantly in search for jobs wherein disabled men can be retrained. Each operation in industry is considered from the point of view of the disabled man. Our inspectors visit these industries weekly and report on the mans conduct and progress.
>
> "This staff keeps track of all retrained men in Ontario. They are visited at their homes and occasionally at their places of employment. By means of these visits and by correspondence, a complete record is kept of every retrained ex-soldier.

The work in which Mr. Segsworth and Mr. Haultain are engaged is proving very successful. Hundreds of men have been retrained and hundreds are applying for training. There are now in Ontario classes 2,300 men. In the other provinces also the work is being carried on, the numbers being naturally smaller.

We understand that in placing men back in industrial occupations the Department has found mine managers very willing to co-operate. With the example of Segsworth and Haultain before them, they will not be satisfied until they have done much more than is expected of those in other industries.

Mr. T. J. Flynn, superintendent of Matachewan Gold Mines, who has been in New York for some time, is again at the Otisse property, work there having been resumed.

MR. SEGSWORTH'S WORK.

Walter E. Segsworth, Director of Vocational Training of the Department of Soldiers' Civil Re-establishment, has resigned. He will represent Canada at the Inter-Allied Conference on the re-habilitation of the disabled soldier, which is soon to be held at Rome, and will then take a rest before returning to private business.

He has been Director of Vocational Training since July, 1917. He will be succeeded by N. F. Parkinson, who since he returned from overseas has been Mr. Segsworth's assistant. In announcing Mr. Segsworth's resignation, Sir James Lougheed, Minister of Soldiers' Civil Re-establishment, says:

"Mr. Segsworth is one of those true Canadian citizens, who, during the war have done their part in solving war-time problems without considering their personal gain. Ever since he undertook this work at my request, he has devoted his entire energies without remuneration, to a problem for the solution of which there were no precedents, and which was of the complex character. He conceived the principles of industrial re-training along original lines, secured the sympathy and co-operation of educationalists, organized labor, and employers, and developed quickly a nationwide organization for the conduct of the work effectively and economically. In conceiving the plan for the rehabilitation of the disabled soldier, he applied the knowledge he had from university and technical training. In the building up and administration of the large organization necessary, he applied the principles he had found successful in the large commercial enterprises he has directed. The success of his efforts is a credit to pure Canadian enterprise and ability. Testimony that Canada is in the forefront in the possession of a comprehensive and successful national scheme of rehabilitation for disabled soldiers has come from all the allied nations."

NORTH CANADA EXPLORATION CO.

The mining machinery of the Sultana mine, at Kenora, is being shipped to the Pas, for use at Mile 194 on the Hudson Bay Railway. The North Canada Exploration Company are the owners of this machinery, and also owners of the Sultana mine. Last September they purchased from John Forbes eight mining claims situated a short distance off the railway, at Mile 194, for $280,000. A shaft 75 feet in depth, was sunk on one of the claims, and assays of the ore encountered went as high as $300 to the ton in copper, gold, nickle and silver.

These eight claims are to be incorporated into a company, to be known as the White Bear Mining Co., and active mining is expected to be carried on about June 1st.

Mr. John Forbes, the locator of this discovery, says the orebody is twice as large as the Mandy and Flin-Flon put together. He points out that it has a 72 foot lead, and runs for 7,000 feet without a break.—The Pas Herald.

H. C. Carlisle is leaving the Mandy mine for France. Mr. Carlisle is interested in the engineering designs of reconstructing the devastated portions of the French battle fields. He may go with a body of American engineers. The Mandy will close down further operations pending the arrival of a railway from The Pas. It is estimated that 180,000 tons of low grade ore lies undeveloped in the mine.

Annual Meeting of Mining Society of Nova Scotia

The 26th Annual Meeting of the Mining Society of Nova Scotia will be held in New Glasgow on the 23rd and 24th of April. The President, Colonel Thomas Cantley, will be in the chair. Following is provisional programme of the proceedings:

Wednesday morning, the 23rd, will be taken up by ordinary business, and the presidential address.

In the afternoon papers will be presented as follows: "Salt & Salt Mining," by Mr. L. H. Cole, of the Department of Mines. This paper will have special reference to the recent discovery of rock-salt at Malagash, Nova Scotia, which was described in a recent nuumber of the JOURNAL.

Mr. C. M. Odell, Resident Engineer of the Dominion Coal Company, will speak on "Romance and Rascality in Coal Mining," two subjects on which he is especially qualified to speak. Those who heard Mr. Odell speak last year in Sydney on "Gas Engines" have pleasurable anticipations of his latest exposi tion.

Lt. George Morley, of Glace Bay, was formerly employed in the Survey Department of the Dominion Coal Company, and will describe tunnelling operations on the Western Front. This is a subject that will appeal to the Cape Breton members, who were so well represennted in the tunnelling corps.

Major J. W. Maddin, President of the Cape Breton Branch of the Great War Veterans' Association, who went overseas with the 185th Cape Breton Highlanders, will speak on the "Returned Soldier."

On Wednesday evening, Dr. A. O. Hayes, of the Geological Survey, will give an illustrated description on the "Origin of the Iron Ore Deposits of Wabana, Newfoundland." Those who are familiar with Dr. Hynes' monograph on this subject will look forward with pleasure to seeing microscopic slides of the boring algae which are believed to have played so important a part in the formation of the Wabana ores. It is expected that some interesting references will also be made to the early history of the development of the ore properties by members of the first prospecting parties.

On Thursday visits will be paid to the Shipbuilding Plant of the Nova Scotia Steel & Coal Company at Trenton, and to the Allan Shaft Colliery of the Acadia Coal Company at Stellarton.

In the afternoon a paper is anticipated detailing some of the recent geological discoveries and ascertained facts yielded by the prospecting work carried on for several years past by the Mining Engineer of the Acadia Coal Company. Some long-debated and much disputed conditions in the Acadia Company's area of the Pictou coalfield should be better understood, as the result of the information it is anticipated this paper will give the members of the Mining Society. An active discussion is looked for following the paper.

Mr. F. E. Lucas, the Economy Engineer of the Dominion Steel Corporation, will speak on the "Market for Nova Scotia Coal," and Mr. J. D. Kendall, of Sydney, will give a paper on the "Formation of Coal."

Further papers are anticipated dealing with some remarkable economies that have been effected in the use of compressed air underground by the check afforded by an air-meter, with some remarkable tonnages that have been released in limestone quarry operations by one blasting operation, and a paper is also looked forward to which will tell of a submarine mining operation in Nova Scotia where a thin seam of coal is entirely removed in undersea territory by electrical coal-cutters, and the use of the long-wall method of extraction. So far as is known this colliery is carrying on unique practice in Nova Scotia, and it is hoped this paper will be presented.

The meeting will end with a smoking concert.

The Nova Scotia mining men are anxious to see visitors from the West, and any who can make the trip will, in addition to receiving a warm welcome, hear some papers worth while, and will, we believe, not be disappointed in the discussions.

The Canadian Mining Institute will be represented at this meeting by Mr. D. H. McDougall, who, in addition to being President of the C. M. I., is also the past-President of the Mining Society of Nova Scotia. —F. W. G.

ROBERT BRYCE.

Mining Engineer, Toronto, recently elected a councillor of the Canadian Mining Institute.

-:- The Dolly Varden Case -:-

The Mining Committee of the British Columbia Legislature has submitted a report declaring that the Taylor Engineering Company, which met with financial disaster in the construction of a railway from the coast at Alice Arm, B.C., to the Dolly Varden Group of Mineral Claims, is justly entitled to payment in full of the cost of the work done plus 10 per cent contractor's profit. It is asserted that the evidence shows that the contracting company had assurances that its investment in the road, beyond the originally estimated cost, would be repaid and that, reposing confidence in these assurances, it went forward to the limit of its financial ability. Therefore the committee takes the position that the contracting company, and its creditors, should be fully protected before the Provincial Legislature consents to the renewal of the railroad charter.

Recommendations made by the Committee to the House may be summarized as follows:

That the charter of the Dolly Varden Mines Railway, which expired on December 31st last, be renewed to the Dolly Varden Mines company upon compliance with the conditions set forth in the draft bill accompanying the report; that in the event of the mines company and the engineering company being unable to agree upon the construction cost in 1918, it be referred to the Supreme Court to ascertain the cost, and that cost, together with 10 per cent thereof added for contractors' profits, be declared a debt owing by the Dolly Varden Company to the engineering concern; that the sum ascertained be a charge on the railway and all assets of the Dolly Varden Mines Company in British Columbia, subject only to a mortgage for $150,000 and interest in favor of Goldfields Consolidated, from which the Dolly Varden Mines Company borrowed that amount at six per cent interest, and which mortgage fell due on the 1st of January last, and to the balance of purchase money due to Donald W. Cameron in respect of the Wolf Group of Mineral Claims.

Further, the Committee recommends that all wages for work on the railway in 1918 be paid by the Dolly Varden Mines Company within fourteen days after the enactment of the Act presented along with the report; that the balance of the moneys due to the Taylor Engineering Company in respect of railway construction be paid within thirty days after the amount thereof is ascerained, and that, if the mines company does not wish to assume the burden of such payments, it must notify the Minister of Railways within one week after the adoption of the report by the Legislature in which event the Taylor Engineering Company shall have the right to acquire from the Dolly Varden Mines Company the railway and all assets, the mines company to be entitled to receive from the engineering company the amount of its investments in such assets. Also that in the event of the engineering company acquiring the railway and assets, it shall pay off the mortgage to the Goldfields Consolidated or otherwise protect the mines company against all claims and also the amount due on the purchase of the Wolf claims. Should the Dolly Varden Mines Company decide not to pay the cost of construction of the railway, and in the event of the engineering company exercising the right to acquire the line upon payment of the amount of the mines company's investment in the same, the latter concern shall be released from all claims in respect of construction of the railroad and be entitled to be paid by the Taylor Engineering Company the amount of its investment.

The draft bill which accompanies the report is a lengthy one, covering all contingencies which might arise from the taking over of the property by the creditors of the Taylor Engineering Company.

An important provision is that the renewal of the charter does not take place until he Dolly Varden Company has first complied with the conditions as to the paying off of the wage claims and securing the general creditors of the Taylor Engineering Company. This provision it is said, instead of being a hardship on the company, was designed by the Committee to safeguard the Dolly Varden Company from any attack through the courts by the Temiskaming Company under its option to purchase. It may be stated here, by way of explanation, that the Temiskaming Company holds from the Dolly Varden Company an option to purchase the Dolly Varden Group of Minerals Claims, the railroad and other associated assets, the consideration being $900,000. Without this provision, it is asserted, the Temiskaming Company would be in a position to bring suit for specific performance, forcing the Dolly Varden Company into a position where they would only have $150,000 or $200,00 left in return for the entire investment of some $640,000.

Should the Dolly Varden Company elect to let the engineering company's creditors pay off the wage claims and take possession of the property they will then be paid in full for their investment out of the profits of the mine, which was the way in which they were to be paid their balance of the $900,000, for which a sale had been agreed upon. The draft act embodies in toto the conditions of operations which the Dolly Varden Company had agreed to accept from the Temiskaming Company, with a clause added providing that in the event of dissatisfaction over the working of the mine and the division of the profits, the aggrieved party may appeal to the Supreme Court and have an independent receiver appointed.

Subsequent to the presentation of the report to the House, Premier Oliver announced that representatives of the Temiskaming Company had complained that they had not been given an opportunity to submit evidence to the committee as to their position. He stated that it was not intended that any interests, concerned in the development of the resources of the country, should leave feeling that they had not been given fair treatment. He therefore moved that the report be referred back to the select committee with power to hear any further testimony bearing on the matter that the company in question or any other parties might have to offer. This was carried.

The committee's report clearly outlines the entire situation as disclosed by evidence adduced and is interesting. It follows, in part:

The dispute between the two companies comes before the Legislature in the form of a petition by the Dolly Varden Mines Company for an extension of the time given to it under the "Dolly Varden Mines Railway Act" of 1917 in which to complete the construction

of the Dolly Varden Mines Railroad, and a cross-petition by the Taylor Engineering Company, Limited, contractors for the construction of the road, praying that such a renewal of the Dolly Varden Mines Railroad charter be not granted except upon such terms as shall constitute their claim for the unpaid balance of the charge for construction, amounting to approximately $462,500, as a lien uopn the assets of the Dolly Varden Mining Company.

Upon the following facts the parties are in substantial agreement: The Dolly Varden Mines Company, incorporated in the State of Delaware, has been developing a group of mineral claims near the Kitsault River, about eighteen miles distant from Alice Arm.

The mining company entered into an arrangement with the Taylor Engineering Company, Limited, for the construction of a line of railroad to connect the mines with tide-water. In pursuance of this object the mining company obtained from the Legislature in 1917 a public Act authorizing it to construct the road. Section 11 of the Act provides that all work must be completed before December 31st, 1918.

At the outset a light dinkey road was required, following the path of an existing pack-trail, with capacity to haul out daily 30 tons of ore or concentrates. The mining company, in its desire to have the road completed and the mine operating before the close of the year 1917, desired that the work should proceed at once without the delay involved in having the usual surveys made and quantities calculated. The Taylor Engineering Company, Limited, accepted the contract on a cost plus 10 per cent basis. A written agreement that the work would not cost more than $175,000 was given by the Taylor Engineering Company, Limited. This agreement, however, was, according to the evidence of Mr. Taylor, supplemented by a private verbal agreement whereby President Hubbard, of the Mining Company, agreed to see that any excess above this figure up to an extra $100,000 would be paid.

After the road was commenced, labour difficulties, the increased cost of materials, improved standard of construction required, and unexpected difficulties in engineering resulted in an expenditure during the first season of over $275,000 without the road being nearly completed. Mr. Hubbard observed the private agreement he had made to the extent of paying the contractor $70,000 out of the extra cost of $100,000, and work was stopped on the construction owing to lack of funds. Up to this point there is nothing in the relation of the two companies which calls for adjudication on the part of your Committee.

The present dispute arises out of the operations for the year 1918. Mr. Taylor was very anxious to complete the construction of the road. At the same time the shareholders of the Dolly Varden Mines Company, through Mr. Hubbard, were endeavouring to negotiate a sale of the property to the Granby Consolidated Mining, Smelting, and Power Company, Limited. Mr. Hubbard represented to Mr. Taylor that the Dolly Varden Company was unable to assume any financial responsibility for further work done upon the road, but assured Mr. Taylor that if he desired to go on at his own risk he would be fully paid in the event of the sale to the Granby Company being made. In the event of the sale to the Granby Company not being made, Mr. Hubbard stated that so long as the work done was done to the satisfaction of the Engineers of the Dolly Varden Company, the Taylor Engineering Company, Limited, would have all its just claims paid and be given proper compensation for engineering and contractor's profits out of any subsequent disposition of the mine.

The letter from Mr. Hubbard to Mr. Taylor, dated May 14th, 1918, is as follows:—

Vancouver, B.C., May 14th, 1918.

"Gentlemen,—I understand that you have proposed to Mr. Sylvester, of the Granby Company, that the Taylor Engineering Company should resume construction of the Dolly Varden Railroad and carry it on pending the examination of the Dolly Varden properties by the Granby Company; that if the Granby Company should elect to exercise its option and purchase the Dolly Varden properties, the Granby Company would reimburse the Taylor Engineering Company for the outlay and make satisfactory arrangements with you for the completion of the road. I understand that Mr. Sylvester has indicated a willingness to accept your offer.

"We are not concerned with any arrangement you may make with Mr. Sylvester in regard to the matter, provided the Granby does ultimately take the properties over; but in case they should not do so, it is obvious that your relations with the present owners of the property would become important and would require serious consideration.

"You are already fully informed of the limitations and conditions affecting the ownership and the policy of the owners at this time, and this knowledge will enable you to readily understand the position which I am compelled to take.

"The owners cannot and will not assume any liability whatsoever at this time. They will recognize neither a financial nor a moral responsibility to reimburse you, or to compensate you for this work in case the Granby Company does not buy the properties. They cannot and will not permit the properties to become subject to any lien for material, labour, or other charges. If the Taylor Engineering Company undertakes this work it will be necessary to have from them an instrument releasing the present owners from any financial or moral responsibility in the matter, and expressly waiving lien rights and protecting the property against such rights, not only as to the Taylor Engineering Company, but as to sub-contractors and material men.

"As against this, you can rely upon the following facts and assurances. If the Granby Company should not exercise its option to take over the properties, it is obvious that the present owners will either have to reorganize, complete the railway, and operate the properities themselves, or dispose of them to some purchaser other than the Granby Company. In either event and subject to the limitations stated below, I will personally assure you that any just claims you might have for the work done and materials furnished will be recognized and provided for either in case of reorganization or sale to others. Compensation for such claims would include not only a reimbursement, but proper compensation for engineering and contractor's profits. This assurance, however, presupposes that all work shall be done to the satisfaction of the owners, and will have to be approved by their Engineers, who would be the sole judges as to whether and how far the work would be acceptable.

"You may safely assume that the Dolly Varden properties with the railway constitute an asset of sufficient value to justify the assumption that any just claim you might have could and would be taken care of in the final 'work-out' of the proposition, and in any event. A final payment of $25,000 is due on October 1st next on the Wolf claims, and the Goldfield Con-

solidated Mines Company loaned $150,000 at 6 per cent, which is due January 1st, 1919, and for which the Goldfield Consolidated Company is entitled to a mortgage. This mortgage has not yet been recorded and its final form is yet to be agreed upon. I cannot personally guarantee it, but I have no doubt the payment on the Wolf claims will be made when due. In spite of the statement, the owners will not and cannot consider any arrangement which might create a lien upon the property, in case of foreclosure of the Goldfield mortgage, and failure to redeem by the present owners, arrangements could and would be made whereby you could redeem from such foreclosure.

"Yours truly, J. D. HUBBARD."

Relying uopn the undertaking given in the latter paragraph of Mr. Hubbard's letter, the Taylor Engineering Company, Limited, resumed construction-work in 1918. All parties were at that time expecting the sale to the Granby Company to be carried out, and the work upon the road was done to conform to the requirements of the Granby Mining Company, which required a road-bed of increased width with easier curves and capable of hauling 400 tons of ore daily. This work was done, as the correspondence shows, under the supervision of Mr. R. R. McGinnis, the Resident Engineer for the Dolly Varden Mines Company.

The work was carried on in 1918 on the credit and capital of the Taylor Engineering Company, Limited, which by the middle of July of that year was at the end of its resources; when the offer of purchase was finally made by the Granby Company, it was refused by the directors of the Dolly Varden Mines Company, owing to dissatisfaction over the proposed conditions of operation. The financial embarrassment of the Taylor Engineering Company was very well known to Mr. Hubbard and his engineer, Mr. McGinnis. On August 19th, 1918, Mr. McGinnis wired to his chief, notifying him in effect that the Taylor Engineering Company were at that date so far committed financially that they could not stop construction without financial ruin. On October 12th the Granby offer was refused. On October 22nd construction-work ceased and the Taylor Engineering Company assigned for the benefit of its creditors.

Since assignment, Mr. Taylor, in his efforts to enable the Dolly Varden Mining Company to obtain the money wherewith to pay off his claim, succeeded in bringing Mr. Hubbard and a representative of the Temiskaming Mining Company, of Cobalt, together. Mr. Taylor endeavoured to effect sale of the Dolly Varden properties to the Temiskaming Company at a price of $1,100,000, his services as an agent in the matter being given without charge. Since then, Mr. Hubbard, of the Dolly Varden Company, and Mr. Errington, representing the Temiskaming Company, have arranged for the sale of the property to the Temiskaming Company at a price of $900,000, which includes a commission of $50,000 to be divided between Messrs. Hubbard and Errington, this sale being conditional upon the renewal of the charter to the Dolly Varden Mines Railway.

The sum of $900,000 is insufficient to pay all parties without loss, and your Committee understands that the proposal of the Dolly Varden Mines Company, which claims to have invested $640,000 in the property, is that the charter for the railroad be extended on condition that they pay in full the wage claims for the construction of the road, amounting to approximately $150,000, and that the creditors of the Taylor Engineering Company divide with them the losses on the mine and railroad project.

It was urged by counsel for the Dolly Varden Mining Company that the President of his company, in his letter of May 14th, 1918, repudiating all moral and financial liability to the contractors, had no authority to bind the company to any undertaking in the event of a sale to the Granby Company not being carried out. Assuming this to be so, Mr. Hubbard having been allowed to assume the direction of the affairs of the Dolly Varden Mining Company, your Committee considers that it would be unjust to allow the Dolly Varden Mines Company to divest itself of liability for the construction of the railway, especially when the company is engaged in marketing the very labour and material which was placed on their property as a result of the inducements held out by its President in his letter of May 14th, 1918.

The correspondence and evidence showed that the work in 1918 was carried out without excessive cost under the supervision of Mr. R. B. McGinnis as resident engineer of the Dolly Varden Company, who reported to the President of his company on September 11th, 1918 (six weeks before work stopped): "The construction-work on the road has been well down throughout, and the only complaint we could make is that they had spent more money on the upper end than we intended to at this time."

Mr. McGinnis also says in the same report to his President: "If Granby takes the property it is all right, and if we keep it we still have a good road, but have a heavier investment than was absolutely needed at the start. We could have changed the road later."

The evidence of the Government Railway Engineers who inspected the line was, however, that the road only met with the minimum requirements, was not extravagantly built, and that had it been less well built they would not have taken the responsibility of issuing the company a certificate to commence railroad operations.

Your Committee, therefore, being satisfied on the evidence that the work was properly performed and that the Taylor Engineering Company resumed operations in 1918 on the promises made in the letter of May 14th by Mr. J. D. Hubbard, President of the Dolly Varden Mines Company, that the Taylor Engineering Company would be paid in full for its just claims, either from a sale to the Granby Company or "sale to others," feels that the Taylor Engineering Company is entitled to be paid in full for its "just claims . . . . for work done and materials furnished," to "include not only a reimbursement, but proper compensation for engineering and contractor's profits," to adopt the language used by the President of the Dolly Varden Company in his letter to the Taylor Engineering Company.

Your Select Committee points out that since the Dolly Varden Mines Company entered into the proposals to sell to the Temiskaming Mining Company for a price of $900,000, an offer of $1,100,000 for the property had been made by Mr. S. S. Taylor, K.C., on behalf of the creditors of the Taylor Engineering Company. This offer is without the payment of commission to any one, and if carried into effect would enable all the creditors to be paid in full and leave a sum larger by over $50,000 for the shareholders of the Dolly Varden Mining Company than under the offer of the Temiskaming Mining Company.

The Geophone

An Instrument for Detecting Sounds Underground.

The geophone, a listening instrument invented by the French during the war to detect enemy sapping and underground mining operations, and for the location of enemy artillery, is now being used by the U. S. Bureau of Mines, Department of the Interior, as a possible aid in locating miners who have been entombed after a disaster. The instrument was developed by United States engineers during the war, and is now used by the bureau according to plans drawn by these engineers.

Alan Leighton, assistant chemist of the bureau, who now has charge of these investigations for the bureau, has given the following statement of general information regarding the geophone:

The instrument, though small, is essentially a seismograph, since it works on the same principle as the ponderous apparatus with which earthquake tremors are recorded.

It consists of an iron ring about thre and a half inches in diameter, within the centre of which is suspended a lead disk which is fastened by a single bolt through two mica discs, one of which covers the top and the other the bottom of the ring. There then are two brass cap pieces, the top one having an opening in its centre to which is fastened a rubber tube, leading to a stethoscopic ear piece. These cap pieces are fastened with bolts to the iron ring, and serve also to hold the mica discs in place.

We then have really nothing but a lead weight suspended between two mica discs cutting across a small air-tight box. If the instrument is placed on the ground and any one is pounding or digging in the vicinity, energy is transmitted as wave motion to the earth, and the earth-waves shake the geophone case. The lead weight, on account of its mass and because it is suspended between the mica, remains comparatively motionless. There then is produced a relative motion between the instrument case and the lead weight. The result is that a compression and rarefication of the air in the instrument takes place. Since the rubber tube leading to the stethoscopic ear piece is connected with this space in the geophone, this rarefication and compression is carried to the ear drum. Usually two instruments are used, one for each ear.

When the two instruments are used, it has been found that the sound is apparently louder from the instrument nearer the source of the sound. It is evident then that by moving the instruments properly a point can be found when the sound will be of the same apparent intensity in both ears. The direction of the sound is then on a perpendicular to the line connecting the centres of the two instruments either in front of or behind the observer. Further observation will show which side. Direction is quite accurately determined in this way. The sound is not actually louder in one ear than in the other, but the ear is capable of distinguishing the difference in time at which the sound arrives in the two instruments. Since this is the case, persons who are slightly deaf in one ear are said to still be able to determine direction with the instruments.

During the period of the war, engineers of the Mining Division of the Bureau of Mines were engaged in determining the distance that different mining machines could be heard through the clay, shale, coal and the mine cover. Measurements were made also of the energy required in blows that they be heard definite distances through clay, shale and coal, as well as the distances at which shock waves resulting from the discharge of various explosives could be heard. A brief investigation of the factors influencing the transfer of energy from a mining tool to the clay and coal was also made in order that recommendations could be made as to the type of mining machine which could be used to accomplish the most work with the least noise.

In this connection it was found that sounds were transmitted only about half as far in clay as in shale strata and about one quarter as far in clay as in coal. To give some idea of the sensitiveness of the instrument it may be said that pounding with a pick on the bituminous coal can be detected for a distance of 900 feet, and the direction determined, and that pounding with a sledge can be heard as far as 1,150 feet. These measurements were made in the Pittsburg coal seam in the vicinity of Pittsburgh, where the coal is somewhat harder than in most other bituminous coal beds. The explosion of a one-ounce charge of dynamite was detected a distance of over two thousand feet through the shale strata. One interesting feature of the instruments is that the sound as transmitted to the ear is very characteristic of the instrument producing the sound. To illustrate: Twelve mining and carpentering operations were carried out on the coal rib. An engineer of the Bureau who had never used the geophones and who did not know what tools were to be operated was able to recognize and name nine of the instruments at a distance of several hundred feet through the strata. The other three sounds were accurately described, but the machines were not identified.

Now that the war is over the Bureau work has turned to the development of the instruments for peace time uses. In this connection it is thought they may be of great value to mine rescue crews who may be entering mines for exploration, and to locate miners who may have been entombed after a disaster. The tests so far made in the vicinity of Pittsburg show that a man pounding on the coal rib with a pick, piece of timber, or a sledge can be detected and located from a point 600 to 1,200 feet distant. This distance depends greatly on the character of the coal upon which the man is pounding, and intervening rooms and entries seem to have surprisingly little effect upon the distance or the determination of direction.

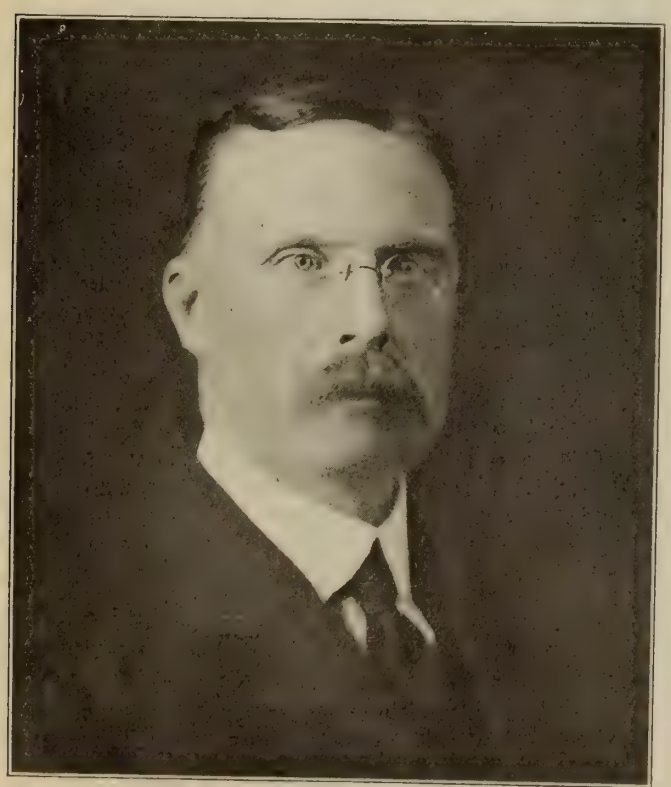
Pounding with a sledge can be heard from two to three hundred feet through the mine cover, depending upon the quietness of the day outside, since any wind greatly interferes with the successful operation of the instruments. It will at once be seen that when mines are not too deep they can be "explored" from the surface, and it will thus be possible to find and locate a miner who is pounding. At the Experimental Mine in Bruceton, Pa., a man has frequently been located through 140 feet of cover with 50 feet of the exact point where he was pounding. A study is also being made of the distances that pounding on rails and pipes can be heard. Since rails are generally buried in the earth or dust on the entries of a mine and since that dust damps the transmisison of the sound, the sounds are not transmitted very well. The same is true of pipe lines. However, if pipe lines are not

buried, but are laid on blocks and ties, the pounding can be heard great distances. So far no lines have been found long enough to show the limits of the geophones. It is known, however, that the naked ear can get sounds farther than 2,000 feet.

In metal mines expensive surveys have sometimes to be made in order that approaching tunnel headings may be brought accurately together. Since direction can be determined so well with the geophones, it is thought that they can be used to guide such work. It would simply be necessary to go into each heading and locate the direction from which pounding in the other heading was coming.

It is also thought that they will be of value to prevent accidents, from explosions when breaking through. In this connection an interesting incident happened recently. Observations were being made at a tunnel heading. The pit boss happened along and asked to be allowed to listen. He put the ear pieces in his ears and remarked: "Mack is tamping in a charge, we had better move away." He spoke as naturally as he would have had he been watching Mack, and it is quite evident that he did not realize the sound was coming through 300 feet of coal, else he would not have given the warning.

Observations were made recently of a mine fire burning from 20 to 40 feet below the surface. A low rumbling noise could be heard as if air were being drawn in along crevices, and occasionally sounds could be heard from the snapping and falling of pieces of coal or rock. As well as can be determined, the fire area was accurately located, but owing to the fact that the fire can not be approached from the inside the data can not be checked absolutely. It is interesting to note that similar sounds could be heard from only one point on the inside of the mine, and that that point was the one nearest the area as located on the surface.



J. B. TYRRELL,
Recently elected member of council of the Institute of Mining and Metallurgy.

Ore Receipts at Trail.

Ore receipts at the Trail Smeltery for the week ending March 14th totalled 7,546 tons, which is 2,000 tons greater than were the receipts for the week previous. The shipping mines over the period referred to numbered eleven and there are indications that activity is increasing in the mining sections which may be termed tributary to the Consolidated Mining & Smelting Co.'s great plant. Ore shipments to Trail since the beginning of the year by Districts follow:

Special Correspondence

NORTHERN ONTARIO.

Will Develop Claims in Gillies Limit.

A company to be known as the Oxford-Cobalt Silmer Mines, Limited, is being organized for the purpose of developing two claims in the Gillies Limit, a few miles south of Cobalt. The Nos. of the claims on which work is to be undertaken are: A-100 and C-1000. The organization of the company is in charge of Mr. J. W. Russell, of Woodstock, Ont., who formerly was connected with the Kerry Company in the development of the Cart Lake Lease. While up to the present time no mines have been developed in the Gillies Limit, favorable formation has been discovered in two sections of the area, and has attracted attention since Cobalt's earliest days. One is the conglomerate area in the most northerly section of the territory, where some rich ore was found in veins in the conglomerate at surface. Values did not prove consistent. The other favorable area is a little farther south, where Keewatin occurs along the diabase sill, on the upper side. It is in this latter area that the property of the Oxford-Cobalt is situated. A number of promising veins are said to occur on the claims, in which cobalt and low silver values have been found.

A Mill for Adanac?

In view of the satisfactory results obtaining at the property of the Adanac Mining Company, Cobalt, the management have under consideration the construction of a milling plant with a capacity of about seventy-five tons per day. It had been formerly intimated that the Adanac might secure the mill of the Temiskaming Mining Company, the adjoining property. The construction of a new mill would eliminate the transporting of the ore to the adjoining property, and make available a larger amount of ore of a lower grade on the Adanac than would be possible providing it had to be transported to the Temiskaming Mill. According to official advice underground operations at the Adanac are said to be favorable. The winze is now down more than twenty feet, at which point good grade ore continues. A considerable amount of high-grade ore has been bagged and a large tonnage of low-grade has been conveyed to the surface dumps. It is stated that the ore after hand sorting, carries an average silver content of about thirty-three ounces to the ton. A number of veins are being worked on, and generally speaking, the results at the property are quite satisfactory.

A Busy Year for Prospectors.

Judging by the large number of mining claims on which assessment work must be performed this season, a busy time is ahead of the prospectors and mining men of the north country during the coming spring and summer. A number of new districts have been extensively staked during the past two years. Owing to the scarcity of men to perform assessment work during the war, many claim-owners have received extensions of time on the performance of their legal duties, with the result that in a great many cases more than the current year's work will require to be done. It is conservatively estimated that between two and three thousand claims are being held in the Temiskaming district upon which it will be necessary to perform the required assessment work this summer, or forfeiture to the Crown will follow. On the average of these claims sixty days' work is required. Providing just 2,000 claims are so situated 120,000 days' work will be required to be performed during the next six months. To accomplish such an amount of work would require about eight hundred men working twenty-six days per month during the six open months of the season. Thus it is expected the coming summer will prove a busy one in the prospecting field and its allied pursuits.

Gold Discovery in Hurricanaw Area.

Reports from the Hurricanaw River district are to the effect that a promising discovery of gold has been made on the Cisco property. This property is situated about one and a half miles from the Martin Gold Mines, the leading operations of the district, and is under option to Montreal interest, who anticipate early exploration.

Burton-Munro.

Work is being conducted on a small scale on the property of the Burton-Munro Gold Mines Company. A test pit is being sunk on the vein, and is now down about twenty feet. The property is situated in the township of Munro, a short distance from the famous Croesus Mine.

Alexo Shipments.

Shipments from the Alexo Mine at Porquois Junction for the third week in March amounted to four cars containing approximately 393,000 pounds of nickel ore. During the preceding week three cars containing 408,000 pounds were shipped from the property. The total amount of ore shipped during the first three weeks of March amounted to 1,111,000 pounds. The ore is taken to Sudbury for treatment.

Elliott-Kirkland.

Work is being held in abeyance at the Elliott-Kirkland property for a short time, while plans for a further programme of exploration and development are being mapped out. This property adjoins the Kirkland Lake Gold and the shaft has been sunk to a depth of 500-feet. Considerable diamond drilling has also been carried out on the property.

Will Develop Properties in Gowganda Area.

According to reports from Gowganda, preparations are being made to do considerable development work on a number of properties which have been in idleness for some time. Among those mentioned as likely to resume operations right away is the Reeves-Dobie. A small steam plant is being taken in to the Collins group of claims situated about six miles east from the Miller Lake-O'Brien Mine. The Hudson Mining Company of Cobalt is reported to be making arrangements for the re-opening of their property here in the near future. The annual meeting of the Silverado Mining Company was held at Cobalt this week. A small gang of men are working at the property, and will be added to with the advent of warmer weather. The next few months promise extensive enlargement of the active mining operations in the Gowganda camp.

Three Mills in Operation at Kirkland Lake.

Three mills are now in operation in the Kirkland Lake camp, and generally speaking the Kirkland Lake field is taking on a very business-like appearance. The milling plants now operating include the Lake Shore, Teck-Hughes and Kirkland Lake Gold Mines. Within the next two months it is expected the Tough-Oakes will have its mill in operation, and by mid-summer all four mines should be producing at full capacity. The installation of the 150-ton milling plant on the Wright-Hargraves should also be in an advanced stage by the end of August, while it is only a matter of time until installation of a mill will become necessary on the Kirkland-Porphyry, which will make a chain of more than two miles of producing mines.

The Dome Re-opening.

Mining interests both large and small are looking to the re-opening of the Dome Mines at Porcupine, with expectations perhaps never before exceeded in the history of the mine. In view of the fact that the Dome is recognized as a large low grade mine, it is obvious that in treating a large volume of ore daily, lies the only means of realizing the full benefits of operation. With the large amount of ore broken in the shrinkage stopes of the mine ready for hoisting to the mill it seems highly probable the plant will soon be operating at full capacity. According to the last report of the company approximately 400,000 tons of ore of an average value of $5.10 per ton was already broken ready for hoisting to the mill for treatment. Since this time, further development has taken place and a large crusher has been installed at the 800-foot level, which should add greatly to the efficiency in handling the ore. Considerable diversity of opinion exists as to the policy of operation to be followed on recommencement of milling operations. In some quarters it is thought the mill will not be brought up to full capacity before late summer, while others are of the opinion that capacity production will be reached within a few weeks of re-opening, and some contend that previous production records may possibly be exceeding with the improvements inaugurated at the property during the period of suspended milling operations. Numbers of old employees who left the Dome when work was curtailed are being offered thei rold positions, and invariably they are requested to report for work by the 15th of the current month. The avowed policy of the president of the Dome to keep the shareholders advised as to important developments bodes well for the future. The mine stands out as one of the bright spots in the gold mining industry of this country, and present indications are that upwards of five hundred men will be working at the property within the next few months.

Dome Lake Mill Again in Operation.

The mill at the Dome Lake Mines, Porcupine, resumed operations again this week, according to advice just to hand. It is expected the average tonnage treated in the mill will show an increase from this date forward, and will possibly exceed the average accomplished before the closing of the mill some time ago. Underground developments at the property recently are said to have been of a very satisfactory nature.

Interest in Larder Lake Area.

Several of the mining companies of the Cobalt district are interesting themselves in the Larder Lake Gold Area. This is apparent in the fact that a large number of claims have been staked by representatives of these companies recently. The possibilities of this district have always been conceded to be worthy of further investigation, it being realized that initial exploration and developments in the area were of a very superficial character, insufficient work being accomplished to prove the merits of the various properties. The Goldfields Consolidated Mining Company's operations are the most important in the district to date, and it is reported encouraging results are being met with in development there.

Will Drill at Haileybury.

Much interest is being manifested in the operations of a diamond drilling machine which has been set up just west of the Temiskaming and Northern Ontario Railway tracks at Haileybury, where it is proposed to drill for oil.

Arnold-Hughes Claims Sold.

Another big deal was closed this week for property in the Boston Creek gold area, when a group of three claims owned by Dr. Arnold and J. A. Hughes, both of Haileybury, changed hands. The claims are situated in Catherine township, and adjoin the Cotter property on the latter, of which the eastward extension of the rich Miller-Independence vein has been discovered. The purchaser, Mr. Savage, of Buffalo, will make substantial payments at intervals of ninety days. A payment was made on the signing of the option agreement, which is to go towards immediate exploration and development work. A company is to be formed for the purpose of completing the payments and carrying on development work. This deal forges another link in the chain of properties which are gradually being acquired by strong interests in the vicinity of the Miller-Independence. The northeast corner of Pacaud, together with the northwest corner of the township of Catherine and McElroy, and the southeast corner of Boston township comprise the chief area of present activity in the new mining field.

Indications point to the possibility of activity spreading far into Catherine as well as northward into the ownships of Boston and McElroy. These four townships are the area commonly known as the Boston Creek field.

Washington Smelter Closed Down.

The closing down of the Northport, Wn., smelter is a matter of considerable interest to the mine operators of the Boundary District of British Columbia. There is a belief among some Canadian mining men that this action is the result of an understanding with the large smelting interests of America. One newspaper of the Provincial Interior observes: "The West Kootenay Light & Power Company recently completed an expensive line from Trail to the smelter at Northport in order to sell power to the plant, but it is likely that the big Canadian power concern took good care to protect itself against any such contingency as that at present existing."

BRITISH COLUMBIA.

Will Resume Operations at Anyox Smelter.

Preparations are being made by the management of the Granby Mining & Smelting Co.'s plant at Anyox, B.C., for the resumption of operations. The smelter, it will be recalled, closed down several weeks ago when fire destroyed a small part of the equipment. The men also had refused to accept the company's proposal for a reduction of wages, the same to be placed on a sliding scale which would advance or decline with the fluctuations of the price of copper. The plant now is ready for work again but, in the meantime, the majority of the workmen have left the town to look for employment elsewhere. The management, therefore, is looking for men in Vancouver, Victoria, and other provincial cities, it being advertised that 1,200 are required and the preference will be given to returned soldiers. It is not thought that there will be much difficulty in securing the number of workmen needed, and the expectation is that work will be resumed very shortly.

Testing Laboratories for British Columbia.

The announcement that the Dominion Government is making provision in this year's estimates for the expenditure of $100,000 on one or more ore testing laboratories in this Province is welcomed by mining men. This is something for which British Columbia operators have been agitating for years. At present it is necessary to send ore which it is desired to have tested to Ottawa, thus involving expense and considerable loss of time. With facilities at hand those engaged in putting properties, especially of the complex ore bearing character, on a shipping and paying basis will find readily available the means of obtaining necessary information.

Renewed Activity in Yukon Gold Mining.

Klondyke operators are preparing for extensive dredging and hydraulic work this year, according to reports from Dawson. It will commence about May 1. It is thought likely that the output of $2,000,000 in gold will be considerably exceeded this season, as some of the larger companies, which have been tied up by litigation and the work of re-organization, are planning to resume operations. It is estimated that fifty creeks of proved value remain in the Dawson district. The Canadian Klondyke Company's dredge No. 4 worked every day last winter and is going full blast still, which is considered a remarkable feat under semi-Arctic conditions. The Mayo Silver Camp is said to be proving up very satisfactorily and those from that section optimistically declare that it is destined to rival Cobalt.

A Placer Gold Discovery Above Marshall City.

E. W. Parks, owner of a quick-silver mine in the Yukon, arrived from the north a few days ago, and reported that a placer strike had been made above Marshall City, and a short distance beyond Holy Cross on the Yukon River. Mr. Parks states that he met a number of prospectors who have stampeded to the new diggings and that they report 50 cent pans as common there. The creek on which these placer claims are situated, and which ground is said already to be completely staked, runs into a slough of the Yukon River.

Will Drill Aspen Grove Properties.

Four standard diamond drill outfits have arrived at Thelia on the Kettle River Valley Railroad, Kamloops District, and will be taken to the property of the Aspen Grove Amalgamated Mines, Ltd., for exploration purposes. Mr. Joseph Errington and associates are representing the bond holders, and active extensive work is promised for the coming season. The property comprises some seventy-five claims on which considerable development work has been done. It is said that should the drilling results prove satisfactory the capital necessary for the further opening up of the property, to the end that it be placed on a producing basis, will be immediately available.

Nechaco River Mines, Inc.

Promising reports have been received from mine properties situated on Stone Creek about twenty miles south of Prince George, B.C., where the Nechaco River Mines, Inc., a New York Syndicate, has been carrying on development work for the last two years, its property being known as the Yellowjacket Group. From the quart zformation near the main lead an assay has been obtained showing values of $27 a ton in gold, silver and lead. The statement is made of this property that there are thousands of tons of the same formation on either side of the main and richer body of ore which could be loaded on cars by a steam shovel. The Yellowjacket Group lies about four miles east of the Pacific Great Eastern Railway grade and adjoins Stone Creek Canyon. William West is in charge of development work at present, but expects an engineer from New York to look over the ground and decide upon a plan of operations at an early date.

Examining Property of Kitselas Mountain Mining Co.

The Kitselas Mountain Mining Co., which has a gold property situated near the town of Usk on the Grand Trunk Pacific Railway, is negotiating for its sale to a syndicate of North Dakota capitalists.. Representatives of the latter recently made an inspection of the prospect, took samples, and the character of their report will determine the results of the negotiations.

An Opportunity for Placer Miners.

W. A. Phair, a pioneer placer miner of British Columbia, at present resident at Lillooet, offers a striking solution of the question of employment for returned soldiers during the reconstruction period. "During this period of depression," he says, "it seems to me that some of those in the city who cannot find employment for the moment could, at least, make a living by placer mining along the Fraser River. During the depression, about 1896, I can remember seeing the banks of the Fraser lined with Chinese and Indians with rockers and pans. They used to make at least a dollar a day with a chance of striking a pocket. They used to work several months each year. During the low water periods of March and April there are great chances to get down where the river has not been worked and when a pocket is struck it generally means several thousands of dollars. A few years ago Indians took out a lot of gold just above the town of Lillooet. I know several averaged over $30 a day for some weeks. If several prospectors got together they could wing dam parts of the river with the chance of big money. Then there are several new gold-saving devices which might be used to advantage."

Canada Copper.

The Napoleon Mine in the State of Washington has been dismantled by the Canada Copper Corporation. A 5,000-foot tramway of the Bleichert aerial type, has been moved to the Mountain Chief Mine at Ranea, where it will be installed for early use.

Echo Silver-Lead Mine is Now a Steady Producer.

The Echo Silver-Lead Mining Company, which operates near Silverton, B.C., has entered the list of continuous producers. Four carloads of silver-lead concentrate are produced monthly. The silver-lead concentrate contains 65 per cent lead and 125 ounces of

silver to the ton, and the zinc concentrate 40 to 45 per cent zinc and 60 ounces of silver to the ton. The zinc concentrate is being banked at the mill for lack of satisfactory market for zinc products. The Echo mine is equipped with a two-bucket tramway that is connected with the Standard tramway by which ore deliveries are made to the Standard Mill, where the concentrating is done.

Will Re-open Highland Valley Mine.

F. Keffer, manager of the Highland Valley Mining and Development Company, states that this property, which is situated in the Ashcroft District of the Province, will be re-opened and probably placed on a producing basis this summer. The mine is well equipped, possessing a concentrating mill. The necessary capital having been interested, Mr. Keffer looks forward to a season of activity and who states that "we expect to begin work as soon as the snow goes, and push it for all it is worth."

The Smelter Rates Investigation.

The committee of investigation into charges made by the Slocan lead-silver-zinc shippers against the management of the Trail Smeltery in respect of the latter's custom smelting rates is reported to be making good progress in its work. A number of meetings have been held and evidence taken from those directly affected on both sides. Information also has been secured from officials of the smeltery. The preparation of the report is the chief task now before the Committee, and in this it is stated that the assistance of Mr. E. R. Whittaker, who conducted the Colorado State Investigation, will be available. It is not expected that the report will be ready before the lapse of two or perhaps three months.

Killed by Snowslide.

Two men of the Surprise mine force, who were employed on trail work, lost their lives recently when a snowslide caught and swept them into oblivion. They were William McKnight, a Scotchman, and Joe Sesil Sonr, an Austrian. Both were about 35 years of age and married. The scene of the fatality was near the Noble Five Mine, near Sandon, B.C.

Nugget Gold Mines, Ltd., Will Operate Sheep Creek Mines.

The Nugget-Motherlode-Searchlight Group of claims on Sheep Creek have been brought under control of a British Columbia syndicate which has been incorporated as the Nugget Gold Mines, Ltd. The property, it is stated, is to be actively developed and placed on a producing basis with as little loss of time as possible. Mr. R. H. Stewart, M.E., one of the best known of Provincial Mining Engineers, will supervise the work. In acquiring the Motherlode the new operators not only have a promising property, but have secured a ten-stamp mill of South African type, which was built by the Fraser and Chalmers Company of London in 1912. It includes a cyanide plant and is said to be one of the most complete mills of its size in the province. Those interested in the project look forward to developments with confidence. They state that it has long been evident that the only economical way to operate on Sheep Creek was to amalgamate several groups of claims and treat the ore at a central mill. This has been accomplished. The Nugget, Searchlight and Motherlode groups, with the mill on the latter property, found, it is said, an ideal mining and milling aggregate. The Nugget and Searchlight occupy the summit of the mountain, at an elevation of 5,500 to 6,000 feet above the sea level. The Motherlode mill is at the foot of the south slope of the mountain on the main fork of Sheep Creek, at an elevation of about 4,000 feet, so that there is a vertical depth of 2,000 feet of "backs" above the mill which can be worked by adits, enabling the property to be economically worked.

Portland Canal District.

The Portland Canal District, northwestern British Columbia, is going to be heard from this summer, according to a number of prospectors and operators from that section. No one, however, is more enthusiastic than R. W. Martin, of Seattle, Wn., one of the owners of the Mineral Hill Group of Claims situated above the Bush Mine, of which great things are expected this season. Mr. Martin looks for the completion of a wagon road to his and other adjacent properties in the course of the next fe wmonths and states that, with this done, considerable shipments of high grade ore will be made.

Expects Decrease in Coal Production.

"This year coal mines of the northwest will not operate 40 per cent of the time, which means a heavy expense for operators," stated James S. Ramage, head of the Continental Fuel Company, and the Hawkeye Fuel Company, recently in Spokane, Wn. "For some time," he continued, "there has been serious over-production of coal in Canadian and other districts from which Spokane City receives its supply, About 80 per cent of the steam coal used here comes from the Canadian mines, and a serious situation has developed in that country as is evident by a recent report issued by the Workmen's Compensation Commission, making the definite statement that cost of labor in producing coal is $2.60 a ton, which is above previous calculations and more than in other fields with which Canada competes."

The Coal Situation in Alberta.

As to the situation in western Canada in regard to coal production and trade it is interesting to note the comments of Premier Charles Stewart, of the Province of Alberta, made recently to the Legislative Assembly of that Province. He pointed to the stored up surplus of 2,000,000 tons of coal and admitted that the position was a serious one, especially with the embargo taken off American coal and with production costs at a high level. The Premier declared that the only solution of the problem was the reduction in the price of coal to the extent of at least $2 a ton in order that American competition might be met. This reduction, he said, had to be achieved by cutting the price of production, though some slight decrease might be attained in freight rates. He believed that the difficulty might be remedied at least in a degree by lengthening the time of production, assuring the miners of steady work for a period of eight months in the year, instead of but six months as at present. While Premier Stewart declared that he was against cutting wages, his remarks led to the conclusion that, with the lengthening of the period, the miners' daily wage would have to come down. He virtually admitted, however, that the Alberta Government was helpless in face of present conditions.

Work has been resumed at the Diamond Vale Coal Mine, Merritt, B.C.

Coal Prices at Prince Rupert.

During the past winter the City of Prince Rupert has been complaining bitterly of the cost of coal to its citizens. The question has been discussed by the councillors of the community regularly without achieving much in the way of results. At any rate, it has been found impossible as yet to obtain such reductions in the price of coal at Vancouver Island mines, together with handling charges, to bring the ultimate cost to the consumer below the figure at which the fuel stood, per ton, at

the outset. Several weeks ago, however, Prince Rupert had her chance. The Fuel Control Board of the City Council recommended the purchase of 1,800 tons of coal from the Coastwise Barge & Steamship Company, at Vancouver, B.C., the same to be delivered alongside the dock at Rupert at a cost of $7.00 a ton. Theer can be no doubt that, making the most liberal allowance for handling charges from the barge at the dock to the cellars of the consumers, the latter would have been able to get the fuel considerably cheaper than the $12 a ton, and more, which they have been paying. But the City Council, when confronted with the straight proposition, declined the responsibility. The tying up of $15,000 of the city's money, even for a brief period, did not commend itself to the civic solons and the Committee's recommendation was vetoed. It would seem that, after all, the directors of Prince Rupert's destinies have come to the conclusion that there is a proper and useful niche in the life of the municipality for the coal dealer who, on the Pacific Coast of late, has been receiving some pretty hard knocks.

Litigation Over Coal Lands by Nanoose Collieries.

There has been litigation during the past few weeks over title to the coal fields of Vancouver Island controlled by the Nanoose Collieries, Ltd., suit being brought against the Company by A. F. Eastman, manager of the Marble Bay Mines, Texada Island, for an accounting and for an order restraining further work on the property. His claim was that in 1906 he had entered into an agreement with the then owner of a portion of the property now under development to provide money for opening up the coal measures supposed to be there in return for a half interest. Work started on this basis, a small seam was struck not far from the surface, and then a disagreement arose with the result that operations were suspended. Mr. Jack subsequently died. His executors, according to Mr. Eastman, declared that the estate would sell its interest for $60,000, whereupon Mr. Eastman et al arranged to dispose of the entire holdings to Alvo von Alvensleben, the German financier and propagandist of which considerable has been heard both in Canada and the United States of late years, for $125,000. This, however, was not accepted by the Executors and Alvensleben bought the Jingle Pot Mine, near Nanaimo, B.C. Finally the property was sold out to the Nanoose Collieries, Ltd. The reply to Mr. Eastman on behalf of the company was that his agreement with Mr. Jack was to the effect that he should have one half of the returns of coal produced during the active operation of the partnership. The Court upheld the Company and the action was dismissed.

British Columbia to Recompense Sufferers from Riots.

An echo of the Vancouver Island coal miners' strike of 1914 was heard in the British Columbia Legislature during the closing days of the last session when Premier Oliver moved that members of the House should go into Committee of the Whole to consider the advisability of settling the claims of those who suffered through damage to or loss of property because of the riots which occurred on that occasion and, if favorable thereto, that leave be granted to introduce legislation to that end. The resolution was carried; the discussion developed that the opinion was unanimous that the Province was obligated to make proper recompense to the sufferers; and the necessary Bill was introduced and passed without loss of time. Mr. Justice Gregory, of the Supreme Court, it should be explained had been appointed a Commissioner by the late Government in 1916 to hear evidence and decide on the amount due to each of the petitioners and his report, which was presented and on which payment will be based, indicates that the total sum to be thus disbursed is $56,878.

Premier Oliver, in moving the resolution, explained that personally he did not think the Province was legally responsible for the payment but he thought there must have been some object in having an inquiry made and that the then Government, in ordering one, contemplated payment of claims approved by the Commissioner. He felt that it was a matter for the Legislature to decide and that was why, as Leader of the Government, he had brought the matter to the House in order that it might give expression to its views.

There was considerable debate. One member suggested that, inasmuch as the Dominion Government had recognized its responsibility by the calling out of the Militia in order to quell the disturbance, it seemed that that Government might be held responsible for the damage to property. For the Province to pay would be the establishment of a bad precedent. W. J. Bowser, the Premier at the time, declared that, whatever might be the legal responsibility of the Province, he certainly thought there was a moral one, while J. H. Hawthornthwaite, member from one of the coal mining sections, stated that he had "butted" into the troubles in the effort to efect settlement, but the miners had been badly advised and the riots resulted. The Province had control over civil rights and property and must protect them. He was convinced that the Government should shoulder the responsibility for the payments.

Hon. Wm. Sloan, Minister of Mines, believed the responsibility for the trouble lay with some 200 agitators who came over from the State of Washington and inflamed the miners. Application had been made to the then Government for protection, but it was not forthcoming until after the damage had been done.

As a result of the passage of the measure the claimants will be paid forthwith.

Nicola Valley Coal.

For a number of weeks the Merritt (B.C.) Board of Trade has been investigating the coal situation as it affects the Nicola Valley Coal field with a view to the presentation of arguments to officials of the Canadian Northern Ry. Company to the end that the latter concern may be persuaded to use Nicola Coal in the operation of the inter-mountain divisions of their railroad. At the present time the fuel used comes from Brule Lake, Alberta, and Vancouver Island. President Hanna, of the C.N.P.R., is visiting the Coast and advantage is being taken of the opportunity to have a deputation of the residents and coal operators of the Nicola-Princeton District wait upon him with respect to the matter.

Amendments to B.C. Coal Mining Regulations.

The amendments to the Coal Mines Regulation Act, introduced to the Provincial Legislature at the session just closed by Hon. Wm. Sloan, Minister of Mines, passed with no very material change. One alteration, however, was permitted, namely, that the Minimum Wage Section, which authorized the Minister of Mines to define any particular coal mining section and to declare it a minimum wage district, shall not come into effect until July 1920. Thus the coal mine operators are given a year before this law can be applied. As it is thought that this legislation is aimed at the Chinamen employed as miners at the face in some of the mines of the Province, it is possible that the condition which gives, allegedly, rise to this part of the Act will be non-existent before the lapse of twelve months. It fol-

lows that there is a possibility that the Legislature may decide ultimately that it is unnecessary and may be expunged. However these are but surmises and the probability is that, with the consensus of opinion being in favor of a minimum wage under any condition, that the measure will remain on the Statutes and be applied when found advisable.

It is significant, in this connection, that notices have been posted by the Canadian Western Fuel Company at its mines in the Nanaimo District informing employees that from the 1st of April the price of coal to them will be $4 a ton. They have been getting it for $2.50 a ton. This advance was necessary, the announcement stated, owing to the decision of the company to make Nanaimo a white man's camp by replacing Orientals now in the company's employ by white men who, owing to advanced age or injuries, were unable to continue their regular employment underground.

The Tax on Coal.

At one time during the recent session of the British Columbia Legislature the coal mine operators of the Province were disturbed by the report that it was the Government's intention to increase the per ton tax on coal produced from 10 cents to 25 cents. Representations of a very strong character were made against any such impost, it being contended that it would make the costs so high as to render it impossible for British Columbia coal to hold its foreign markets, chiefly those of the States of Washington and Oregon. The Legislature has prorogued and the minds of the operators are relieved as, while an amendment has been made to the Taxation Act affecting them, nothing so radical as was suggested has been placed on the Statute Books. The tax for years has been 10 cents per long ton on all coal shipped, exported, or delivered from the mines of this Province, excepting that which goes to the coke ovens. To take care of the latter there is a supplementary clause taxing coke at the rate of 10 cents a long ton. The amendment referred to makes the coal mines or collieries liable to pay either the 10 cent Royalty described or to pay on their income, the Crown having authority to collect on whichever basis yields it the greater revenue.

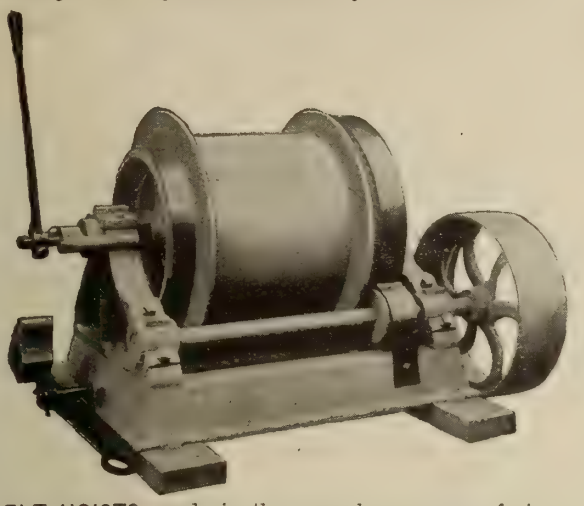
MINE HOISTS

Steam, Electric or Belt

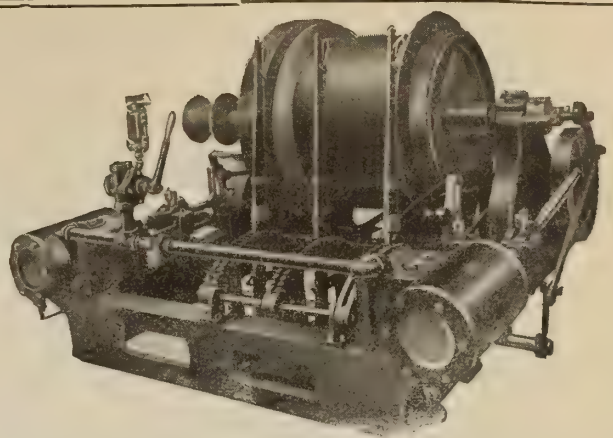
Any size you want up to 50 H. P.



BELT HOISTS, made in the same large range of sizes as the Steam and Electric Hoists.

All our Hoists are properly built to withstand hard usage. They are simple in construction, do not easily get out of order, and the repair bill is exceedingly small.

Send for Catalogue.



STEAM HOISTS, Reversing or Non-Reversing, 2 Types—Drums Friction Driven, or keyed to shaft. Operating Levers, Piping, etc., arranged to suit the buyer.

ELECTRIC HOISTS, made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears, and extended base ready to receive the motor.

MARSH ENGINEERING WORKS, LIMITED, Established 1846 **BELLEVILLE, ONTARIO, Canada**

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Mine Winding Engine for Immediate Disposal

Specifications:—

Double Drum, double Cylinder, direct drive high-speed Winding Engine, Cylinders 14 x 42. Reverse Link Motion. Pistons 21¼" diam. Cross head shoes adjustable to take up wear between the slides. Running in V shape slides; Length of Engine Bed Castings (suspended) from rear cylinder cover in centre drum shaft, 16′; Solid Crank Wheels 4′ diam., 3½" Rim, keyed on to Drum Shaft 6½" diam. Hollow Drums, 3′6" diam. x 4′ Winding Space, Flanges 3′. Each Drum fitted with adjustable Expansion Clutch operating inside outer rims. Each Drum fitted with Band Brake—operated by Independent Levers. Overhead Throttle with Drop Lever and Lubricator.

Lever Bank:—1, Engine Reverse Lever; 2, Brake Band Levers; 2, Clutch. Long Powerful Levers operating on floor stand quadrants.

Kirkland-Porphyry.

Development work on the Kirkland-Porphyry property at Kirkland Lake to a depth of 400-feet has opened up a large tonnage of high-grade ore. Visible gold occurs quite freely, and the mineralization is said to be very consistent. A crosscut is being driven south at this level for the purpose of encountering the westward continuation of the No. 1 vein, or the south orebody of the Lake Shore Mine. If success is met with in this development and commercial ore be found to occur in the vein, it would prove of extreme importance to the Kirkland-Porphyry. It might also prove of considerable importance to the Kirkland Lake Gold property which adjoins.

La Rose Developing Princess Property.

Quite satisfactory results are said to be attending development work on the old Princess property adjoining the McKinley-Darragh Mine, and being operated by the La Rose Mining Company, Limited. According to reports the new vein opened up early in the current year on the McKinley-Darragh, and which was found to be running in the general direction of the Princess, was found to have terminnated before the boundary was reached. A considerable amount of rich ore came from the Princess in the early days of the camp, and with the present high price of silver as a stimulant to encourage exploration the La Rose mining company is carrying out a development program, which is being rewarded with a fair amount of success. Reports in well informed circles here are to the effect that a vein was recently uncovered at the 200-foot level of the old La Rose property, from which a considerable amount of high grade ore is being obtained, while the wall rock on both sides of the vein is said to carry milling ore for several feet. The high grade streak is said to be about six inches in width. Work is still being energetically prosecuted at the Violet property of the La Rose mining company, and satisfactory results are said to be attending with further opening up of the valuable orebodies. A large amount of good grade milling ore has been opened up, and the orebody has been proven to persist to a depth of 475 feet in a winze which was sunk to this depth from the 410 foot level. While official announcement of the date set for the hearing of the dispute between the O'Brien and the La Rose, concerning the boundary line of the two properties, has not been given out, persistent rumors are current in the camp that the case is to come up about the fifteenth of the month. While much importance is attached to the outcome for both companies concerned, the decision is not vital to the future of either company.

WILDCATS SHOULD BE MUZZLED.

Contrary to outward appearances, and despite the silence of public comment, conservative mining interests are not altogether pleased with the outcome of recent attempt of the Ontario Government to devise ways and means of combating the prostitution of the mining industry of this province by a few modern pirates Obviously, according to unanimous opinion throughout the mining districts, the "Sale of Shares Act, 1919," was most decidedly not the remedy, having the affect, as it probably would have had, of interfering with the earnest efforts of all mine operators no matter how sincere. However, in spite of this one failure to find the proper solution, the opinion is being quietly expressed among mining men that the matter should not be permitted to drop, and that the opposition raised in Northern Ontario should not be misinterpreted as signifying opposition to the principle of the measure.

When, early in the present year it became known that legislation was being considered, aiming at the protection of the public, the captains of industry as well as all the decent thinking people of the whole of Northern Ontario believed the Government had at last decided to no longer disregard the flagrant abuse of one of the basic industries of the country. Heads which had been bowed almost in shame at the Governments previous inaction in this respect raised their eyes to greet this flicker of hope. Then came the full text of the bill, which was followed by one of the greatest waves of resentment of its kind ever experienced in the North. The bill would confer power upon a commissioner to judge whether or not any particular proposition promised a "fair return on shares to be offered for sale," a power which no man has yet been able to develop and which is the fundamental fact in placing unusual value upon the precious metals.

The contention has been put forward that laws already in the statutes are adequate to protect the public, but that these laws have been frequently disregarded by wildcat promoters, and the powers with which the authorities have been possessed have not been exercised, and that the abuse of the mining industry has been due partly to the unscrupulous promoter and partly to the failure of the authorities to fulfil its obligations to the public.

The suggestion has been offered that mining promotions should be placed under the jurisdiction of the Bureau of Mines. The suggestion appears to have been met with a good deal of favor. Through the Minister of Mines, the Mining Commissioner, the various mining recorders in all parts of the province, the staff of geologists, and through constant touch with sincere mining men it would not be difficult to arrange the necessary machinery to successfully cope with wildcat promotions. After all a so-called wildcat (except in oil drilling parlence) is but a piece of territory upon which there may or may not be possibilities of success, but which is promoted in such a manner as to permit its promoters to pocket a large portion of the money subscribed by shareholders, and leave only a portion to go toward development work as a means of covering their tracks.

For any one individual to attempt to find a remedy, would appear to be very unreasonable, very unfair to the industry and an injury to the country as a whole. There should first be a report expressive of expert opinion from all angles and compiled by some such an organization as the Bureau of Mines.

In a word, legitimate operators do not wish to be placed at the mercy of any politically appointed commission, or, as a matter of fact, at the mercy of any commission. At the same time, genuine operators express the sincere wish that misrepresentation should be made punishable by law. By this route lies at once, protection for genuine effort and punishment for the wildcatters.—J. A. McR.

TUBE MILL LININGS.

A new tube mill lining has been brought to our attention, which promises to remove a great deal of trouble and annoyance from the operation of this mill. Up to the first year of the war the Silex lining had been almost universally employed and when properly installed this lining gave fair satisfaction. The war, however, shut off the supply of Silex and there does not appear to be any prospect of this material being available for some years yet, and recourse has been had to chilled iron lining plates, but these are far from satisfactory.

The problem was attacked by Mr. F. B. Kilbourn, of Montreal, and he evolved an entirely new idea in linings, which he has successfully patented. This lining consists of a series of special chilled iron T-bars set on edge round the tube mill and spaced from ¾" to 1" apart. The spaces between the bars are filled with a rich cement grout and when this is set the tube mill is ready for operation. After a few hours running the concrete between the bars is worn out somewhat, leaving the bars protruding. The appearance of the mill can be seen from the illustration which shows the corrugated affect of the bars protruding beyond the concrete filling; this corrugation has the effect of positively driving the contents of the mill. Users of tube mills are quite aware of the fact that with the Silver or chilled iron plate lining there is a great deal of slipping of the contents, which not only wastes power, but reduces the efficiency of grinding very greatly.

We understand that many tube mills have now been equipped with this new lining and the results attending their use exceeded expectations. The first mill so equipped was shut down after 5,000 hours of operation and the wear checked up. A careful record has been kept of the original internal diameter and measurements after the mill was taken out of commission showed a wear of only ⅛". The illustration shows this particular mill after having run for 5,000 hours. As the wearing depth is two inches the life of this lining would be 80,000 hours, or over nine years con-

tinuous operation. The small amount of wear shows that there can be very little slipping of the contents and that the claim of positive drive is fully justified.

Another feature that should be noticed is the uniformity of the wear. As is well known a chilled iron plate wears in grooves and holes and a plate has to be discarded on that account and not on account of uniform reduction in thickness. Another feature is that no bolts are required and the trouble and annoyance from this cause are removed.

We understand that Messrs. Burnett & Crampton, at Rigaud, Quebec, have been appointed sole manufacturers and selling agents for Canada for this lining. This is a comparatively young concern and they appear to be in the field to turn out the highest grade of castings. They inform us that they have had considerable success with chilled iron and also with high grade machinery castings. Both partners in this firm are engineers and, therefore, appreciate an engineer's requirements in grey iron.

GOVERNMENT EXPLORATION FOR MINERALS.

The secretary of the Canadian Mining Institute, Mr. H. Mortimer-Lamb, has recommended that an endeavor be made to interest Federal and Provincial authorities in his scheme for governmental exploration for minerals. It is to be hoped that some way will be found to speed up prospecting and Mr. Lamb's scheme has the advantage at this time of affording employment to returned men.

Under this scheme, officers of the Department of Mines would be in charge of prospecting areas. The prospecting parties would be under the leadership of mining engineers. The men would be paid by the Government. Discoveries would be examined by officers of the Department of Mines and there disposed of to operating companies. Of the monies realized from the sale of properties 75 per cent. would be retained by the Government, and the remaining 25 per cent. would be divided among the members of the party responsible for making the original discovery.

In our opinion some such scheme should be given a fair trial. There are obvious difficulties to be encountered, and unexpected ones will doubtless crop up; but one important discovery would possibly make the experiment quite worth while.

To assist technical, professional and business men returning from overseas to secure suitable employment a special section has been established by Department of Soldiers' Civil Re-establishment. Major George C. Riley, of Montreal, a member of the Canadian Mining Institute, will be in charge of the work. Major Riley will doubtless be pleased to hear from any operator who needs technical men.

The decision to engage an assistant secretary is another sign that the Canadian Mining Institute is growing and that it intends to do something this year. One of the advantages will be that the secretary will be able to visit branches more frequently without causing accumulation of work at headquarters.

H. W. Appleton, formerly with Robert W. Hunt & Company, and recently Works Manager, Toronto Plate Glass Importing Co., has joined the staff of Burns & Roberts, Ltd., railway and contractors' equipment, Toronto.

THE FREEHOLD SYSTEM.

To the Editor of the Canadian Mining Journal:

Sir,—In connection with the discussion regarding the holding of mineral areas by freehold as against leasehold, there is one phase of the subject that I do not think has been sufficiently emphasized, that is the opinion of those most directly interested: the prospector and the purchaser. A canvas of these interested parties would show that about 101 per cent are in favour of tenure by freehold. This opinion is easily understood. Ownership is necessary to any exchange. If all the prospector has to sell is ownership of a lease of a property, every day that he retains the ownership of this lease, lessens its value. The purchaser, on the other hand, feels that he is not purchasing the full possibilities of the property—he is only purchasing the right to make a profit out of the property for a limited time. This will lessen the valuation placed on prospects and lessen the expected profits from operation, tending to discourage both prospector and purchaser. Even a long-term lease with the promise of a renewal of lease will not overcome this, because ownership of a lease of a property can never be as valuable as actual ownership of the property, unless the lease be in perpetuity, when it is the same as freehold. Again, it must not be forgotten that many mining men do not consider that the promises of even Governments are inviolate.

The stock argument in favor of leasing is that the mineral resources of the country belong to all the people and should not be alienated; that the people should control their natural resources. This argument may be correct for agricultural lands, for timber lands, for water powers and for fisheries, for these natural resources, if intelligently handled and wisely conserved, will continue to produce food, timber, power and fish forever. But the mineral resources of a country cannot be used without becoming exhausted. A mineral will not reproduce itself, and the first pound of ore hoisted from a mine marks the beginning of the end.

The leasing system would be more wasteful and tend to more rapidly exhaust the mineral resources of a country than the tenure by freehold. If a company had only ten or twenty years in which to operate a mineral deposit they would make every effort to get all the profit possible in that time. The result would be that during the closing period of the lease, if it appeared that all the ore could not be extracted, the most profitable would be taken and no attempt would be made to keep the mine in repair. At the expiration of the lease the country would be the proud possessor of a hole in the ground, probably containing a greater or less amount of what was at one time payable ore, but which, under existing conditions, would cost far more to extract than the ore would be worth; nor could this be prevented except by having a reliable and capable Government mining engineer at every mine in the country with a staff of surveyors, samplers and assayers.

If the people wish to retain their mineral resources then let the Government take over the whole business of prospecting, developing and mining.

Further more, what is the necessity of the Government retaining ownership of mineral lands? It can, at any time considered necessary for the welfare of the state, commandeer the output, or take over the operation, or even stop the production of any mineral. It seems to me that the tenure of mineral lands by leasehold instead of freehold would tend to discourage the prospector and frighten away the investor, to rapidly exhaust the high-grade ores, and to encourage wasteful methods of ore extraction.—X. Y. Z.

Nova Scotia's Mines and Minerals Production, in Relation to the War

By HARRY PIERS, Provincial Museum, Halifax, N.S.

The Mines of Nova Scotia and the various local industries affiliated therewith, took their full share in contributing to the winning of the late war; and the record on the field of honor of the thousands of sturdy enlisted men from our colliery districts has been one to be truly proud of, and while many a fine Nova Scotian lad lies beneath the poppies in Flanders, others now stand triumphant along Rhine.

Despite very adverse conditions as regards labor supply, resultant from the heavy enlistment of skilled miners, and a great shortage of shipping and to some extent of rolling-stock; the mining industry put forth noble and united efforts to thoroughly do its bit as an auxiliary factor in the great world-struggle; the result may be viewed with pride by the people of the Atlantic provinces in general, and by the mining population in particular.

The chief mineral industry of Nova Scotia is at present that connected with the extraction annually of several millions of tons of bituminous coal of remarkably good quality, from its immense coalfields which cover a large part of the province, and which in costal regions extend for unknown distances under the sea. This vast industry claims our first attention.

Coal Production.

Of late years the production of bituminous coal in Nova Scotia has been regularly increasing from about 2,000,000 tons in 1890*, 2,089,245 in 1895, 3,238,245 in 1900, 5,050,420 in 1905, and 5,477,146 in 1910, until it finally reached the highest point in its history in 1913, when an output of 7,203,913 tons was attained, with the certain prospect of a still higher production under the normal peace conditions which were then existing, and which no one then thought would be so suddenly broken. The value of Nova Scotian coal was becoming yearly better known and more fully appreciated in more distant markets, every effort was being made to take full advantage of new openings for extending the trade, and to thereby increase the profits and the welfare of the province, and the whole prospect looked very bright indeed.

In the very midst of all this prosperity, war broke out in August, 1914, the whole country was suddenly put on a pre-arranged war footing, the voluntary enlistment of men for military service began, transportation problems became increasingly more difficult, and the result was soon seen in a slight drop to an output of 7,005,464 tons of coal for the year, and a still greater decrease to 6,379,463 tons in 1915. Great efforts were made to successfully cope with the adverse conditions which had thus arisen. Even with a great decrease in skilled workmen, the output, owing to an increased production per man, actually advanced in a gratifying manner to 6,496,472 tons in 1916, which was greater than the peace-time output of 1911.

*It is to be kept in mind that the fiscal year of the Nova Scotian Government ends on 30th September, and mineral returns conform thereto.

Coal was now being urgently needed for large munition factories which had sprung up in various places late in 1915, and noble efforts were made by the operators and the miners themselves, to keep up the source of power required by these war industries which worked for twenty-four hours every day in the year. The miners were being further reduced in numbers through enlistment, and new men had to be secured, often with much difficulty, by agents in the west, and these new hands had to be broken into colliery work, and rapidly turned into capable employees. In the year 1916, the output per man at the working-face, per year, reached the very high figure o fabout 590 tons—the highest on record in the province. This production per man will stand as an evidence of what can be accomplished under stress, and will no doubt furnish a datum point as to full efficiency in the future.

Still the number of employees continued to decrease, as large numbers patriotically passed to join the colors. Others came under the Military Service Act of 1917, and still others were attracted by the higher remuneration of the munition works where they felt they were also taking part in the war activities of the country. Transportation was becoming increasingly difficult both by sea and land, the former through the destruction of shipping and the latter through the inadequate amount of rolling-stock available to handle the vast amount of war supplies, food, and men which were pouring ceaselessly toward Europe. Despite those deterring factors, the output of coal in 1917 was 5,803,660 tons, and the production per man was about 560 tons.

In 1918, the year just closed, the total production was about 5,266,000 tons, which about equals that of the pre-war year 1909. It may be observed that the production of coal is in ratio to the number of men employed; and when workmen cannot be obtained for any reason, the output falls off and this holds good relatively no matter what degree of efficiency labor has attained to.

Coal in Cape Breton is probably worth about $6.00 a ton at the mine, and in Pictou County about $6.25 to $6.40; so that the output for 1918 had a value of about thirty-two and a quarter million dollars.

Men Employed, Output per Man, and Enlistment.

The war, as has been noted, had a very bad effect numerically upon the personnel of all the collieries. When hostilities broke out and voluntary recruits were called for, no class responded more readily and in greater numbers than the hardy coal miners, who were of muscular physique, and enured to fatigue and ever-present danger, and special Highland battalions were raised in Cape Breton Island, and others were largely recruited there and among other mining communities throughout the province, the most enlistments probably taking place in 1916. Large numbers joined the well-known 85th Nova Scotia Highlanders, the famous 25th Battalion, the 185th Cape Breton Highlanders, one of the Seige Batteries and some enlisted in the 64th Battalion, as well as in other corps.

The deeds of these noble men on the field of battle

show of what magnificent stuff these hardy and courageous Nova Scotian miners are composed. In one section of the Highland battalions—the 85th—over three-fourths came from Glace Bay, Inverness, Sydney Mines and the Dominion Collieries. The great fighting done by these and other berserks of the coal-pits, has been heralded by war correspondents and brought justifiable pride in the hearts of all. The same holds true of every battalion and battery in which the Nova Scotian miners are represented; they form a large proportion of the rank and file, and are among the very best of the nation's fighting men.

The mines had been pretty well stripped of able-bodied men under voluntary-enlistment system, and when the compulsory Military Service Act of 1917 came into force, a still further drain was made upon the mines. Agents of the coal companies had to sent afield in an effort to secure labor. As the production of coal is a very vital factor in prosecuting a successful war in modern times, particularly when munition works are dependant upon coal to turn their wheels, when maritime carriers and war vessels consume immense quantities of fuel, and the people of the country have to be kept warm in winter; the serious nature of this drain upon the personnel of a very essential industry was brought to the notice of the authorities, and it was felt that some remedy should be forthcoming.

The new munition works, as we have seen, were also offering large wages which attracted many men from the collieries to the workshops, and this was an extra menace to the coal industry, although the mechanics were still employed in urgent war-work. The opening of several small new collieries in various sections of the province, while it helped somewhat to lessen the acuteness of the transportation problem, by supplying near-by markets, lowered the available number of colliers for the older mines.

Some particulars will now be given of the number of men, above and below ground, employed at our collieries, and of the output per year per man at the working-face, as this data has, of course, a direct bearing upon the production. The reasons for the decrease in the personnel has been just referred to, and was a direct consequence of war conditions.

Men Employed in Nova Scotia Collieries.

In 1913, the year of our greatest coal production, 13,664 persons were employed above and below ground in the various Nova Scotian collieries, and the output per man "at the face" per annum was about 530 tons; the latter being the highest man's output hitherto, although the year 1902 nearly equalled it. The average output per man had been about 489 tons for the sixteen years since 1898, in which latter year the man output had suddenly gone markedly upward by about 123 tons from the average of 366 tons, which existed for the decade between 1888 and 1897. In one year, 1893, it had even dropped slightly below the 300-ton mark.

In 1914, the year of the war's outbreak, the number of persons employed had risen to 14,638; but the output per man dropped by 40 tons to about 490 tons. In 1915 the number of employees had further increased to 16,326 which was the largest number ever employed in the history of our coal mines, as the effects of enlistment were not then marked, and new men could be obtained to replace those who had joined the colours; but the output per man remained at about 490, as in the previous year, probably owing to the introduction of new men to take the place of skilled hands who had gone overseas.

In 1916, owing to increased enlistments in the military forces, etc., the number of employees suddenly dropped to 13,124, this being a decrease of no less than 3,202 men, which placed the working force back to where it was in the pre-war year, 1912. This was a very serious handicap to an essential industry which was striving hard to do its part in the economic phase of the war. The situation so created was, however, manfully met by increasing the efficiency of all the departments, and we are surprised and much gratified by seeing the output per man "at the face" per year suddenly leap upwards, by one hundred tons, to the splendid figure of about 590 tons which represents the very highest state of efficiency our colliers have ever attained to. This is a record to which our miners may very well point with pride. Thereby the total output of coal, even with a decrease of considerably over three thousand employees, was increased over that of the previous year by 117,009 tons. There were then about fourteen companies operating, which had been the average number during the preceding seevral years.

In 1917 the number of men employed still further decreased to 12,483 and the output per man was about 560 tons. Several new collieries, of small size and each employing about ten men, had opened this year, particularly in Cumberland County, and the number of operating companies had thus increased to twenty-one; so that the decreased total number of employees showed a still heavier decrease of labour at each of the older collieries. Some men left the old deep mines, preferring to work in the shallow new ones, where they would have shorter distances to go underground to their work, and where the conditions were considered safer. To counteract the shortage of labour, patent mechanical loaders were introduced that year into some of the collieries of the Dominion Coal Company, and this was found to affect a saving of about one man to a room.

It may be said to the credit of the workmen, that labor agitations were pretty generally put in the background during the war, and all united as far as possible in speeding-up the general output and efficiency.

Distribution of Coal.

During the war the St. Lawrence trade was necessarily discontinued. The following tabulation shows that the shipments to Quebec have been very small, as compared with normal years. The distribution of Nova Scotia coal by Provinces for the fiscal years ending 30th September, was as follows:

	1913.	1917.	1918. approx.
Nova Scotia	2,599,053	2,880,787	2,758,970
Quebec	2,193,228	303,012	134,440
New Brunswick. . . .	646,642	888,162	882,600
United States.	468,091	342,100	296,000
Bunkers.	234,177	382,973	285,360
Newfoundland	210,544	236,530	219,190
P. E. Island	96,082	103,168	78,070
Ste. Pierre	6,650	6,043	5,400
Other countries	2,830	299	. . . . .
Total	6,457,297	5,143,074	4,660,030

The springing into being of large thoroughly-equipped munition factories in Nova Scotia, working at top-notch pressure, day and night, and calling imperatively for power with which to drive their machinery, created a new and sudden demand upon the resources of our collieries which had to be promptly met. These collieries, besides producing a source of power for railway locomotion and various industries as heretofore, as

well as fuel for warming the people and for other household uses as in normal times, immediately came in with a direct contribution to the forces which were behind the guns. More coal, and still more coal, was required for smelting purposes and for the production of unusual quantities of steel, and finally for manufacturing this material into shells of all calibres and other warlike supplies which were rushed to the European front in large and continuous shipments.

We have some indication of this new, warlike use of our coal on glancing at the total coal consumption in Nova Scotia during recent years, having in mind that the average local consumption for a few years prior to the war was about 2,179,510 tons. The excess might at first sight be roughly put down as the amount used in the production of munitions, although actually the quantity used for the latter purpose was very considerably in excess of that, as the manufacture of structural steel, rails and ordinary commercial iron and steel was much cut down during the period of war, so that more of our coal was used in munition work than a direct comparison of the figures might otherwise suggest.

It is worthy of notice, that the high price of anthracite coal and the difficulty of obtaining it, caused many people in our towns to use bituminous coal in their heating furnaces; and once having tried this with success, without doubt many will continue the use of this fuel in the future, as being satisfactory and much less costly than anthracite.

Another direct contribution towards the war made by our coal mines, was the large amount of bunker coal disposed to many transports, munitions steamers, food-carrying vessels and ships of the navy. These vessels were bunkered at Louisbourg, Sydney and Halifax. The exact amount of such coal is not known, as much bunkering was done by private firms who had purchased from our collieries and it does not appear in our returns as separate from the local consumption.

The General Conditions at the Collieries for the various years may finally be thus set forth:—

In 1914 the working conditions at all the collieries were good; development work had been kept well in advance; power installations had been maintained at their usual high efficiency; and generally the collieries were developed and equipped for an output largely in excess of any that had hitherto been reached.

In 1915 the shortage of men and difficulty in obtaining sufficient means of water transportation, both caused by the war, had had the effect of decreasing seriously the output of coal; but the collieries in respect to equipment, working conditions, and development toward a much greater production, were in as satisfactory a condition as at the close of the previous year.

In 1916 although the shortage of men and the means for water transportation continued throughout the year, the output and sales were greater than in the preceding year, and it is to be particularly noted that the consumption of coal within the province increased by 710,869 tons as compared with that of 1915, this being largely due to the establishment of munition works and the consumption of coal therein.

In the next year, 1917, the lack of men and of adequate transportation were acutely felt. Compared with the previous year the output decreased by 692,811 tons and the sales by 790,636. This decrease in sales was about balanced by the reduced shipments to Quebec and the United States. The quantity of coal, however, sold in Nova Scotia was 2,880,787 tons, or a gratifying increase of 54,487 tons over the preceding year which itself had been a most noteworthy one in this respect.

In the year just closed, 1918, the operators were still confronted with the labor supply and transportation problems, and the total production fell, by about 537,660 tons, to approximately 5,266,000 tons, while in Nova Scotia the consumption decreased to about 2,758,970 tons, being a little more than half the entire output.

Iron and Steel Industry.

In the progress of the iron and steel industries of the province we observe further evidence of what was being done to help in the war-time activities of the country. As the war preceded, trade fell off considerably in the ordinary peace-time iron and steel products, owing to the temporary suspension of curtailment of much constructional work which was not very necessary; but the establishment late in 1915 and in 1916 of munition plants, operating at fever speed, day and night, called for coal, metallurgical coke, and limestone for flux, as well as the essential iron ore, pig-iron, and steel of special grades. We have seen how the local consumption of coal was strongly affected by this, particularly from 1916 onward. The following table shows clearly the effect of this, concurrently, upon the iron and steel industry of Nova Scotia, and how that province exerted itself to supply the demand for the local munition works, despite the hampering shortage of labor and transportation. The item of steel ingots shows the general trend. In 1913, the production was 483,600 tons, which decreased to 341,818 in 1914, but recovered to 369,310 in 1915 despite the decreased trade in ordinary commercial products, and a marked improvement is noticeable in 1916. Thence it mounted rapidly to 515,538 tons in 1917 under the stimulus of shell production, which is the high mark in the industry. A very large proportion of the iron and steel output after 1915 represents projectiles furnished the British guns to carry on the terrific daily bombardment at the front, and it was the ultimate preponderance of gun-fire which was such a very vital factor in the winning of the great war. The production of iron and steel in this province centres at the Dominion Iron and Steel Company's blast furnaces and steel works at Sydney, and those of the Nova Scotia Steel and Coal Company at Sydney Mines and Trenton.

The detail figures representing the iron and steel production are as follows, those for 1918 being approximate ones, as the exact amounts have not yet been made public:—

	Iron Ore, imported, Long Tons.	Pig Iron produced Short Tons.	Steel Ingots Short Tons.	Coke Short Tons.	Limestone, Short Tons.
1913	991,168	486,962	483,600	728,037	547,004
1914	562,103	281,428	341,818	467,730	335,515
1915	665,541	295,868	369,310	452,099	353,412
1916	795,066	429,615	502,106	669,478	514,474
1917	991,084	437,354	515,538	645,327	411,575
1918*	637,000	380,700	470,900	584,900	407,000

Munition Works.

The large, well-equipped shell factories to which reference has so often been made in this article, were first established here, under governmental inspection, early in summer of 1915, and were located at Trenton, Amherst, New Glasgow and Sydney, while others were at Dartmouth, Yarmouth, etc. By June, 1915, ninety per cent of the Nova Scotia Steel and Coal Co.'s open-

* Approximate.

hearth steel furnaces was being used in the production of shells. Among the important companies thus engaged in the production of such munitions, may be mentioned:—

The Nova Scotia Steel and Coal Company, Ltd., Trenton;

The International Engineering Works, Ltd., Amherst;

The Dominion Iron & Steel Works, Ltd., Sydney;

J. W. Cumming and Son, Ltd., New Glasgow;

The Starr Manufacturing Co., Ltd., Dartmouth;

The Burrill-Johnson Iron Co., Ltd., Yarmouth.

The supply of steel was obtained from the Dominion Iron and Steel Co., and the Nova Scotia Steel and Coal Co. Equipped with all necessary forging apparatus, presses, lathes, etc., and a large staff of men who soon became thoroughly proficient in the precision work requisite in this branch of mechanical engineering, the operating companies worked continually for twenty-four hours each day in the week, and produced vast quantities of shell-blanks, disks and other accessories, and assembled and finished them as forged-steel shrapnel and high-explosive (common lyddite) shells for the use of the British Army as well as for the Navy. These were inspected by government officials, boxed and shipped, and only required the addition of the bursting-charge to be ready to go to the guns. The shrapnel was also charged here with the requisite weight lead-alloy bullets.

Among the classes of forged steel projectiles turned out by the Nova Scotian munition workers were:

12 and 14-pounder (3-inch) shrapnel shells for quick-fire guns used by the British Navy in auxillary batteries for defense against torpedo-boat attack.

18-pounder (3.3-inch) shrapnel and also common lyddite (high explosive) shells for quick-fire guns of the light batteries of the British Field Artillery.

4.5-inch common lyddite (high explosive) shells for quick-fire field howitzers of the howitzer batteries of the British Field Artillery.

60-pounder (5-inch) common lyddite (high explosive) shells for breech-loading guns of the heavy batteries of the British Field Artillery.

9.2 inch common lyddite (high explosive) shells for siege howitzers of the British Siege Batteries.

Some firms, such as the Brandam-Henderson, Ltd., of Halifax, took up the work of casting shrapnel bullets from lead-antimony alloy, and prosecuted their work both night and day, their product after inspection being barrelled and shipped to the shell factories.

It is impossible at the present time to give figures to show to just what magnitude all this war-time industry attained, as the secrecy which surrounded all such works at the time has caused quantitative returns to be, as yet, kept in the background. It was, however, an industry of great proportions, and the output was a direct contribution to the cause for which the Allies were fighting.

It is satisfactory to note that about April, 1918, arrangements were made with the Dominion Iron and Steel Corporation, under which that company will erect a plant at the cost of three to five million dollars for the construction of ship's plates, and will be in a position to turn out 150,000 tons of ship steel annually, beginning in July or August, 1919. This will have a very important bearing upon the programme of Dominion-wide shipbuilding which is now being carried out to replace losses caused by the war.

Railways:—In 1915 the Eastern Car Company, New Glasgow, N.S., constructed many cars for the Russian government as well as for France. In filling these orders, our iron-workers were required to produce large numbers of axles, wheels, and other metal fittings.

Toluene.

The urgent demand for a continuous and ample supply of material for the production of modern high-explosives for military purposes, and the knowledge that great quantities of coal-tar could be readily produced in Nova Scotia, soon led to the distillation at Sydney of large amounts of toluene, toluol, or methylbenzine, a liquid chemical product akin to benzine, and obtained from coal-tar by rectification of the fractional boiling between 100 and 120 degrees. It derived its name from having been first obtained by the dry distillation of tolu-balsam; whereas now the most abundant source is coal-tar, from which it is derived by a process of fractional distillation. The toluene produced in Nova Scotia was subsequently nitrated at Quebec, and thereupon became the crystalline substance, with excessively violent explosive properties, when properly detonated, to which the now well-known name trinitrotoluene (TNT) has been applied, a high-explosive which has proved a large factor in the war, both on land and sea. It was 204,000 kilograms of this explosive from the United States, with 2,114,000 kilograms of picric acid and 56,000 kilograms of gun-cotton which destroyed part of Halifax when the steamship "Mont Blanc" blew up on December 6th, 1917.

Little has been known about the production of toluene in Nova Scotia, as the usual secrecy surrounded all that related to it as in the case of other munitions. The first issue of it here was in April, 1915, and from then until the end of November, 1918, over 705,000 gallons were produced. After the war, a proportion of the toluene output might possibly be utilized in dye production.

Stibnite.

Some activity was shown in the production of stibnite from the well-known mine at West Gore, Hants Cp., N.S. This mine was re-opened in 1915 and in that year 10,872 long tons of ore was raised, which increased to 14,149 tons in 1916, and dropped to 10,660 tons in 1917, in the summer of which year the mine ceased operations owing, it is reported, to a pinching of the deposit. This mineral is a valuable ore of antimony, and also here carries gold values, and it is largely utilized in preparing the lead-antimony alloy from which shrapnel bullets are cast.

Scheelite.

The scheelite mine at Sheelite, Halifax Co., N.S., was closed subsequent to 1913, after a certain amount of tungsten ore had been extracted. It was re-opened in 1917 and some 50½ long tons of scheelite were raised, but the mine was subsequently again closed.

Manganese.

Nova Scotia has the well-known reputation of having produced some of the highest grade manganese ore that has been on the market in the past. No returns, however, were made in 1915, but in 1916 there were produced 544 long tons of ore, while in the next year, 1917, the returns gave 180 tons. In 1918 some ore was produced at Loch Lomond, C.B., by C. V. Wetmore of Sydney, and the Rossville Manganese Co., operating near New Ross, Lun. Co., had a shaft and were engaged in exploratory work, but unfortunately had their headgear destroyed by fire.

Molybdenum.

A little molybdenum ore was produced in 1917 near

New Ross, Lun. Co., from a property recently opened at New Russell, but it has not yet had time to be sufficiently developed to become an extensive producer, although such work is in progress. Some of the development work in the mineral deposit referred to above, was carried out under superintendence of the Munitions Commission.

Gold.

The gold production has fallen off, one of the causes being the dry seasons which interfered with the operations of the hydro-electric plants as in 1916, and another being that mines which had been operated at a profit in normal years have been unable to do so in wartime in consequence of the great scarcity and advance in cost of labor resulting from the drafting of men into the army and the high pay offered by munition and other works, as well as the greatly advanced price of materials.

The gold production of the province during the period of the war has been but a few thousand ounces. The total gold production of Nova Scotia from 1862 to 1917, was 956,497 ounces from 2,187,493 tons of ore crushed, which shows the high average yield of 2.28 ounces per ton.

Gypsum.

There are inexhaustible deposits of good gypsum on tidewater in Nova Scotia, and the trade in it is a large and rapidly growing one. The output of recent years has been,—in 1914, 283,340 short tons; in 1915, 230,216 tons; in 1916, 279,400 tons; and in 1917, 298,108 tons and 10,000 tons of calcined plaster.

Barytes.

Excellent barytes for use in paint manufacture occurs at Lake Ainslie, C.B., and 1,400 tons were mined in 1914, 750 tons in 1915, 1,262 tons in 1916, and 2,400 tons in 1917. Deposits are also located in various other parts of the province.

Moulding Sand.

Moulding sand has been produced to some extent for use in foundries, the amounts being 430 tons in 1914, 800 tons in 1915, 500 tons in 1916, and 250 in 1917.

Other Produce of Nova Scotia mines and quarries are tabulated below and in some instances amount to large quantities. The feestones of the province are well-known for their excellent quality and pleasing variety of tints.

	1914.	1915.	1916.	1917.
Building stone, short tons	15,468	39,654	32,399	24,711
Cement blocks, number	.....	.....	15,000	25,000
Bricks, number	14,543,608	1,922,100	19,504,987	13,598,075

Salt.

In the autumn of 1918 a bed of salt was discovered near Malagash, N.S., and is now being prospected with a shaft and bore-holes. Fishery salt was greatly in demand at one period of the war, and the discovery of a workable deposit in this province would be a great benefit.

Prospecting.

There has been a considerable revival of prospecting for minerals which had gained an increased demand and a higher value during the war; and numerous enquiries were made by firms looking for workable deposits of various minerals and ores which had come into prominence through the shutting-off of the supplies which had formerly come from Germany.

To assist prospectors and those developing known mineral deposits, the government of Nova Scotia possesses core-drills of various sizes and kinds, which may readily be obtained on paying running expenses and for wear to the cutting material. These drills have done a large amount of excellent exploratory work in past years, and have saved much labor and money which would otherwise have been expended in sinking trial shafts. They have also contributed, through their published logs, to our knowledge of the geology of the province.

MINISTER OF MINES OF BRITISH COLUMBIA VISITS OTTAWA IN INTERESTS OF MINING INDUSTRY.

While in Ottawa, Hon. Wm. Sloan, Minister of Mines, will take up with the Dominion Government a number of matters of first importance to the advancement of the mining industry of this Province, one of which will be the matter of effecting an arrangement to throw open Indian Reserves of this Province to miners. As far as the Province is concerned, its policy already has ben defined by certain amendments to the "Placer Mining Act," and the "Mineral Act," and it remains for the Dominion to declare itself in agreement with the principle thus laid down for the areas to be thrown open to development by the Lieut.-Governor's proclamation.

Another matter which the Minister will discuss is the advisability of placing under Provincial control the minerals within what is known as the Railway Belt in this Province. Under the terms whereby the Canadian Pacific Railway was built through British Columbia to the Pacific Coast the base metals for forty miles on either side of the railroad were handed over to the Dominion Government. Mr. Sloan has a proposal to make to the Ottawa Government, having in view the assumption by the Province of this authority to the end that a policy of developing the minerals within the area, particularly the coal and iron, may be proceeded with. He maintains that the dual system of mineral administration from the Coast to the Rocky Mountains along the line of the C. P. R. has had and continues to have the effect of retarding the progress of the mining industry and thinks it would be beneficial to the Western country to have the minerals within this forty mile strip solely under the Provincial Department of Mines. His position in this respect is exactly the same as it is with regard to the E. & N. Railway Belt on Vancouver Island, which has been referred to heretofore.

There are other questions, however, to be laid before Ottawa which also are of the utmost moment. One is that the Federal Administration should give practical evidence of its interest in the development of the iron ore resources of Western Canada by supplementing the British Columbia Bounty on the manufacture of pig iron from locally produced ore. He would have the Dominion offer such an additional bounty as would make the initiation of the industry in the Pacific Northwest irresistibly attractive to capital.

The Federal Government will be asked, also, to grant financial aid for the establishment in British Columbia of an experimental station for comprehensive mineral research, which would include flotation processes, treatment of complex and refractory ores, utilization of coal by-products and other chmical determinations.

Mr. Sloan estimates that an adequate experimental station would cost between $150,000 and $200,000, and states that the logical site for it would be at Point Grey, Vancouver, in connection with the British Columbia University, on the buildings of which the Provincial Government will spend this year some $500,000. He thinks, therefore, that it is the proper time to make an effort to secure such a University adjunct, asserting that it would very materially and most profitably enlarge the scope of the present mining school. "In this Province," he says, "the miners are confronted with many difficulties in the treatment of complex ores. With an Experimental Station, equipped for scientific research and skilled laboratory work, many of their problems would be solved, and they would be enabled to obtain much fuller returns on the various minerals found in our ores."

Mr. Sloan also proposes to bring before Ottawa the question of the Dominion Government making a grant to aid the Province in carrying out its policy of assisting miners in the construction of roads and trails to promising prospects and mines.

Finally the Minister will talk over with Hon. Mr. Burrell, Minister of Mines, the plans of the Dominion with respect to geological survey work in the West this summer. He is very appreciative of what has and is being done by the central government along this line, and hopes that the activity of the past will be continued.

BRITISH COLUMBIA COAL AND COKE PRODUCTION.

Statement of Coal and Coke Tonnage Returns for the Month of February, 1919.

	Tonnage. Coal	Tonnage. Coke
Canadian Collieries, Ltd., Comox	50,691	1,938
Canadian Collieries, Ltd., Extension-Wellington	19,535	Nil
Canadian Collieries, Ltd., South Wellington	5,566	Nil
Western Fuel Co., Nanaimo	59,105	Nil
Pacific Coast Coal Mines, Ltd., South Wellington	4,719	Nil
British Columbia Coal Mining Co. (Leased), East Wellington	2,748	Nil
Nanoose Collieries, Ltd., Nanoose Bay	500	Nil
Crows Nest Pass Coal Co., Michel	14,195	4,970
Crows Nest Pass Coal Co., Coal Creek	21,684	3,805
Corbin Coal & Coke Co., Corbin	3,172	Nil
Middlesboro Collieries, Middlesboro	3,935	Nil
Princeton Coal & Land Co., Princeton	2,051	Nil
Fleming Coal Company, Merritt	3,729	Nil
Granby Company, Cassidy's Landing	3,891	Nil
Coalmont Collieries, Coalmont	800	Nil
Telkwa Collieries, Telkwa	236	Nil
Total tonnage	195,557	10,713

THE NIPISSING REPORT.

In his report for the year 1918 President E. P. Earle, of The Nipissing Mines Co., says:

"It is a pleasure to again report to stockholders the results of a very succesful year's operation of The Nipissing Mining Company, Limited. Conditions have been most unusual. Materials of all kinds used in our mining operations advanced greatly. The wages of our employees have been materially increased, and an unusually large sum had to be set aside for war taxes. Fortunately the rise in the price of silver offset the large increase in the cost of operation, with the result that the net profit was as much as in the previous year. The production of the mine was 3,701,416 fine ounces which was sold at an average price of 99.14 cents per ounce at Cobalt. The net operating receipts were almost $2,600,000. Dividends paid were $1,800,000, which brings the total sum distributed to the stockholders up to $19,140,000. As has been previously stated, stockholders should bear in mind that the large dividends paid by the company should be considered as in part a return of capital. The surplus has increased from $2,731,000 to 3,441,000. Development of new ore did not fully make up for the large production, so there is some decrease in ore reserves, which now stand at about 6,000,000 ounces. The mines and mills are fully equipped to handle our production in a most economical way. It is especially gratifying to your directors to be able to state that the properties of the company have been operated at full capacity throughout the war, without any trouble with its employees."

Kirkland Lake's New Mill.

Milling operations were commenced on a large scale at the Kirkland Lake Gold property, in the Kirkland Lake camp recently. Certain portions of the milling equipment have already been tried out and found to give highly satisfactory results. The workings of the mine have been carried to a depth of 700 feet, and the orebody showed every indication at this point of continuing to still greater depths. This is the deepest working in the Kirkland Lake camp to date. A large quantity of milling ore is on the surface dumps ready for treatment in the new mill, and the new central shaft is being connected up with the various workings of the mine to the 700-foot level, which will greatly facilitate the handling of the ore in the future. The Kirkland Lake Gold Mines is owned by the Beaver Consolidated Silver Mines of Cobalt, and has been brought to its present state of development by the latter company. The mill is conceded to be one of the most modern in the north country.

Mr. M. J. Carrigan, of Seattle, certainly deserves that new addition to his name "Pig-Iron" Carrigan. He earned it.

Eli Carpenter, Discoverer of the Slocan

By J. C. GWILLIM.

Eli Carpenter, who discovered the Slocan, B. C., silver-lead camp in 1891, died near Salmon Arm, B. C., in January, 1917. Many old-timers of the Kootenay country will be interested to have some account of him since he left that district in 1898 to find his way, by the Edmonton route, to the Klondyke.

He was then about 60 years of age and some of us did not expect to hear of him again. Rumors came that he was trapping on the Athabasca; and then that he was dead. Two years later he turned up in Dawson.

By chance I met a Mr. C. H. Ivens, of Salmon Arm this winter. He said he had helped carry Eli Carpenter to his grave, and this inclined me to make some enquiries of his later history, so that there might be some record of a brave old man whose life, as one of his friends, a pioneer of Slocan, says brings to my mind the words of the poet: "Many towns claim Great Homer dead, through which the living Homer begged his bread."

No one seems to know where Eli Carpenter was born. He was a French Canadian, small, dark and wiry, rather reticent and modest about himself. According to his own allusions, he ran away from his home in Quebec, and was, in his youth, an acrobat and tight-rope walker, during which period he crossed various canyons on a rope. Bruce White, who died at Nelson last winter, and was companion to Eli on some of his trips in early Slocan days "always contended that Eli was the original Blondin who walked across Niagara Falls on a tight rope, but (says Mr. Neil MBething), I do not know what led Bruce to believe this." Certain, it is that one Dominion Day about 1897 he crossed the main street of Slocan city on a rope thirty feet from the ground repeatedly and threw in a few fancy tricks while up there. He was about 60 years old and hard up then, and an honorarium of $50 was oclleeted on the spot.

In 1890 southern Kootenay was the mecca of western prospectors. The Hall Mines "Silver King," had been found by Colville half-breeds, and Rossland Red Mountain by Bourgeois and Moriss. Colville Joe" and Indians told of rich mineral deposits in the Slocan Lake district. So Neil Gething and Bill Springer crossed the mountain ranges from Kootenay Lake to the head of Lemon Creek and thence down Springer Creek to Slocan Lake in 1890. They were probably the first prospectors who reached Slocan. Some of their assay samples carried good values; but on their return to Nelson, Joe Moriss and Joe Bourgeois turned up from Trail Creek with news of the Rossland discovery, and this diverted attention away from Slocan until the next year, 1891.

Prospectors were now working up the creeks on the western side of Kootenay Lake, and amongst them was Eli Carpenter who is said to have been "grubstaked," by Scott McDonald of Hot Springs (Ainsworth). Eli made his way up Kalso Creek for some twenty odd miles through thick brush and down logs following the valley to the divide and over to Carpenter Creek, which flows the other way, into Slocan Lake. Getting short of grub he decided to return to Kootenay Lake by way of the mountain ridges so climbed up Payne Mountain, which rises above the three forks of Carpenter Creek and has a grand view down the creek to Slocan Lake, and the glaciers on the other side of it. Here he found float galena, and after some search, the outcrop of the Payne Mine near the summit of the ridge. His location was made. The ore, assayed at Ainsworth, ran over two hundred ounces of silver to the ton. Mr. Angus McInnes, mining recorder of New Denver has made an "abstract" of the original record, it is:

Mineral claim—Payne.
Located by—Eli Carpenter 34566, John Seyton 39686.
Situate—About twenty-five miles west of Kootenay Lake in the head waters of Slocan Creek.
Direction of centre line—North-east and south-west.
Length—1,500 feet.
Located on 9th day of September, 1891.
Recorded this 22nd day of September, 1891.
Recorder—T. H. Griffin.

Eli Carpenter's discovery caused a stampede, and there was a wild scramble to get locations before snow fell. He seems to have returned himself, for that same fall. Mr. Neil Gething says; Bruce White and Eli were returning by way of Slocan river, when some one's dog robbed their outfit. Coming across an old trapper's cabin they found an ancient wild swan suspended. " Bruce was afraid to eat it on account of it being so old, and also of the possibility that it might be poisoned for bait, but Eli, who was very hungry, could not agree with Bruce, and said, 'Bruce, if we have got to die, we might as well died with our belly full.' "

In that same fall or winter Eli Carpenter sold the Payne prospect to Eteve Bailey for five hundred dollars (at a later period this mine paid over a million in dividends). Bailey opened up the mine in the following summer. Quoting Mr. Gething: "Eli was a mildly disposed man and bore but little animosity to anyone, but I remember one incident in which he seemed to be completely upset. It was late in the fall and prospecting was all over, and of course Eli's money was all gone by this time, so he rolled up his blankets and packed them on his back started up the hill, from the hotel, to where he was sure of a job from his friend Bailey, in the mine he had sold for five hundred dollars. When he arrived at the mine he found everything going fine, but was informed: full handed.' So old Elie had to take up his bed again and look for a job in another place."

In 1895 prospecting shifted to the "dry ore" district at the southern end of Slocan Lake. Eli cruised round these hills for awhile without finding much. He was an occasional contributor to our assay office in Slocan City, and on one occasion said he would like me to teach him how to assay, but he never turned up for instruction. He referred to experiences in Colorado, and I think must have come from there to the Kootenay. It was during this period that he astonished us with the tight rope performance.

In 1898, like thousands of others, Eli started for Klondike; but he chose a bad route. He left Edmonton with others, and after two years wandering arrived alone in Dawson, "nearly starving and almost

naked." Some accounts say that he and his companions went by way of the Peace and Mackenzie rivers, thence up the Laird and across the portage to the Pelly, a branch of the Yukon. At any rate he finished alone, and is said to have considered this "breaking trail from Edmonton to Alaska as his greatest achievement." His old associates used to say that "given matches and a small sack of salt he could stay in the mountains for months, for he could make meals out of everything in sight."

Before leaving on this trip he gave to Wm. Thomlinson of New Denver, who first met him in 1892—"the carbine which he carried on all his explorations for many years previously; and he also gave me the historic pole pick with which he broke the first float found from the Payne mine, the first mineral claim to be recorded in this camp. I still have these mementos of that brave little pioneer."

Arrived in Klondyke, he is said to have got some hydraulic ground which he worked out in one year by putting on a night shift but made little out of it account of the large amount of waste. Others say he made some money, and he is credited with having made two fair fortunes in his time which were easily squandered on the less fortunate.

About 1911 he reappeared on the prairie east of Calgary, and gathered some stock together; but was found to be squatting on a school section, from which he had to move. At this time he was thrown from his cayuse and broke his leg. After a period in a Calgary hospital he decided to go prospecting again in British Columbia and took a ticket for Kamloops. On his way to the train he slipped and broke the newly set bone, but in spite of that boarded the train and arrived at Kamloops where he went to hospital again. He was now about 75 years old.

Here he fell in with a man from Celesta, near Salmon Arm, and went there with him. Quoting Mrs. Jackson of Sicamons, who came to know him well, "This plan was carried out but did not work well. E. C. found his money getting less and apparently 'nothing doing.' So, although the lake (Shusways Lake) was frozen, our friend decided to pull out for Sicamons. He left Celesta early one morning on a small handsleigh, with a couple of blankets. As he was obliged to use crutches in moving about, he fixed a bent nail in the end of each, and, sitting on the sleigh propelled himself along. He made 24 miles that day, and when dusk came he made camp in Hungary Cove, a few miles north of Murdoch Point, which is opposite Sicamons. Next morning he found that had he proceeded, it would have proved disastrous, for a little further on the lake had opened up."

From Sicamons he made his way to Australia, and stayed in that country two weeks. He is said to have found gold there, but no water to wash it. In 1913 he returned to Shuswap Lake.

"He seems to have been attracted by Shuswap Lake and neighborhood, so arranged to take up a homestead, where, as he put it, he could make a place to die in. He seems, at this time to have felt that his luck had given out and he did not want to go to the Old Man's Home (at Kamloops), though for years he seems to have been a regular subscriber."

His homestead at Anesly Arm was well timbered; he made his improvements, put in a flume, waterwheel and rough saw-mill; made and graded a wide road for three-quarters of a mile and cut 50,000 feet of lumber. This mill had in its framing 30 foot tie timbers and was erected by Eli entirely without assistance. "When one recalls that, at this time he was nearly 80 years old, his extraordinary will-power is better understood." Another mill which was to have taken his logs, all ready for booming, shut down, and he had to face the winter with little money and great disappointment.

A young man, Albert Brock, lived near by. "Many's the time," to quote our friend, "did this young man Albert Brock give him half his fish," otherwise the old man would have gone hungry."

"It was at this time," Mrs. Jackson says, "that we were able to fill quite a blank in helping him out." . . . . In 1916 his hand became badly mangled between the belt and the wheel of the mill, forcing him to seek medical advice; so he came to Sicamons and on to Salmon Arm. Here the local constable found him the position of night watchman at McConnel's closed mill so that he felt independent while having his hand attended to."

Mrs. Jackson continues, "All through that winter he was a regular visitor in our home, being just over the lake from Annis. The week prior to his death he spent here, preparing things for his return to his own mill, so soon as the lake opened up. He left us on Friday, we visited him on the following Sunday, sat with him and left him full of hope and good spirits. He was like a boy in his enthusiasm to get back to his mill again.

"On Wednesday, January 23rd, he was found dead in his bunk, with his head on his arm, apparently just dozed off. So, as he seemed to have no one but ourselves, we took him to Salmon Arm, where Mr. West, the Church of England clergyman, buried him on January 26th, 1917."

Mrs. Jackson adds, "He was so shy with strangers and had so little vanity, that I should doubt if a portrait o fhim is to be had. I wish there was some way of getting together enough money to put a stone over him; just to let people know that that brave spirit is in some way connected with it. Do you suppose it would be any use appealing to the readers of The Canadian Mining Journal?"

If any old acquaintance who reads this account cares to perpetuate his memory and the early days of Kootenay, the writer, or the "Canadian Mining Journal" will accept subscriptions for a simple monument.

TO MAKE ENGINEERING A CLOSE CORPORATION.

Mr. Walter J. Francis, Mr. Surveyor and Mr. Brown of Montreal, were entertained to dinner at the Engineer's Club, by the Toronto branch of the Engineering Institute of Canada. They afterwards addressed a well attended meeting on the affairs of the institute. The meeting was presided over by Mr. A. H. Harkness, M.E.I.C. Mr. Francis spoke on the activities of the Engineering Institute. Mr. Surveyor spoke on the question of securing legislation to make the engineering profession a closed corporation, similar to doctors, lawyers, surveyors, dentists and others. Mr. Brown advocated one great national institution of engineers for Canada, and that engineers should loyally support the same.

The University of Washington was well represented with Dean Roberts and his sister, Professor Landes and Professor J. H. Daniels.

Special Correspondence

Will Test B. C. Iron Ores.

Action has been taken to commence at the earliest possible moment proposed experiments with a view to determining the practicability of producing from British Columbia iron ores, and within the Province, pig iron of such quality and at such a cost as to permit it to take its place successfully in a competitive market.

Authority was given Hon. Wm. Sloan, Minister of Mines, to take the necessary iron ore practically from wherever it may be found by the terms of an Act passed at the recent session of the Provincial Legislature and entitled the "Iron-ore Supply Act." Mr. Sloan since has left for Eastern Canada but, prior to his departure, instructions were given Mr. Wm. M. Brewer, District Mining Engineer, to take the necessary steps to obtain quantities of iron ore for shipment to those plants which have asked for it. Two smelters, situated near Vancouver, B.C., have undertaken to make the changes required for the treatment of the magnetite ores and it is thought likely that there will be others ready before long to undertake the production on a smal scale of pig iron should the experiments decided upon prove satisfactory. Naturally, however, the firms which have sought the Government's assistance will be first taken care of in the distribution of ore.

The terms of the Act, which are sweeping and are generally approved in the Province, permit the Department of Mines to expend up to $50,000 in this work. The key clause of the legislation reads as follows:

"Where, in the opinion of the Minister of Mines, it is necessary or expedient to procure a supply of iron ore for treatment for experimental purposes in aid of the development of the iron and steel industry in the Province, he may, by himself, or by any person authorized by him, enter upon, take possession of, and occupy for such time as he may see fit any mining property in the province and mine and take therefrom any iron ore from thereon or thereunder; and may cause the mining and the removal of the iron to be carried out, and the ore to be supplied and delivered free to any smelting plant in the province for treatment therein for the purpose of experiment in the production from crude ore of pig-iron of a merchantable quality."

Other provisions are that no unnecessary damage shall be done or caused to any mining property so entered upon and that compensation shall be paid to the owners "computed at the maximum rate of 25 cents per ton of ore removed, or at such lesser rate as may be agreed upon. The usual tax on iron ore shall not apply in respect of iron ore so mined and removed.

Would Prevent Dumping of Metals.

At a recent meeting of the Trail (B. C.) Reconstruction Board objection was taken to the marketing in Canada of foreign metals and representations were made to the Dominion Government as indicated by the terms of the appended resolution:

"Whereas the whole interior of the Province of British Columbia is largely dependent upon the mining and smelting industry and these industries are most seriously affected at the present time owing to the demand for copper and lead being almost negligible; and

"Whereas such markets as may exist are flooded with metals dumped into Canada from other countries; and

"Whereas tremendous stocks of these metals exist in Canada at the present time and, if relief is not quickly forthcoming, the entire industry will collapse and throw approximately 15,000 men out of employment; therefore be it

"Resolved by the Trail (B. C.) Reconstruction Board on this 24th day of March, 1919, that the importation of these metals into Canada be allowed only by special permit of the Dominion Government until the stocks of metals now on hand are disposed of and money tied up in these stocks is released to carry on the industry again."

To Explore Coal and Oil Fields of B. C.

"The Coal and Petroleum Appropriation Act, 1919," is the title of a measure introduced by Hon. T. D. Patullo, Minister of Lands for British Columbia, during the last session of the Legislature and which has become law. It provides authority for the expenditure of $50,000 in the investigation and exploration of potential oil fields in this province. The exploratory work also will have in view the location and the obtainig of all possible information as to the possibility of developing on Crown lands new coal producing areas. While the field researches for which the Department of Lands is preparing may be taken to be directly primarily to ascertaining whether the province is possessed of oil in any quantity, the possibility of finding petroleum and natural gas will not be lost sight of. It is understood that attention first will be directed to the lands of the Peace River District, in the neighborhood of the Alberta boundary, where more or less perfunctory examination has given rise to the hope that oil in considerable quantity exists. This country is sparsely settled, is without transportation of any but the most crude character, and, if general but somewhat indefinite reports which have been received from occasional prospectors at rare intervals are to be given credence, it is rich in natural mineral and kindred resources. The advisability of the Provincial Government undertaking systematic exploratory work in this area was emphasized by discussion and resolution at the recent International Mining Convention held at Vancouver, B.C.

Advocates More Geological Survey Work.

With reference to the generally admitted need of more detailed knowledge of the resources of British Columbia it is interesting to note comments made by Charles Price-Green, Industrial Commissioner for the Canadian National Railway, who visited the Pacific Coast recently with a party of officials of the Canadian Northern Ry. At present he is making a general survey of the country with a view to the establishment of new industries based on natural resources and, having an intimate and practical knowledge of mining, he has been giving special attention to the mineral possibilities of this Province. In this connection he recommends very complete geological surveys of the mineral lands and a personal canvass of the money-

ed interests of Great Britain with a view to further investments in mineral development. He says that there never was so much money for investment in Great Britain as to-day. As a resutl of the war, money is not held in as few hands as formerly and Mr. Green avers that trust companies are "fairly bulging with funds for investment." Other portions of the Empire have been able to draw large sums from British investors and he believes that proper representation will bring much to the Dominion. Heavy English investors have pointed out to him the necessity for extensive geological survey work in Canada. While having a general knowledge of the mineral possibilities of the country they insist that it is essential that more and accurate information should be available. He recalls that it was extensive geological survey work that opened up the Cobalt area. Mr. Green's investigations have convinced him of the enormous mineral wealth of Canada and he states that British Columbia especially has much of the economic ore that is so largely used in many kinds of English manufacturies. These, he is confident, will receive recognition shortly and that this province is due for general development in respect of its mining industry, As to the iron industry he is not so hopeful at present, as there does not appear to be an assured market, but says that it will come in time.

Prospecting Rights on Indian Reservation.

Two measures passed at the last session of the British Columbia Legislature affect the mining industry in an important manner. One of these provides for the amendment of the "Placer Mining Act," to permit every free miner, during the continuance of his certificate, to "enter, locate, prospect, and mine for gold and other precious metals and stones" upon Indian reservations. The other amends the "Mineral Act" to permit holders of Free Miners' Certificates to "enter, locate, prospect and mine" upon Indian reservations. In extending the right of access to Indian reservations to miners Hon. Wm. Sloan is following out the policy which he enunciated at the time of coming into office, namely, that there should be as little restriction to the finding and the development of the mineral riches of the province as possible. His passage of an Act throwing open the Strathcona Park, a large area on Vancouver Island, to mining operations was directed along this line and the steps now being taken to reach an understanding with the Esquimault & Nanaimo Ry. Co. to abolish the present dual control of the minerals of the Island Railway Belt is another move towards the same end. The existing arrangement with regard to the latter area is that mining regulations promulgated both by the province and by the Railway Company govern the acquiring of title to minerals and their commercial development. Mr. Sloan would have the province placed in full control. As to Indian reservations it is the contention of the Minister of Mines that the province never relinquished its right to the minerals in these lands and he quoted from a document fifty odd years old to prove that this principle always has been maintained by the province. The result is that large new areas are thrown open to the prospector and it is felt that the mining industry will receive a material fillip in consequence of this action.

These amendments to the "Placer Mining Act," and the "Mineral Act" of the Province of British Columbia do not come into effect until proclaimed law by the Lieut.-Governor of British Columbia. The Dominion Government, it should be explained, is the legally constituted guardian of the Indians and it may take the position that the Province has no authority to permit miners and prospectors upon Indian Reservations for purposes of engaging in mining. It will be necessary, therefore, before the said Proclamation is issued for the province to come to some understanding with the Federal authorities on the point and this matter already is being taken up by the British Columbia Administration with Ottawa in the hope and belief that it will be possible to arrive at an amicable settlement. That prospectors should be barred from operating on Indian Reserves is held to be unreasonable on more than one premise, but one of the most forcible advanced is that the ordinary holder of private property, under the mining laws of the country, cannot withhold the privilege to the miner of entering upon his land for the purpose of mining providing he puts up bonds assuring the land proprietor of indemnity should the work undertaken result in damage to the said property. It, therefore, very properly is asked: Why should the Indians be singled out for very special treatment in this respect?

Reopening Anyox Plant.

Little difficulty apparently is being experienced by the Granby Consolidated Mining & Smelting Company in obtaining the 1,200 men necessary for the re-opening of its plant at Anyox, B. C. Very shortly after the announcement in Vancouver that the men were needed upwards of 300 were signed on, many of them being returned soldiers. As many of those being taken on are mechanics, which it may be stated was not expected, it may be presumed that the company's requirements soon will have been satisfied, the Anyox plant completely manned and in full operation.

Operating at Copper Mountain.

Operations have been commenced at Copper Mountain by the Canada Copper Corporation. Many employees who have been residing at Allenby, B.C., have moved with their families to the mountain for the season's work.

French Complex Ore Reduction Co.

The French Complex Ore Reduction Company, which has a plant near Nelson, B. C., designed to experiment in the treatment of the complex ores of this province, was granted $25,000 by the Provincial Government in 1918, the same to be a charge on its assets. Of this amount the Government held back a sum to meet back interest payments on bonds previously guaranteed by the province on behalf of the company. Thomas French, manager for the company, claimed that this seriously handicapped him in the work he has in hand and made representations along this line to the mining committee of the British Columbia legislature during the late session, As a result it is announced that the Government will release to him $7,906, which represents the total of the aforesaid interest. Mr. French states that, providing this financial relief is forthcoming without delay, thus obviating unnecessary overhead expense, it would be sufficient to enable him to demonstrate the commercial feasibility of the French method in the treatment of complex zinc ores. Owing to past delays he states that his expenses have been excessive.

Initial Dividend Paid by Belmont Surf Inlet Co.

Considerable interest has been created in Provivncial Mining Circles by the recent declaration of an initial dividend of a 5 per cent. by the Belmont Surf Inlet Mining Company. The company has a capital of $2,500,000, and has spent about $1,500,000 in the installation of a plant. The ore, which runs from $12 to $15 a ton in gold values, is concentrated at the mine and then shipped to the Tacoma Smelter. Considerable of the stock is held in Vancouver, Victoria and other British Columbia cities.

Title to Coal Lands Still in Doubt.

When the British Columbia Legislature prorogued a few days ago the Lieut-Governor withheld his assent to one of the measures passed, namely, the Settlers' Rights Act of 1919. This is the Bill which would have given the old settlers or their dependents, with homes in the Esquimalt and Nanaimo Railway Belt on Vancouver Island a further opportunity to make application for the coal rights in connection with their property. It is not necessary to go into the history of this matter again, it being sufficient to say that the issue now is straight cut betweent the jurisdiction of the Dominion and the Province and that the stake to those directly interested is title to a large section of coal-bearing lands of the Island. On the question of jurisdiction the province maintains that it has absolute power with respect to the administration of matters pertaining to civil and property rights, within which classification comes the proprietorship of the coal referred to. Just what position the Dominion Government takes it is not so easy to define, but that it is responsible for the Lieut.-Governor's action in refusing to give his assent to the enactment of the Legislature there is no doubt. It may be that its argument is that title to surface and under-surface rights in these Island lands passed from the Province to the Dominion, and from the latter to the E. & N. Co. in 1884; that the E. & N Co. since has sold the under surface rights to the Canadian Collieries (D) Ltd., and that the latter, having raised a considerable sum on this security, should be protected, if only in justice to the bondholders. In other words the Federal authorities possibly take the view that there was a legal and valid bargain between Province and Dominion and the Railway Company and that, bad bargain as it may now be considered from the standpoint of the Province, and inadequate as may have been the conservation of the rights of settlers or squatters, "a bargain is a bargain," and should be maintained inviolate. It is to be noted that, because of the action taken by the Dominion Government, the Province finds itself in the position of being forced to defend its right to the sole administration of "property and civil rights" within its domain. These rights are part and parcel of the "Terms of Union" and it is considered most serious, apart altogether from the rights of the Canadian Collieries or of the settlers affected, that the Federal Government should so interfere with Provincial legislation of this character. It is very probable, therefore, that both because it believes the settlers have a good case and have been unjustly treated and because the powers granted the provinces under Confederation must be upheld that British Columbia will not allow the matter to drop where it now stands.

Arising out of the Settlers' Rights Act of 1917, an action was heard recently before the British Columbia Court of Appeal. This measure has force and effect for about a year before it was disallowed by the Dominion Government and in that period Provincial Licenses were issued to a number of settlers. A few of the latter sold to the Granby Consolidated Mining & Smelting Company, which, as a result, commenced development work, the fruit of which is the new and flourishing colliery at Cassidy's, Vancouver Island. To maintain what it considers to be its rights the E. & N. Railway Co. entered suits against a number of those who thus acquired Provincial Title, among the latter being those who had disposed of their holdings to the Granby Company. A *lis pendens* was filed against the lands and the Registrar-General refused to register the grants to the Granby Company until this had been removed or dealt with. It was argued for the Granby Company that the Registrar-General had no right to attempt to exercise judicial discretion, but should have accepted the documents and allowed the courts to decide the questions of law. This view was taken by the judge. While the 1917 Act was disalloyed subsequent to the Registrar's refusal, it is not thought that that will affect the decision, but that the grants must now be registered pending the final decision of the courts.

There has been argument before the Provincial Appellate Court on two other actions over these coal lands, the E. & N. Ry. Company seeking to have the licenses granted to Mrs. Dunlop, an aged settler, and to Messrs. Wilson and Mackenzie, as executors of the Ganner Estate, set aside as being null and void. In this connection it was sought to have the Attorney-General of the Province declared a co-defendant under a practice founded on an Act which dates back to the time of Henry VIII., which provides that a subject in fear of an act of injustice by the Crown may bring the Crown before the Court. The Supreme Court held with this opinion, but the Appeal Court dissolved the Supreme Court's order, the cases will proceed without the Crown being made a co-defendant.

It will be seen, therefore, that, with considerable litigation pending and with the Provincial Government much concerned over what it takes to be the unwarranted interference of Ottawa, the question of title to a not inconsiderable part of the coal lands of Vancouver Island is likely to remain unsettled for some time.

The Eight Hour Day.

Approximately 1,600 surface workers employed by the collieries of British Columbia are affected by the Eight-Hour Working Day law which came into force on the 1st of April. This legislation was passed at the 1918 session of the Provincial House, being introduced by Hon. Wm. Sloan, Minister of Mines. On the last day of the 1919 session, which has just closed, J. H. Hawthornthwaite, the member for Newcastle District, a coal mining centre, asked Mr. Sloan what action was proposed to be taken in view of a request received from the Coal Operators, particularly those of District 18, which includes Eastern British Columbia and the Province of Alberta, that the application of this law be deferred. In reply Mr. Sloan stated that the amendment to the Coal Mines Regulation Act to which Mr. Hawthornthwaite referred had been introduced and passed in the year 1918 by the terms of which an eight hour working day was granted the surface workers in and around coal mines. The House was reminded that it was proposed at that time that this legislation should become effective as from October 1 of last year. Owing, however, to representations made as to the existing working agreement between the operators and the

miners in Eastern British Columbia and Alberta, which agreement did not expire until April 1 of this year, it was decided to suspend the Act until that time. Under the circumstances and notwithstanding the representations referred to, the Minister could see no valid reason why the law should be further suspended. Accordingly he had directed that it should be enforced and the District Mining Inspector had been instucted to see that the Act was carried out without qualification. The argument of those who asked for further postponement was based on the fact that the working agreement mentioned has been continued between the operators and miners temporarily and also, it is understood, on the possibility of conditions being disturbed to the detriment of the industry in the face of a general Eight-Hour Day in this Province and no such regulation in the adjacent Province of Alberta.

A policy of selecting labor appears to be the general practice at the mines of Cobalt. Men who formerly held jobs for the reason that no others could be secured to replace them are being gradually let out and returned men and others willing to do justice to their work are being given the preference. As a consequence a higher efficiency is noticeable.

The Nipissing Report.

The annual report of the Nipissing Mining Company just issued, covering the twelve-month period ended December 31st shows the gross value of production for the year amounted to $4,040,446, as against $3,756,889 during the preceding year. Total costs of production increased, however, the cost for 1918 amounting to $1,444,350, as compared with $1,057,987 in 1917. Ore reserves are estimated at 6,005,135 ounces of silver as compared with reserves of 8,076,540 a year previous. Working profits during the year amounted to $2,506,-096, as against $2,700,000. The decline in profits as compared with production is due to the fact that during the year the cost of production averaged 39 cents per ounces of silver produced as compared with a cost of 25 cents per ounce during the previous year. In the annual report the fact is pointed out that no great success was met during the year in the search for new orebodies. In this respect it is interesting to note that during the opening months of the current year just the reverse is the case. This fact is supported by the statement in the report for the month of March where it is pointed out. "Favorable underground developments were met with at several shafts and general operations everywhere continued to be satisfactory."

Ontario-Kirkland.

The shaft of the Ontario-Kirkland, formerly the Hurd property in the Kirkland Lake field, has reached a depth of 320 feet. It is now proposed to drive a cross-cut for the purpose of tapping the main vein which left the shaft at a depth of 195 feet, as well a cross-cutting for the No. 2 and No. 3 veins, all of which parallel in comparatively close proximity. At the point where the slightly dipping vein left the perpendicular shaft it is officially stated values were of a high commercial grade. It is also stated one of the best sinking records so far attained in the Kirkland Lake camp was established by driving the shaft 120 feet in 30 working days.

Temiskaming.

The reported discovery of high grade ore earlier in the week at the Temiskaming mine has been officially denied. Also, it is learned, the completion of the deal for control of the Dolly Varden mine in British Columbia is being held up due to the settlement of various contentious matters relative to the affairs of the Dolly Varden Company.

Contrary to reports the Mining Corporation of Canada is not negotiating for the Silver Cliff mine.

Green Meehan.

Arrangements are being made to resume work at the Edwards & Wright property, formerly the Green Meehan. Plans provide for a comparatively extensive program of exploration work, as well as the mining of considerable low grade ore already developed.

ELECTRIC SPECIFICATIONS AND CONTRACTS.

Mundy, Rowland & Company, of Vancouver and Winnipeg, will undertake the building of power plants, the making of specifications covering installation of motors, pumps and waterwheels.

They have to their credit the building of large power plants, and on the Pacific Coast are completing one of the largest power plants recently installed.

Dolly Varden.

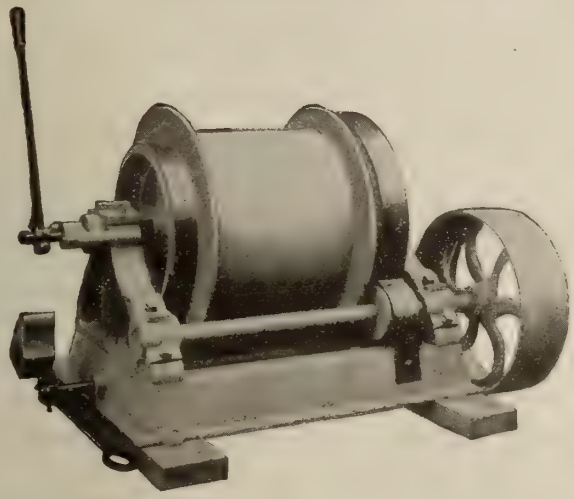
With respect to the controversy between the Dolly Varden Mining Company, owner of valuable mining property in the Alice Arm District, and the Taylor Engineering Company, which went into liquidation because of the financial burden involved in the construction of a railway from tidewater to the first mentioned company's mine, it has been stated previously that an investigation was undertaken by a special committee of the British Columbia Legislature; that a report was submitted to the Provincial Legislature; and that the report was referred back because the Temiskaming Mining Company, of Toronto, which held an option of purchase on the Dolly Varden Mine and other holdings wishes to present evidence as to its position. Since then the latter company's testimony has been taken, but it failed to affect the committee's report which was again presented without change and adopted unanimously. A. M. Whiteside, chairman of the committee, in explanation made the following statement:

"Every effort has been put forth by the committee to do justice by all parties. The committee came to the conclusion that the only manner in which to treat the matter fairly was to consider the two parties according to their investments and claims. The mining company had an investment of $640,000, while the Taylor Engineering company had a total investment of $462,000. We have said that the mining company should make the claim of the appellant company a charge on the assets, with the privilege of paying off the claim, and if this was not desirable they could have their claim taken over by the Taylor Engineering Company and have it paid off by that company. We contend there was no hardship contained in this conclusion and also that if the Taylor Engineering Company could not prove itself in a position to complete the work to the satisfaction of the Minister of Railways they should lose all they had put into the undertaking."

MINE HOISTS

Steam, Electric or Belt

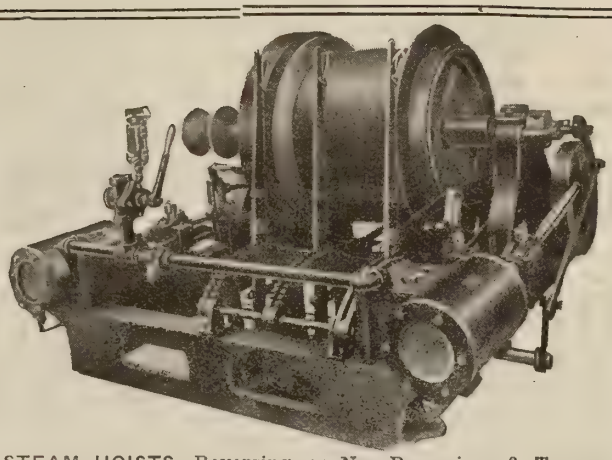
Any size you want up to 50 H. P.



BELT HOISTS, made in the same large range of sizes as the Steam and Electric Hoists.

All our Hoists are properly built to withstand hard usage. They are simple in construction, do not easily get out of order, and the repair bill is exceedingly small.

Send for Catalogue.



STEAM HOISTS, Reversing or Non-Reversing, 2 Types—Drums Friction Driven, or keyed to shaft. Operating Levers, Piping, etc., arranged to suit the buyer.

ELECTRIC HOISTS, made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears, and extended base ready to receive the motor.

Sales Agents: MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Smelter Smoke at Trail.

In the vicinity of the Trail (B. C.) Smeltery, Consolidated Mining & Smelting Co. of Canada, there is a considerable agricultural area the inhabitants of which have been complaining of the injury to their crops caused by the smoke from the company's plant. The same condition, possibly, occurs elsewhere in the province, but it is understood that the specific case mentioned and the petitions received as a result from the farmers affected, led to enactment at the last session of the Provincial Legislature designed to give the cultivators of the soil some relief. It is entitled the "Industrial Operations Damage Compensation Act" and, it is almost needless to say, is not popular among those identified with the control and management of smelters and other industrial concerns. The chief clause of this measure sets out that any company, owning or operating any reduction works or industrial plant, or proposing to acquire or operate any ore-reduction works or industrial plant, "make an agreement with the owner of any land for payment to the owner of compensation for any damage or injury resulting or likely to result to the land, or in respect of its present or future use, from the operation of the ore reduction works or industrial plant." If the company and the land owner cannot come to an agreement it is provided that application may be made to the Public Utilities Commission for the fixing of the amount of compensation rightfully due the latter. This, of course, constitutes a recognition of the claims of the farmer and there is no doubt that it will result in a settlement of the issue between industrial companies and those agriculturists in the province who have felt themselves aggrieved, but with no means of obtaining redress.

MacKinnon Steel Co., Ltd., Sherbrooke, Que.

We have just taken a contract for the supply of all necessary steelwork in connection with eight-story apartment house being erected on Drummond Street, Montreal, by R. R. DuTremblay. The name of the general contractor is Alex. MacKay, Montreal. The valuation of the complete structure is five hundred thousand dollars, and the steel work will amount to approximately sixty thousand dollars.

Huff Electrostatic Separator Co. Move to Their New Plant.

The Huff Electrostatic Separator Co., which has been located for the last fourteen years at 60 India Street, Boston, Mass., has recently acquired and fitted up a large plant at Arlington, Mass., a suburb of Boston, to which it has moved its offices, ore testing and chemical laboratories and works. It maintains a well equipped laboratory for the purpose of making either preliminary or complete tests showing the results that can be obtained commercially in the separation or concentration of minerals, abrasive materials, and reclaiming valuable content of many waste materials by the Huff Electrostatic Process. Mr. H. B. Johnson, an expert on graphite refining, is General Manager of the company.

Mine Winding Engine for Immediate Disposal

Specifications:—

Double Drum, double Cylinder, direct drive high-speed Winding Engine, Cylinders 14 x 42. Reverse Link Motion. Pistons 2¼" diam. Cross head shoes adjustable to take up wear between the slides. Running in V shape slides; Length of Engine Bed Castings (suspended) from rear cylinder cover in centre drum shaft, 16'; Solid Crank Wheels 4' diam., 3½" Rim, keyed on to Drum Shaft 6½" diam. Hollow Drums, 3'6" diam. x 4' Winding Space, Flanges 3'. Each Drum fitted with adjustable Expansion Clutch operating inside outer rims. Each Drum fitted with Band Brake—operated by Independent Levers. Overhead Throttle with Drop Lever and Lubricator.

Lever Bank:—1, Engine Reverse Lever; 2, Brake Band Levers; 2, Clutch. Long Powerful Levers operating on floor stand quadrants.

INQUIRIES SOLICITED

:-: EDITORIAL :-:

MINING INDUSTRY WANTS A REPRESENTATIVE ON CAPITAL AND LABOR COMMISSION.

At a recent meeting of the Council of the Canadian Mining Institute, it was decided to take action to obtain for the mining industry representation on the Federal Commission appointed to study the relationship between capital and labor. The name of Mr. D. H. McDougall, president of the Canadian Mining Institute, has been suggested in this connection. Mr. McDougall is well qualified to represent employers of labor. He has had much experience in the iron and coal industries, having advanced to the Dominion Iron and Steel Company before he became president of the Nova Scotia Steel & Coal Co. He is a successful manager, which means that he understands the human element in industry, as well as the technical side.

It is scarcely likely that the Government will fail to recognize the claim of the mining industry to be represented on this important Commission. That so important an industry should be overlooked when the commission was named is indication of the justice of the claim of those who have recently been agitating for more activity in public affairs by those engaged in the mining industry. We are pleased to see the Mining Institute giving evidence of its interest in this matter, and we hope that no effort will be spared to convince the Government that the mining industry must be recognized.

THE PROSPECTOR'S POINT OF VIEW.

A considerable number of leading prospectors have voiced their opinion with regard to the suggestion that claim holders are likely to be called upon to perform annual instalments of assessment work, or the alternative of paying the equivalent in taxes. Opinion seems to be largely in favor of some such measure, provided it can be applied with a minimum of hardship to the genuine prospector, and with a maximum of penalty for the "land grabbers."

Certain objections have been raised. Those following agricultural pursuits are permitted to secure patent for 160 acres of land, **with the mineral rights thrown in,** for living upon such land for a few months each year, and for clearing a few acres of land, plus fifty cents per acre. Why then should the claim holder be compelled to not only comply with doubly severe obligations, but also be compelled to perform such duties perpetually under penalty of forfeiting all rights to such property, provided his efforts are relaxed for any one period of twelve months? As the mining laws now stand a forty-acre mining claim costs its holder about $1,250 by the time patent is secured. It follows that the cost of 160 acres would amount to approximately $5,000. After reviewing this objection from various angles, it is not difficult to recognize its value. It brings to mind the question of just what affect would added compulsory working conditions or expense have upon the mining industry. Without some definite goal, that of securing a patent in due course and the attendent relief from further work, how many claim holders would stick with their claims and perform even as much work as under the present law? On the other hand, under a system of work or pay, under penalty of forfeiture, mining claims should have greater value because they would not become part and parcel of an idle area in which all work may have ceased and toward which all or nearly interest may have died.

Looking at the question from a prospector's point of view, and supported by a great deal of comment from leading prospectors, it seems that some system of work or pay, although at first appearing as likely to add to the prospector's burdens, should really enure to his general benefit. For instance, should the regulations be changed so as to require 30 days work to be done during the first three months following the staking, followed by 60 days during each of the following two years, then, instead of performing 90 days work during the third year as required under the present law, reduce the amount to 30 days for the third and all subsequent years. In this way, the claimholder, by performing the amount of work as at present required before patent, would hold the claim for a period of five years and three months, plus the expiration of an additional twelve months before his claim would become forfeited, or a total of six years and three months. By that time, in the great majority of cases at least, it would be possible to determine whether or not conditions warranted additional expenditure. If not, the claim would revert to the Crown and not be permitted to become idle. In this way the prospector would always be confronted with an area in which assessment work each year would make it active, or an area through which he could roam at will in search of hidden treasure. This would be in sharp contrast to the present situation in the majority of mining camps, where a few operating mines form the centre of activity, and where, for miles around, large areas of territory are held in idleness, under patent, and with no severe obligations to its holders.

Another point that should perhaps not be lost sight of is this: In cases where claim holders should decide to not perform the year's assessment work, but, instead, pay its equivalent in the form of taxes, the district in which the property is situated should receive the benefit of such taxes, a reasonable part of such money to go toward providing roads, trails, bridges, etc., for the general benefit of all concerned.—J. A. McR.

SHOULD ONTARIO MINING COMPANIES BE REQUIRED TO SPEND PART OF PROFITS IN PROSPECTING?

Officers of mining companies operating in Ontario will find something worth considering in the letter on "Encouraging Prospecting," which appears on another page. It is suggesteted that a tax of 2 per cent. be levied on all mining profits, the money thus raised to be expended by the company paying the tax in actual pro-

specting. The work would be under the sole supervision of the company and would be for the company's sole profit.

This appears to us as a scheme that should appeal to those who have been fortunate enough to make large profits from mining operations. We feel sure that they are ready to do their part towards making new discoveries if some reasonable plan is suggested. All know that discovery is the first essential in the mining industry. All wish to encourage the prospector. All will have more opportunities of expanding their business and perpetuating their company activities if more new discoveries are made. The scheme proposed not only points out a way in which companies can enlarge their operations, but affords them an opportunity of contributing towards the general welfare of the country by speeding up the development of our mineral resources. The prospecting tax would not be a hardship on the industry, but rather a sort of sinking fund for the provision of new discoveries. It would be at the same time a guarantee to the public that some part of the profits from successful mining ventures would be devoted to searching for other ore deposits. We believe that the interests of the mining companies and the general interests of the province would both be served by the adoption of a scheme of this sort.

GEOLOGICAL MAPPING OF MINERAL AREAS.

In the letter on "Encouraging Prospecting" will be found suggestions as to ways in which the Ontario Government might help prospectors in their search for mineral deposits.

With regard to geological mapping, the chief complaint which we would make is that there is not enough of the kind that has been done in some parts of Ontario. The Ontario Bureau of Mines, has through its geological department contributed greatly to the discovery and intelligent development of mineral areas. Unlike our English friends, the geologists of the Ontario Bureau of Mines have worked closely with the prospectors and development companies. We have had many instances of pioneering work by geologists in Ontario under the leadership of Dr. W. G. Miller, the Provincial Geologist. A serious attempt has been made to map promising areas ahead of the prospector, or along with him. Real assistance has been given.

Those who have prospected or developed prospects in such areas as Cobalt, Porcupine, Kirkland Lake or Gowganda will certainly acknowledge that the work of the geological department of the Ontario Bureau of Mines has great economic value. The reports and maps by Miller, Knight, Burrows and Hopkins have been especially useful.

But there seems to be no proper realization of the magnitude of the mining industry which could be built up in Ontario. We are making progress, but is far too slow. We are not organized on a scale which comes anywhere near approaching that which is needed. The geological mapping of promising mineral areas in this province; preliminary mapping of new areas and more detailed study and mapping of areas that are being developed, is proceeding at a pace which would indicate that the Government is too easily satisfied. The record of what has been done is a good one; but in our opinion it is only an indication of what might be done. Possibly, if the past record were not so good it would be easier to direct attention to the possibilities ahead.

When it is realized that our progress is far too slow, that it does not measure up to the possibilities for mining development in Ontario, it will be found difficult to suddenly enlarge the scale of operations. Geologists capable of doing really useful work for prospectors in Ontario are not made in a day or a year. Even should the Government realize the necessity for speeding up the geological work, it will be found not easy to do so, owing to lack of suitably trained and experienced men.

This brings us to another matter, that of remuneration for geologists engaged by governments. There has been too much made of the honor, glory or "kudos", that accrues to scientifically trained workers for their contributions. The contributions would be just as good, and probably better, if the workers were properly paid. The industry is suffering from a failure to realize that the geological mapping is not proceeding at a proper pace, that there are too few workers, and that we are unlikely to have enough until this department of the industry is organized on a proper basis. It has been the fashion to get geological work done by bestowing praise. Only a limited number of men can be fooled in that way for a long time. The praise may be sincere, and there is often no realization of the way in which acceptance of praise instead of pay for work done reacts on the industry and delays development of our mineral resources.

The professor who tries to impress his students with the great value of a "halo" for scientific work accomplished is sometimes unwittingly delaying development. Geologists trained in our universities remain for a varying length of time under the influence of the "glory" doctrine. Our objection to the doctrine is that it delays development of mineral resources. The work of our Ontario geologists would be more useful if their salaries were doubled and they were given each several assistants at their present salaries, so that they might train up a body of men who would be able to do the required work on a scale that would be more in keeping with the natural wealth of the country. The purpose of mining is to add to the wealth of the community, and money expended in geological mapping would bring big profits.

There has been much talk lately of the failure of the public to realize the value of the work of technical men. There is good reason for such complaint, but so far as those who are engaged in mining are concerned, and we can speak of geologists in particular, the public is not so much at fault as the technical men themselves. The geologists have been buncoed. They have been handicapped by the fact that there has been confusion be-

tween geological work done solely to satisfy a thirst for knowledge, sometimes called "pure" science, and geological work done to gain information that will have a money value in the development of ore deposits. It is not surprising that those who wish to attract students away from industry should endeavor to surround such work with a halo in order to make it attractive. But those whose work is in the industry, those who are applying science to industry in order that they and the whole community will benefit, need no praise from their brother scientists. What they need is a fuller realization of the money value of their work.

We have no desire to belittle the geological work that is done without regard to economic results, for it is not always easy to determine what the actual value of such work will be. But where the purpose of the work is economic there should be compensation in money, not merely in praise. Labor and capital are expended in the mining industry for a definite purpose; to make profits. In order that the industry should grow properly, all those connected with it should have that purpose clearly in mind, and all should see that they share in the profits. If there is any department that is not receiving its share, then that department will lag behind and hold back development of our resources, for it will fail to attract a sufficient number of men who have a clear view of the purpose of their work.

It is generally admitted that development of our mineral resources is greatly to be desired, and there have been pointed out ways in which the government can help to speed up such development. Much of the work must be left to private enterprise; but the geological mapping can well be done by governments, provided that those in charge of such important work are properly paid for their services. A certain number of excellent workers have been kept in the service in spite of inadequate salaries; but the industry is not satisfied with this condition of affairs. If the government is to assume a part of the work in developing our mineral deposits, it should be more strongly impressed with the magnitude of the work to be done and endeavor to get ahead faster. At present, in Ontario, there is a serious endeavor being made by the geological staff of the Bureau of Mines to keep up with the prospector. Mapping is done each season in areas where prospectors are working; but there should be twice as many geologists doing such work, and there should be others of the same calibre mapping areas ahead of the prospector and others doing more detailed work in areas being developed.

COBALT SILVER MINES.

The shipment of nearly $1,000,000 in silver bullion in addition to the large shipments of ore during the month of March from the mines of Cobalt is ample evidence of very satisfactory prosperity in the silver camp. With the largest consignment of bullion ever shipped to the Far East even now on its way to India and the flow of white metal expected to continue, and, with the United States likely to be a purchaser for considerable time to come, there are no visible signs of even the possibility of a recession in the quotations for silver. While work is being carried on at a maximum capacity at the mines of Cobalt, activity is increasing in the Gowganda and Elk Lake fields. Also, more or less interest is once more centering on the Casey-Cobalt area.

EXPANSION OF GOLD MINING IN NORTHERN ONTARIO.

At Porcupine the Hollinger Consolidated is beginning to reap the advantages from expenditures on equipment during former years. The entire 160 stamps are falling. Shareholders who have been denied maximum dividends in recent years should now reap profits in multiplied form. During the last half of the current month the mill of the Dome Mines will again be tuned up, after having lain idle and silent during the stress of war. Indeed life in the entire Porcupine camp is being rejuvenated. The same is true in the Kirkland lake field. The Kirkland Lake mill set in operation two weeks ago is giving satisfaction. The Lake hore mill is operating at full capacity. The Teck-Hughes mill is in operation, and with a reasonably short time the mill of the Tough-Oakes Gold Mines will be re-opened. Before the end of April the construction of the Wright-Hargreaves mill will be in full swing, and by fall at least five mines in the new camp should be producing gold.

ROYALTIES UNDER DOMINION LAWS.

Editor, Canadian Mining Journal:

Sir,—I beg to call your attention to an article which appeared in The Canadian Mining Journal dated the 9th instant, entitled, "Royalties under Dominion Laws," in which you state that the change from a freehold system to a leasehold system, insofar as Federal mining rights are concerned, was made by Order-in-Council, and has stirred the interest of all who were seriously concerned with the future of mining development.

Would you permit me to make a correction in this article? The change to which you refer was not made by Order-in-Council, but by Section 8 of Chapter 27, 4-5 George V., assented to on the 12th day of June, 1914.

This change in the provisions of the Dominion Lands Act rendered it impossible for the Department to frame regulations for the disposal of mineral rights by patent, but by lease only, and from the date upon which this legislation was assented to the form of final title to all mining rights acquired subsequent to that date must necessarily be made to conform to the provisions of this legislative enactment.

Yours, etc.,

H. H. ROWATT,

Ottawa, April 23, 1919. Controller.

Mining Lands and Yukon Branch,

Department of the nIterior.

Ophir.

The ore shoot recently encountered at the Ophir property, although apparently more important than the one discovered a few weeks ago, has pinched out. Further lateral work is proceeding with fair promise of encountering additional shoots and with the hope of some one of these proving of substantial importance.

-:- Encouraging Prospecting -:-

Editor, Canadian Mining Journal:

Sir,—At the recent International Mining Convention which was held in Vancouver on March 17th, 18th and 19th, the British Columbia Government officially presented to the visiting delegates the advantages which that Province offered to the prospector. This was done through the Government engineers in charge of the six mineral survey districts into which the province was divided in 1917. Each engineer, acting on instructions from the Minister of Mines, gave a paper at the Convention dealing with the mineral resources and possibilities of his particular district, suggesting what districts offered the greatest chances for success to the prospector. These papers were all optimistic, in fact very optimistic, and the result of this official advertising cannot but be helpful to the province, not only through attracting prospectors from other provinces and states as well as holding their own prospectors, but by attracting many new men into the prospecting profession, and it is well known that this profession generally holds its members for life.

Manitoba is endeavouring to obtain control from the Federal Government of the natural resources of that province and, if successful, will make a strong bid for prospectors to explore that portion of the great pre-Cambrian Shield which is within her boundaries. The wonderful success attained by the few prospectors in that district in the past augurs well for the future and if, as suggested, the Manitoba Government encourages the opening up of that district by means of railroads, by subsidizing smelters, and even by "grubstaking" prospectors, we may expect many a northern Ontario pioneer to transfer his activities to the neighbouring province.

Several exploratory parties are to explore parts of the hinterland of Quebec this summer and the Dominion of Newfoundland has already taken more than one well-known explorer from northern Ontario.

The Province of Ontario is at present short of prospectors. Even before the war the number was decreasing. During the war many enlisted. A considerable number of these men have either made the supreme sacrifice or have returned physically unfit to continue their work in the bush.

The discovery of a new camp of sufficient importance to cause boom conditions for a couple of years would solve the problem, as many new men would be attracted to the game, but the probabilities of discovering a new camp are lessened by the very fact we are considering—the lack of prospectors. The necessity of the Province of Ontario holding the few prospectors it has against the inducements offered by other provinces, and the equal necessity of adding to this number must appeal to every person interested in the future of the mining industry in this province. It is unfair to point to the advancement made by this province during the past fifteen years and argue from that, that the future of the industry is assured without adopting any definite scheme for encouraging prospecting. It must be remembered that it was the discovery of Cobalt by the accident of railway location which gave Ontario a new industrial class, the prospectors. Before that there were a few prospectors in Sudbury, in western Ontario and in Hastings county, but the number was very few. As against the argument of *laissez faire*, it should further be remembered that Ontario before 1903 as the richest and the most thickly populated and the most developed of any of the provinces of the Dominion, and yet it was practically unrecognized as a mineral province. The industry of prospecting, developed by the accidental discovery of Cobalt, directly resulted in the discovery of other silver areas and of the enormous gold area to the north.

The prospector is the first esential to the discovery of the mineral resources of a district such as northern Ontario, and yet, after the discoveries are made, it is not the prospector as a rule who reaps the greatest benefit from the development of these mineral resources. It is true that in many instances in the north the prospector made a fortune, but even in these cases the prospector did not desert the country. He either became an operator, or he used part of his money in grubstaking other prospects. But those people who reaped the greatest benefit form the rich mineral resources of northern Ontario, that is those who received dividends, do not as a class expend any appreciable amount of their profits in attempting to discover other mineral bodies to replace the ones the exhaustion of which is paying them large returns on the monies invested. Many of these people did not even participate in the gamble or developing the prospect. They bought it when the future of the property was assured. Would it not be fair to ask these people, in return for the profit they reap from the exploitation of the mineral resources of the province, that they expend a small proportion of these profits in prospecting for other valuable ore bodies the discovery of which would enormously increase their profits. A manufacturing industry does not hesitate to use part of its profits in seeing new fields. Many mining companies are anxious to develop new properties, but if we have not the prospectors, we cannot have the prospects to develop.

I would suggest that every mining company should use a small portion of its profits, say 2 per cent, in prospecting. During the past 15 years the mines of Ontario have paid not less than $130,000,000 in dividends. The proportion of this I have mentioned would amount to $2,600,000, or sufficient to have kept an army of between 250 and 300 prospectors in the field every year during the past 15 years. The mining companies are in a better position than anyone else to undertake and supervise this work. They have their own engineers acquainted with conditions in northern Ontario. These engineers would be able to intelligently direct what districts their prospectors should work in, and would decide whether any discoveries made were worthy of exploration. If encouraging locations were made, no time would be lost in seeking capital, or in arranging terms of purchase and any development work done would be done intelligently with a view to finding out as quickly as possible the value of the property and not with the idea of sale. Further, the company's engineer would know when to quit, and money would not be needlessly wasted. Such a scheme would almost certainly meet with success in a proportion of cases and would prolong the life of the company. The pro-

spector would require to be given an interest to ensure his best efforts and, during the winter months, would no doubt be employed in some capacity at the mine. I do not think the shareholders would object to such a requirement. The tax would be levied only on paying companies; it would not be a burdensome tax; the money would be expended in the interests of the company and would be spent by the company's own officials.

In addition, and to round out such a scheme, there should be aid on the part of the Government. This aid should follow the policy at present pursued by the Government, in mapping geologically, ahead of the prospector if possible, and in trails and roads, the free identification of minerals, the throwing open of any districts withheld from surveying, and making the Mining Act as flexible as possible. The last would necessitate the removal from the statutes of the obnoxious and foolish "discovery" clause. In addition, I think the Government should start night classe for prospectors in centres like Sudbury, Haileybury and Timmins. In Sudbury and Haileybury these classes could be in connection with the mining schools at these towns, utilizing the mining teachers already on the staff. Mineral collections containing all Ontario ores and minerals liable to be found in Ontario should be at all recording offices and at the night schools. A certain number of free assay coupons, good at the Provincial assay office, should be given with each miner's license. This would not be necessary for the mining company prospectors, but would be of advantage to the independent prospector. Further, a Government testing plant, where small lots of ore would be sampled and purchased by the Government from the prospector, would encourage the prospector to develop his claim.

To summarize, I would suggest the following as one way in which active prospecting could be encouraged in Ontario:

1. The levying of 2 per cent tax on all profits in mining, such money to be expended by the company paying the tax in actual prospecting and under their sole supervision and for their sole profit.
2. Increase geological work by the Government.
3. Government night schools for prospectors.
4. Collection of minerals at all Government recording offices, night schools, and other localities where of advantage to the prospector.
5. Five free assays with each miner's license.
6. Government testing plant, where small lots of ore could be sold.

Yours, etc.,

A. READER.

Toronto, April 24, 1919.

GOVERNMENT PROSPECTORS.

The Great War Veterans' Association, Winnipeg branch, has had before it, proposals concerning the development of Canada's mineral resources. The following resolution was passed a few weeks ago:

WHEREAS it is essential in the interests of Canada and of the returned soldiers that the natural resources of this country be determined and developed as quickly as possible;

AND WHEREAS during the last forty years the work done by the Geological department is infinitessimal compared to what remains to be done with regard to the determination with a view of development of said resources;

AND WHEREAS it is considered that four or five hundred trained parties each under the direction of a competent mineralogist could with great advantage be sent out to examine different sections of the country each summer, particularly that portion of the Dominion lying between the Great Lakes and the MacKenzie River, and that all necessary instruction and training could be given to these parties during the winter;

NOW THEREFORE BE IT RESOLVED by this, The Great War Veterans' Association of Canada (Winnipeg Branch) that the Federal Authorities be requested to take up this matter as quickly as possible with a view to tabulating the mineral and other resources of the unexplored parts of this country in the shortest possible time and to training the necessary number of returned soldiers (say from 10,000 to 12,000) without delay, provision also being made to see that those discovering valuable resources obtain a fair share of the profits by way of royalty or otherwise in addition to such salaries as they shall receive as Government Prospectors.

Lake Shore.

During the month of March, according to official figures to your correspondent, the Lake Shore Mine produced $45,364.46. This is the highest month's record in the company's history. Mill heads continue to average between $24 and $25 to the ton. The mill treated an average of a fraction under sixty tons daily for the period. Satisfactory progress was made underground.

Porcupine Towns Growing.

At last it has been definitely stated that the mill of the Dome Mines will be set in operation on a moderate scale during the last half of the current month, and that from then on operations will be rapidly speeded up. This official announcement followed a meeting of the directors held early in the week, in New York, at which time three new directors were added to the Board.

At the present time the number of mine workers engaged in the Porcupine field exceeds the total number engaged at the mines of Cobalt. This number will be still further increased by perhaps fifty per cent. during the next few months. As a result of this, the camp is booming. Housing capacity is not only taxed to the utmost, but is quite inadequate to meet the great and growing requirements, and an extensive building program appears to be imperative. Real estate, as well as interest in mining is rising rapidly. Instances on record show an increase in shares of mining companies some times amounting to two and three hundred per cent. The same is true of real estate.

B. C. Resources.

British Columbia,(Mr. Casey believes, has the greatest natural resources in the world, and the fact that they have hardly been touched is surprising. He is much impressed at the extent of water power to be had as well as minerals. The wonderful prairies with their productiveness, east of the mountains and the great harbors, he believes Vancouver is the natural doorway to the east and that there is evidence of a great prosperity and development close at hand.

The B. C. climate is superb and none better anywhere.

Mining Taxation in British Columbia

A review of the taxation legislation, passed at the session of the British Columbia Legislature just prorogued, shows that no important changes have been made insofar as the mining industry is concerned. The most noteworthy alteration is an amendment which brings the coal mining companies under either the Royalty tax of 10 cents a ton on all coal produced or the Income Tax Assessment, the Government having the power to select whichever will yield the greater revenue. Coal used in the manufacture of coke is not taxed until it becomes coke, when it is assessed 10 cents a ton. Two other amendments passed have to do with the regulations to govern assessors in arriving at what is known as "Taxable Income." One of these provides that "income derived by non-residents from interest on loans, salaries or directors' fees where these have been otherwise assessed with the Province," shall be exempt, and the other specifically states that no deduction shall be permitted for depletion or exhaustion of a mine.

The amendment relating to the collieries is noteworthy as indicating that the Provincial Government does not intend, as was suggested, increasing the 10 cent a ton tax to 25 cents a ton. Those referring to the Income Tax are worthy of special attention only because they make clear that there is no present intention to meet the wishes of some of the large metalliferous mining companies of the Province, the chief of which are that the income tax should allow the deduction of interest on capital borrowed from outside for the development and operation of the property, in other words, that taxation should be based on net and not on gross income, and that there should be further deductions for depreciation and for exhaustion of mine, etc.

The taxation problem is a serious one in British Columbia, as in fact it is throughout Canada at the present time. The Government two years ago announced its intention to attempt to revise, refine, and put on a more scientific basis its method of deriving revenue. With this end in view Prof. Robert Murray Haig, Ph.D., Assistant Professor of Economics at Columbia University, was appointed to make a special investigation of conditions and to offer suggestions for total improvement. A Taxation Board also was named to conduct thorough and detailed research work in conjunction with Prof. Haig to the end that a comprehensive measure might be prepared for the consideration and guidance of the Government. The Taxation Board's report, with which was coupled that of Prof. Haig, was laid before the House during the last Session, and some of its comments and recommendations in regard to the mining industry are of interest.

The Taxation Board submits what are termed its first and second reports, and in its former deals with mining as follows:

Re Allowing for Exhaustion of Mines.

"This Board, after hearing the evidence submitted and the pleas made to support the proposal that such an allowance be made, cannot recommend that any such allowance should be made before income-tax is levied on net profits; for these reasons:—

"There is no law we have found providing for such in any country whose laws we have inquired into where the taxation on mines is a tax levied on the net income therefrom, and in England the decisions of the Courts are clearly against it. It is safe to assume that before capitalists invest money in a mine they will know with a great degree of certainty the value of the ore-deposit therein, or, rather, they will have some proof that there is enough ore to justify the venture, and will believe that in the operation of producing and selling the product of the mine they will be able to make enough profits to pay interest on the capital invested and create a sinking fund to replace the capital invested before the mine is exhausted.

"They will be guided by the same principle by which a teamster is guided when he buys a horse, who expects to make enough profits from its use as will pay for feeding it and pay for another to take its place when it dies or is no longer able to do its work.

Re the Mineral Tax on the Value of the Ore, 2 Per Cent.

"The Board recommends the continuance of this tax, as it is levied in substitution for all taxes which might be levied upon the land from which the ore or mineral is taken, a tax on the estimated value of the ore in the ground, and for the personal property used in the working of such mines.

"The great efforts that have been made to show that to levy this tax and to tax the profits made in the undertaking is dual taxation must fail under a proper analysis of their relation.

"The mineral-tax is imposed on the party who is given possession of the mine, by licence or otherwise, and because he has been given control of it as against any one else in the community and secured by law in that control, and has no relation whatever to the principal or the basis of a tax on net income.

"It is levied on the same principle on which a farmer is taxed for the privilege given him by the community for the exclusive use of his farm, and for the benefits that he receives from the community in the enjoyment of that use, and has no connection whatever with the tax levied on the profits he makes out of the community by the exercise of his energies applied to that farm. And the tax that is levied on farmers' profits is no greater in proportion than the tax levied on other taxpayers who have no privilege or licence to use any part of the domain of the country.

Re Allowing Interest on Capital Invested by a Company in a Venture to be Deducted from Profits before Income Tax is Levied Thereon.

"This Board submits such should not be allowed. First, it is the amount of the net profits made by a company or individual which is the measure of the value of the opportunity given by the community to make such profits. This is the basis for and, indeed, proof of the fairness of a tax on net income.

"And seeing that there is no fixed relation between the amount of capital invested and the amount of

profit derived from the investment, it would work out unfairly to allow such deduction. It may happen — and, in fact, very often does happen—that a company investing half the amount of capital that another company invests will make as much profits from their venture as the other does.

"In support of this recommendation, that interest should not be allowed on capital invested by a corporation, we quote the following from Professor Seligman. He says:—

'In England, the income tax payable on annual profits or gains, according to Schedule D of the income-tax, is advanced by the corporation, and is deducted by it from the dividends on interest due the security-holders, who are then to that extent exempt from the income tax.'

"He says further, 'Taxation of interest on corporate debt is not double taxation, because the coupons, like the dividends, are integral parts of the income; because both bonds and stock together form what is really the working capital from which the income is derived.'

"There is therefore the best authority for not allowing the deduction of interest on borrowed capital before income tax is levied, and this principle will hold, with equal force, against allowing any rate of interest on invested capital being set aside before income tax is levied on net profits.'

Taxation of Coal Mines.

In the Board's second report the submit of taxation of coal mines and the mining industry generally is commented on as subjoined:

"In the draft Act submitted herewith we have provided that the taxation of coal mines be changed to bring the owners thereof under the income tax provisions of the Act. We have done this for the reason, as we believe, that the present system is most unfair as between the owners of the different mines in that it takes, like the old tithe system, a fixed portion of the product without any consideration of the relative cost of production as between one taxpayer and another. The measure of this injustice will be found by comparing the cost per ton of getting coal to the point of delivery for sale from the mine from which coal can be produced the cheapest, with the cost per ton of getting the coal to market from other mines whose output is produced under less favorable circumstances. The inequality in the incidence of taxation under the present Act no doubt discourages the working of mines that afford but a small margin of profit, and militates against the opening of new mines, which in the early days of development are unduly burdened by this method of taxation.

"We have placed the value of coal lands, as such, for assessment at the price at which they can be bought from the Government—namely, $15 per acre. There is no practicable way by which an assessor can determine the value of coal land as such, nor does the value of the surface give any index to that value. Therefore, to place these lands at an equal value for coal-mining purposes is probably as fair a way as can only be discovered by mining the coal. Although the relative value arising from difference of location might be considered as a reason for differentiation in assessed value, yet as this will be reflected in income and compensated for in the equalizing result of net income tax, it need not be considered as important.

"In providing for the taxation of mines other than coal mines, we have followed the lines indicated in our former report; that is, to place in addition to a tax on the net income from the mine an initial tax on the net value of the ore in substitution for all the other taxes that might be levied—namely, a tax on the value of the surface of the land for the purpose for which it is used, a tax on the estimated value of the ore in the mine, and a tax on all the buildings, plants ore in the mine, and a tax on all the buildings, plant and machinery used in or about the mine in connection with its operation. We have left out the alternative given to the Government by the present Act, to take a tax on the product of the mine or a tax on the income from it, whichever is found to be the greater. We submit that this method is wrong in principle and that it should not be followed, as it places an unequal burden on mine-owners in the comparative advantage to the mine with the richest ore and other favorable conditions as compared with other mines not equally favored.

"To put a fixed percentage tax on the net value of ore which costs 20 per cent. of its value to get it, and the same fixed percentage on the net value of ore which costs 80 per cent. of its value to get it, is so clearly inequitable that it has only to be stated to be condemned. Although the principle so condemned is applied in the draft Act submitted, its application to the extent provided finds justification in the fact that the tax so levied by it is in substitution for all the other taxes that might be levied, as above stated, as a real property tax, and for the further reason that in the case of a struggling mine during the early stages of development it may be much less than those taxes would be for which it is substituted.

"In the United States there is probably no subject of taxation which has aroused so much difference of opinion and controversy as the taxation of mines. This has arisen largely from the rigidity of the constitution of nearly all the different States, constitutions which crystallized into law the experience of a period when tangible property was taken as the sole evidence of the ability to pay taxes. The economic changes that have taken place since that time have created new conditions in which tangible property is not only incomplete evidence, but very misleading evidence as to where the "power to pay" is to be found. There is, therefore, in that country great effort being made to change this principle in taxation, and in many of the States some modifications have been made in that basic law. Yet few of them have got quite free from that die-hard notion that all things having a sale value should be taxed on that value irrespective of their nature or use—not yet realizing that it is not the thing or means used in the production of wealth that should be taxed, but that it is the wealth produced that should be made bear the burden of taxation, as that is the only thing that gives the "power to pay."

"Hence we find two impossible things attempted by assessors there—one to value ore in the ground, the other to find out the amount of capital invested in some undertakings. The latter impossibility is stranger than the first, which arises from two causes—one of which is its amazing shrinkage if it is to be made the base of taxation, the other being its wonderful expansion if the interest thereon is allowed to be deducted before the income arising therefrom is charged with income tax. The members of this board have reason to think that no country in the world gives mine-owners

a safer method of taxation than the one submitted herewith, for it practically imposes no taxes on them until their mine reach a productive stage."

Prof. Haig's Comments.

Prof. Haig's comments on various phases of mining taxation are not altogether in harmony with those of the Board, and are appended:

Coal Lands.—"Coal lands are placed in a separate category for purposes of taxation. They are defined as all lands "owned, leased, held under licence, claimed, or occupied by any person for the special purpose of mining coal therefrom, and which is not held or used for any other purpose." These lands are subdivided into two classes. Lands in Class A, which include the lands which are being actively mined, pay the same tax ratio as improved agricultural real estate, 1 per cent. Class B lands, consisting of unworked coal lands, are taxed at a 4 per cent. rate (until 1917, 2 per cent..

"The distinction between the active and inactive coal lands rests on the same theoretical foundation as the distinction between improved and wild land. It is, of course, directly contrary to the fundamental theory of the income-tax. In any reformulation of policy which is attempted with respect to wild lands, coal lands should be included in the consideration.

"The tax on coal land is not of great fiscal importance, the total levies for years past, as set forth in Table VIII., having been in the neighborhood of $50,000 annually. The increase in the rate on Class B land in 1917 causes a substantial increase in the levy. But, if the absence of formal complaint before the Taxation Board be of any significance, the higher rate has not caused great dissatisfaction. Certainly the burden added to the coal-mining interests is in no sense comparable to that added to metalliferous-mining interests by the legislation of 1917.

Table VIII.—Levies on Coal Lands, 1909-17.

Year.	Class A. (Active.)	Class B. (Inactive.)	Total.
1909	$15,234	$ 5,459	$20,694
1910	17,367	5,004	22,371
1911	19,787	22,920	42,708
1912	20,651	23,651	44,303
1913	16,443	34,058	50,502
1914	22,696	33,444	56,140
1915	21,930	37,264	59,195
1916	20,093	36,400	56,493
1917	21,038	74,432	95,470

Allowances of Deduction for Depreciation and Depletion.—"The provisions of the present law make it impossible to deduct depreciation and depletion allowances from gross income in arriving at "taxable income.' This situation does violence to business customs and good accounting practice, and is the cause of much bitter resentment, particularly among the large taxpayers. Depreciation is a very important item in many industries, and, moreover, it varies greatly from business to business. Consequently not only does the taxpayer consider himself taxed on an item of prime cost as though it were a profit, but he also, quite properly, feels himself at a disadvantage as compared with his neighbor whose capital is of a nature which depreciates less rapidly than his own. It is the prevailing practice generally where income taxes are levied to allow reasonable deductions for depreciation, and it is strongly recommended that the law be so amended as to permit such deductions in British Columbia. Allowances for depreciation should never be permitted to exceed the amounts charged for such purposes in the accounts of the enterprise. Repairs, narrowly defined, should be deductible in addition to depreciation, but renewals and replacements are properly covered by depreciation itself.

"Obsolesence is one of the elements in depreciation, but practice varies in regard to allowing it as a deduction in determining income for purposes of taxation. The Wisconsin law expressly forbids such deductions. The United States Federal law permits them, and the language of the new Dominion law is evidently sufficiently broad to allow them at the discretion of the Minister of Finance. In case they are allowed, the deduction should be restricted to the obsolescence which actually accrues. Obsolescence cannot be anticipated with a degree of certainty necessary to make it a proper deduction before its actual occurrence.

"As would be expected where mining forms so large a part of the economic activity of the Province, there is dissatisfaction because of the fact that no deductions are permitted on account of depletion. If the income-tax is to be a tax on true net income, such allowances should certainly be made. This coincides with the prevailing practice in American income tax laws. Depletion is specifically provided for in the new Dominion law, and in the Wisconsin income tax law. Formerly it was permitted only in part by the United States Federal law, but recent changes make possible full deductions.

"In allowing for depletion, the total deduction should never exceed the actual cost in cash of the ores and deposits. If this rule is applied, mistakes in the direction of too great or too small allowances for depletion tend to eliminate themselves. Thus, if depletion is claimed at too heavy a rate, the taxable income in later years would be increased, whereas if the rate of depletion is made too light it can be increased and the tax correspondingly lightened when this becomes apparent.

"Only two points can be advanced in defence of the present practice of refusing deductions for depreciation and depletion. One is that the Province cannot afford to give up the revenue which it would lose if allowances for these purposes were permitted. The other is that it is impossible to construct a satisfactory plan for the determination of the amounts to be allowed as deductions for such purposes. In regard to the first point, it may be confidently asserted that it would be better, in the case of depreciation at least, for the Province to advance rates on the new base to a height sufficient to make up for the loss in revenues. The second point, considered in the following section, is more serious.

Allowance of Deductions for Interest on Borrowed Money.—"At the present time the law forbids the deduction of 'any interest on borrowed capital from which an income is derived, if such interest is paid to a lender who is not a resident of the Province, or to a company as lenders, which company does not transact business in the Province, and which does not pay taxes thereon in the Province.'

"Whether deductions should be permitted for interest paid on money borrowed from non-residents in this particular situation is a question concerning which much can be said on both sides. Fundamentally it involves the whole theory of situs in income taxa-

tion. It may be urged with some appearance of justice that the authority in whose jurisdiction the income is earned should have first claim upon it for purposes of taxation. But British Columbia does not accept this particular theory of situs in a rigorously logical fashion, for no allowance is made for deductions in the case of citizens of British Columbia who have invested their capital abroad. From the point of view of the business, no distinction between resident and non-resident capital can be justfied. As the business-man views the situation, he is permitted to borrow locally without penalty, but can borrow abroad only upon condition that he pay the Province (in some cases) 10 per cent. of the interest. This seems to him to be anything but taxation according to ability to pay. Moreover, when there is such a dearth of local capital it appears to be a direct discouragement to capital seeking investment within the Province.

"However, there is a serious, practical question involved because of the manner in which many of the large undertakings in British Columbia are financed. For often the securities are os arranged that practically all of the money invested is represented by bonds, the true owners of the business appearing as creditors with their money loaned to the concern rather than as investors owning directly their equities. Under such conditions the deduction of interest charges in determining taxable income would convert the income-tax into an excess-profits tax. This would mean added variability in revenues and higher rates if the same yield was to be secured. A combination of a heavier property tax with such an excess profits tax offers interesting possibilities. At the present time, however, it is the opinion of the investigator that the allowance of deductions for interest on outside capital, important though it be, is not so urgent a matter as are some of the other changes, such, for example, as deductions for depreciation. If it can be afforded, it might be well to introduce it with a limitation upon the amount, somewhat after the fashion of the United States Federal income tax law, which permits deductions for interest on indebtedness "to an amount of such indebtedness not in excess of" the capital o fthe company and one-half of its interest-bearing indebtedness. The Wisconsin law, which formerly restricted deductions for interest in a fashion very similar to the Federal law, has recently been changed so as to permit full deduction. Such limitations are open to serious criticism. There is no logical stopping-point between any allowance at all and complete deduction of interest. Moreover, limitaions of this kind have an unfortunate tendency to encourage excessive capitalization. They can only be defended on practical grounds of fiscal necessity.

Allowance of Deductions for certain Fees and Salaries.—"The law at present forbids deductions 'for directors'. fees, and for salaries of persons holding offices as directors, and for the salary paid the president, vice-president, and general manager of any company or body corporate.' The only excuse for such a provision is that, in its absence, the practice would prevail of distributing dividends through the device of inordinately high salaries and fees. A less crude method of preventing such practices is to vest some body with authority to pass upon the reasonableness of fees and salaries. The distinction suggested between resident and non-resident officers is one which is not easy to defend. If a permanent Tax Board is established, the control of these deductions should be made one of its functions.

Taxes Levied on the Royalty Basis.

The Mineral Tax.—"This is a levy of 2 per cent. upon the assessed value of all ore taken from metalliferous mines. The assessed value accepted for the purposes of the Act is the 'smelter return,' defined as the gross value after deducting 'the cost of transporting the said ore and mineral substances to the smelter or mill and the cost of treating the same.'

"As explained, the specific tax was formerly in substitution for income taxes, but this was changed in 1917, and the income tax now applies both to the corporation and to the dividends of such companies forming a part of the taxable income of stockholders.

"The Provincial receipts from the mineral tax for a series of years is shown in Table XI. The largest sum ever received, nearly $300,000, was realized from this source in 1917. This is more than twice the yield of 1915, and three times the yield of 1911. Such excessive variability is a shortcoming of this type of levy. In this particular situation the great increase comes, oddly enough, when revenues from other sources are declining. The explanation is, of course, the abnormal demand for metals due to the war.

Table XI.—Receipts from the Mineral Tax, 1905 and 1910-17.

Year ending—	
June 30th, 1905	$114,236
March 31st, 1910	102,608
March 31st, 1911	91,038
March 31st, 1912	100,659
March 31st, 1913	155,163
March 31st, 1914	153,880
March 31st, 1915	130,876
March 31st, 1916	163,335
March 31st, 1917	287,257

The Coal and Coke Tar.—"Coal-mine owners pay the Provincial Treasury a royalty of 10 cents per ton on all coal produced, except on coal shipped to coke-ovens in the Province. Owners of coke-ovens pay a tax of 10 cents per ton upon all coke produced. Several years ago the rate upon coke was 15 cents. The equal rate per ton on coal and coke is defended by coalmen on the ground that the difference in the quality of the coal used for coking purposes makes up the difference between the weight of a ton of coke, and the weight of the coal entering into it.

"The receipts from this tax, shown in Table XII., exhibit considerable variability. Less money was received from this source in 1917 than in 1910. The yield in 1913 was 50 per cent. larger than four years later, in 1917, but a part of this difference is explained by the change in rates.

Table XII.—Receipts from Coal and Coke Tax, 1905 and 1910-17.

Year ending—	
June 30th, 1905	$ 94,682
March 31st, 1910	222,722
March 31st, 1911	248,332
March 31st, 1912	195,207
March 31st, 1913	302,225
March 31st,1 914	192,590
March 31st, 1915	158,867
March 31st, 1916	173,261
March 31st, 1917	194,536

Tax on Unworked Crown-granted Mineral Claims.—"A special penalty of 25 cents per acre is imposed on mining property held by Crown grant and not

worked. The tax is of long standing and apparently provokes no opposition. In its nature it is similar to the tax on wild lands and on unworked coal land, and what has been said of the theory of these taxes applies here as well.

"The receipts from this tax, shown in Table XIV., are remarkably constant quantities, but are not important in size.

Table XIV.—Receipts from the Tax on Unworked Crown-granted Mineral Claims, 1905 and 1910-17.

June 30th, 1905	$39,869

March 31st, 1916	35,703
March 31st, 1917	37,903

That Prof. Haig is of the opinion that metalliferous mining is getting somewhat the worst of it under the present system is indicated by one of his concluding references to the situation generally with respect to mining taxation in this province. He says:

"To make comparisons it is necessary to reduce the elements to some common basis. Where a single tax is applied uniformly comparisons are readily made. But under the British Columbia tax law almost every interest is taxed upon a different basis and at a different rate. The assessment and tax data yield almost no information for drawing conclusions as to relative burdens. An inquirer who would know whether the coal-mining industry is heavily taxed as compared with the metal-mining industry must combine the various miscellaneous charges resting on each, and compare them with data regarding the economic strength of the industries gathered from some other source than the tax records. But it is difficult to escape the conclusion that coal-mines taxed merely on the royalty basis are equitably treated as compared with metalliferous mines, which, in addition to royalties, pay taxes on income and dividends. And it is not easy to see the equity in increasing 50 per cent. the taxes on Crown-granted timber lands when the charges are not increased upon timber companies drawing their supply from other sources than Crown-granted lands."

BEAVER CONSOLIDATED MINES.

At the annual meeting of the Beaver Consolidated Mines Company, held in Toronto, April 16, at which there was a fair representation of shareholders, it was announced by the President, Mr. F. L. Culver, who presided, that the Kirkland Lake mill, which is now in operation, will exceed its capacity of 150 tons. The underground work is progressinb favorably, and rich ore is being encountered at the 700 ft. level. On the Beaver property, development work has ben renewed at 1,400 feet. A new vein has been struck, that looks very promising. The directors of the Beaver Consolidated has just this week returned from the north, and were in a position to report first hand knowledge of the work on the company's joint properties, the Kirkland Lake gold mines and the Beaver silver mines.

A new director was appointed to take the place of Mr. J. H. Black, who has resigned, in the person of Mr. F. B. Mercer. The shareholders also passed a vote of thanks to the directors for the manner in which they have looked after the affairs of the company in the past year.

FAVORABLE DEVELOPMENTS AT NIPISSING MINES.

In his regular monthly report, manager Hugh Park, in reporting to the president and directors of the Nipissing Mining Company, says:—

During the month of March the company mined ore of an estimated net value of $261,158, and shipped bullion from Nipissing and custom ores of an estimated net value of $814,952. Favorable underground developments were met with at several shafts and general operations everywhere continued satisfactory. At shaft 73 drifting is progressing on vein 544. The depth of this new level is 548 feet below the collar of the main shaft. No high assays have been found to date, but the vein is strong and well defined, except where disturbed by numerous faults.

Particularly favorable developments are taking place at 96 tunnel. The new veins are being developed, one by winze and one by drifting. The vein being drifted on is one two inches wide and has been assaying several thousand ounces. Fifty feet of drifting has been done to date and the face of the drift shows two inches of high grade solid ore. Two small mud seams with fai rassays in the country rock, have lately been found at the 120-foot level of shaft 128. This is the new shaft recently completed and which will explore the western area of R. L. 401 at the north end of the lake.

The high grade ore treated amounted to 208 tons. The refinery shipped 55,108 pounds of bullion which contained 802,698 fine ounces. The low grade mill treated 6,962 tons. The following is an estimate for the month of March:—

Low grade mill	$162,946
Washing Plant	98,212
Total	$261,158

DOME HAS THREE NEW DIRECTORS.

It is the intention of the management of the Dome Mines, Limited, to have the mill running on a moderate scale in the latter part of April. From then on mill operations will be rapidly built up to a 600-ton daily basis. Such is the announcement, following the meeting of the directors in New York this week, made by a Toronto director, who was present.

It is believed that the annual financial statement of the company, which is being prepared, will show a surplus of current assets over current liabilities amounting to $489,000. It is stated also that the Dome Mines, which took an option on the Dome Extension property some time ago, is developing the mine from the sixth level, from which a cross-cut has been driven into the Extension property, where an ore zone was entered showing an average grade of $4 to the ton.

Three new directors were added to the board — namely, Mr. Colgate Hoyt, New York; T. R. Finucane, Rochester, and C. D. Keading, Porcupine. It is understood that the Board of Directors will be increased to nine members, and that Mr. Pouillon, of New York, will be the ninth member.

Wright-Hargreaves.

The construction of the mill, beginning with extensive excavations, will be in full swing at the Wright-Hargreaves mines by May 1st. The mill is designed to treat at least 200 tons daily, and will be the largest so far installed in the Kirkland Lake field.

THE ROAD TO KIRKLAND LAKE.

Interests representing some of the leading mines of the Kirkland Lake district are presenting evidence to the Ontario Government, showing the advantages and disadvantages of a steam railway, the disadvantages of an electric railway, as well as the advantages and disadvantages of a first class motor road. It will perhaps be a surprise to many to learn that these leading interests are not in favor of a steam railway, but appear to believe a first class motor road would best fill the requirements of the district.

A summary of the situation, viewed from various angles, is given herewith. It represents the opinion of a leading operator in the Kirkland Lake field, and is being submitted to those most vitally interested, asking for expressions of opinion. The summary follows:

As you are probably aware the Government has authorized the construction of a branch line of the T. & N. O. Railway from Swastika to Kirkland Lake at an estimated cost of $155,000, the route selected being that through the Elliott-Kirkland, across the narrows of Kirkland Lake to a point near the Wright-Hargreaves office and thence across the Sylvanite towards the Tough-Oakes mill.

As you are no doubt much interested in this important question of transportation and after consultation with a number of men who have considered the question in all its bearings, I venture to submit some facts, figures and estimates which I have collected, as the result of enquiries on the spot, and from data supplied by Mr. Clement, the Chief Engineer, and Mr. A. A. Cole of the T. & N. O. Railway with a view to asking you to give an immediate expression of your opinion upon the question as to how the needs of the community can best be met in this matter of transportation.

There were originally three obvious solutions for consideration, viz:—

1. A trolley road, which would appear to meet practically all requirements and give a fairly frequent and flexible service.

This has been ruled out on the score of cost, the estimated capital outlay involved being approximately $266,000, with the necessary transformer sub-station and equipment.

2. A steam railroad as outlined above, which has now been authorized.
3. A first class motor road capable of withstanding heavy motor trucks, and costing about $72,000, which does not appear to have received much consideration.

You are now asked to consider the relative merits and disadvantages of the steam railroad and motor road.

Steam Road Advantages are that it will:

1. Enable freight, including heavy machinery, and passengers to be brought to the mines cheaply, irrespective of weather conditions.
2. Provide for unlimited expansion of traffic in the future.
3. Cut freight rates from Swastika to any point up to Tough-Oakes in all probability to .40c per ton on coal, with proportionately higher rates on other stores and supplies, with an average all round rate of about .60c per ton.
4. Cut passenger fares probably to .25c each way.

The Disadvantages are that it will:—

1. Not enable freight to be delivered direct to the stores or bunkers on more than perhaps one or two properties, and therefore in most cases roads will be required from the railway stations of which there will be but two (one near the Elliott and one on the Wright-Hargreaves at the east end of the lake) to each mine and the townsite and practically all freight will have to be loaded on to wagons and teamed over these roads which have yet to be made, in order to reach its destination at an average estimated cost of .40c per ton at least, thus making the actual average cost of freight $1.00 per ton.
2. Passengers will in nearly all cases have to walk or obtain other means of transportation from the Stations to their destinations—distances varying from a few hundred yards to three-quarters of a mile or more.
3. The present wagon road will fall into almost complete disuse excepting isolated sections which will still be required, and it is unlikely that anyone will be inclined to make and keep in repair.
4. The service will be limited to one train per day each way, probably giving very little time for people to come in, transact business, or look for work, and get out on the same day.
5. The train service will necessarily be slow, with the stops for picking up freight, etc.
6. Consignees will require to have representatives present on the arrival of trains to take delivery or pay for their freight just as they do now at Swastika.
7. The estimated cost of operating and maintaining the branch, aside from interest on capital, amortization or depreciation, is $100 per day which would require say 130 tons @ .60c and 88 passengers @ .25c per day to break even. The average freight handled at present is 36 tons and the average number of passengers about 40 per day, so that it is clear the Railway would operate at a heavy loss amounting to over $20,000 per annum which must ultimately come out of taxes.
8. The right-of-way covers a considerable area of the claim over which it passes and tends to cut such claims in two with its bank or cutting and fences.

Motor Road. Advantages are that it will:—

1. Enable existing road freights to be reduced by means of motor trucks to about $1.00 per ton for the full distance to the Tough-Oakes with proportionately lower rates for the shorter hauls, this being as low as the total cost of delivery with the steam road.
2. Enable passengers to be handled for about .5c per mile in motor busses or less than the steam road could charge.
3. Provide a flexible system of transportation at all necessary hours, delivering freight and passengers to or from their destinations on the various mines or the townsite.
4. Enable individuals to walk, bus or cycle to any point along the field at all times of the day or night, thus permitting men to have fixed homes while moving their place of employment as they require.
5. Permit branch roads to start off at any point to outlying properties instead of only from the two stations on the steam road.
6. Save more than half the first cost of the steam road while providing ample facilities for the present time and the immediate future.

Disadvantages of the motor road are:—

1. In winter snow would have to be ploughed off or the vehicles run on the snow as in most cities in winter.
2. Heavy cost ($12,000 per mile) in order to make a thoroughly permanent water-laid or tar-macadam road.
3. Difficulty in getting a railway built in additon to the road later on unless a further great expansion takes place.

There is every probability that the matter will be settled definitely by the Government within ten days from date and meanwhile if it is considered by those interested in the Kirkland Lake field that a motor road would serve the purpose best **provided.**

(a) That the Government authorized the work immediately under proper supervision and if possible agreed to maintain the road for say ten years — at a cost not exceeding the estimated cost of maintaining a railway road bed, and

(b) That the mines would allow all available waste rock on their dumps to be taken for the work free of cost there is good reason to believe that the Government would readily adopt the latter plan.

Will you, therefore, please answer the following questions:

1. Are you in favor of a steam railway?
2. Are you in favor of a first class motor road, more or less on the line of the old road with modified and improved gradients?
3. If you have any waste rock dumped are you willing to allow it to be used for the road free of charge?

Special Correspondence

Silver Situation Unchanged.

The silver situation remains unchanged with apparently continued heavy demand. Recent predictions by metal authorities in New York that price restrictions might be removed about May 1st, and the price of silver be permitted to find its level on a basis of supply and demand seems to be exceedingly indefinite. Indeed there are various reasons for believing such action will not be taken. In the meantime the mines of Cobalt are experiencing prosperity and, although the removal of price restrictions would be favored locally, and would probably result in quotations moving to higher levels, yet the general feeling appears to be that the matter is an Empire question and one that should be regulated by those at the helm of state, particularly during the present period of reconstruction.

Lightning River.

Interests involved in property in the Lightning River district are appealing to the government for assistance in the building of a road to the centre of activity. For the present $3,000 is being asked, which would be adequate until such time as the merits of the district are further proven.

Kirkland Lake.

Operations are being speeded up in all parts of the Kirkland Lake field. Following the announcement recently that the Ontario Government would construct a branch line of the T. & N. O. Ry. from Swastika to the centre of activity in the Kirkland Lake field, a distance of about six or seven miles, some of the leading mining interests have presented evidence to the government with a view to discouraging the construction of a steam road and building a first class motor road instead. The cost of a first class motor road would be about one-half that of the steam railway, and would provide a flexible system of transportation, making travel possible at any hour of the day or night and would land passenger or freight directly at their or its desination. Compared with this, the steam railway would land passengers at stations and make necessary walks or hauls of from a few hundred yards to three-quarters of a mile or more to the various mines. The full evidence is given in another column, and appears to be very reasonable and overwhelmingly in support of a first class motor road, the cost of which would be $72,000.

Mine Workers Object to Governments Choice of Commissioners.

District 18, United Mine Workers of America, which comprises Eastern British Columbia and the Province of Alberta, is keenly interested in the announcement by Hon. G. D. Robertson, Minister of Labor, that the Industrial Commission, recently appointed to investigate the relationship between Capital and Labor in the Dominion of Canada in order that action may be taken to place it on a basis of better understanding than now exists, will take up the question of the labor situation in the mines of this province at the commence of its duties. The appointment of T. Moore, president of the Trades and Labor Congress, and J. W. Bruce, to the Commission as the representatives of Labor, however, is bitterly opposed by the coal miners. Telegrams have been forwarded from Fernie, B. C., to the Minister of Labor and to Dr. Bonnell, the member of Parliament for the District demanding that these appointments be reconsidered.

"One Big Union" Not Popular.

It will be remembered that at a recent Labor Convention held at Calgary, Alberta, approval was expressed of a proposal that Canadian workmen should organize "One Big Canadian Union," as it has been popularly termed, and withdraw from affiliation with American organizations. The idea, however, is not meeting with unanimous endorsation, however, as is evidenced by the observations of David Rees, international organizer of the United Mines Workers of America. Mr. Rees, who is a coal miner and in close touch with the coal miners' unions of British Columbia and Alberta, and who has been engaged in organization work for some years, says, in part:

"There is no doubt in my mind that the Western Conference held at Calgary should have done the thing that the Conference was called together for, that is: Outline a more progressive policy for the Trades and Labor Congress of Canada. We find that in centres like Toronto, Montreal and other parts of the East the labor people are clamoring for a change. Consequently had the Western Congress outlined their policy we would have hoped to have the Eastern Labor

By WALTER R. SKINNER

The Standard Reference Work on Mines

Price 20/- net

Post Free (Inland), 20/6. Post Free (Abroad), 21/6

1,000 pages. In Demy 8vo, bound in RED Cloth

A Recognized Indispensable Work of Reference
For MINING INVESTORS,
MINING ENGINEERS, MINE MANAGERS,
BANKERS, STOCKBROKERS, SOLICITORS,
or anyone interested in the MINING INDUSTRY

A RECORD OF INFORMATION concerning **1,170** Mining Companies operating in all parts of the world. Gold, Diamond, Silver, Copper, Tin, Iron and other Mines, Collieries, Exploration, and Mining Investment Companies arranged in alphabetical order.

PARTICULARS given of each Company include the Directors and other officials, date of establishment, seat of operations, description of the property, with the purchase consideration, plant erected or in course of erection, present working results, ore reserves, details of capital, calls, dividends paid, and the financial position as disclosed by the latest accounts. Highest and lowest prices of the shares for the last four years, also latest price.

Directors (3,150) and Mining and Consulting **Engineers** and **Mine Managers** (865), their addresses and names of the Companies with which they are connected.

SUPPLEMENTARY INDEX of private, dormant or Companies which have ceased to be of public or market interest. One of the most useful and important features of the book. It is the only list of its kind published.

CRUSHING TABLES and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

DICTIONARY OF MINING TERMS.—An up-to-date glossary covering 440 mining terms by the use of which mining developments can eosily be followed. The difficulty of understanding technical phraseology is thus easily mastered.

To be **obtained** from all Booksellers, or direct from the Publishers.

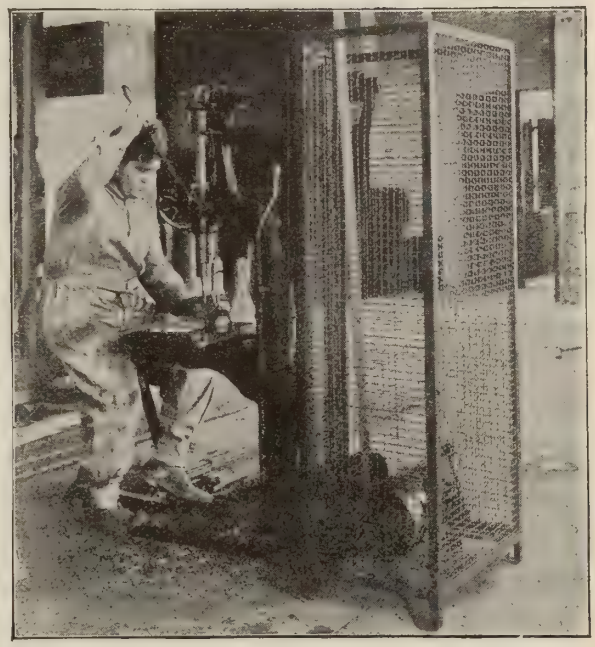
Oxy-Acetylene Welding and Cutting



Used Wherever Machine ry Is In Constant Daily Use

In nearly every line of metal manufacture, from the making of delicate jewelry to massive locomotives, the Prest-O-lite Process of Oxy-Acetylene Welding has firmly established itself. Where two pieces of metal are to be joined, it is supplanting the bolt, rivet and threaded joint in hundreds of factories and repair shops.

Metal lockers, as shown in the illustration, and metal equipment of all kinds can be produced at less cost by this process.

Wherever metal or machinery is produced, moulded, built, shaped or USED, there a Prest-O-Lite outfit will be found of inestimable value.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders, Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange to full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Dolly Varden.

The Provincial Government has nominated Mr. Justice Clement, of the Supreme Court, to act as referee in connection with the dispute between the Dolly Varden Mines Company and the Taylor Engineering Corporation, the points of which were the subject of investigation during the recent session of the Legislature. Judge Clements will go into the whole question of the financial obligations of both concerns and assess costs, etc., in accordance with the terms of the settlement decided upon by the Provincial House.

Title to Coal Lands.

Another phase of the dispute as to the title to coal rights within what is known as the Esquimault and Nanaimo Ry. Belt on Vancouver Island has developed. Does the ownership of coal lying under School, Indian, Naval and other reserves, which were created by the province prior to the grant of the so-called belt to the railway company, lie in the province or the company? It is contended that these coal rights did not pass to the company, although, of course, the latter maintain that they, along with all under-surface rights not specifically mentioned in the Settlement Act, became the property of the railway company under the terms of the said Act. The issue has been before the courts which, in one instance, have upheld the contention of the company. There is considerable valuable coal property at stake in this argument and the province proposes to make an investigation of the matter with a view to the passage of legislation, if it should be found justified, declaring the affected areas to be reserves, thus removing them from the control of the railway company.

The Smelter Rates Enquiry.

From an unofficial but authoritative source it is learned that the Committee of Investigation, engaged on the question of custom charges made by the Consolidated Mining & Smelting Company at its Trail Smeltery, has received very little information or serious formal complaint from shippers of ore to Trail. The Committee, however, has proceeded with its work of investigation at the smelter and has acquired a large amount of definite practical data and has so far digested the material as to justify the engagement of the services of R. O. Whitaker, of Denver, Colo., and an accountant to assist him. With this aid the preparation of the committee's report will be carried on with all possible despatch.

Gold Strike on Morley River.

A gold strike which is attracting much attention is reported on the Morley River, about 150 miles to the northeast of the town of the Skagway and just a few miles south of the international boundary. Morley River runs into Teslin Lake. The surface dirt is said to pay from 30 to 50 cents. Bed rock has not yet been struck. It is expected that there will be a rush to the new diggings with the opening of the summer season.

BRITISH COLUMBIA.

A Road for Aspen Grove.

A road between the town of Princton and the Aspen Grove Mining Camp is to be opened by the Provincial Government this season. It is known as the One Mile Road, and will shorten the distance between the towns of Princeton and Merritt by about 17 miles. Besides it will be of special value to the mining camp named and other similar centres.

Abandoned Claims.

The Mining Committee of the Provincial Legislature during the last session discussed the advisability of recommending the cancellation of all Crown Granted Mineral Claims which have reverted to the Crown through non-payment of taxes. The argument of those favoring the proposal was that by the cancellation of their claims, and the consequent eradication of the surveys from the records, the lands involved would become open for pre-emption by the settler. It was stated that land seekers often found it impossible to make up an even block of suitable agricultural land because of the existence of deserted Crown granted mineral claims. While these contentions were given every consideration, it was felt that no hasty action should be taken, more especially as these old Crown granted mineral lands have made substantial contributions of the public treasury, and, under the existing law, are open to the prospector who may feel that their possibilities have not been properly tested, on exceptionally easy terms.

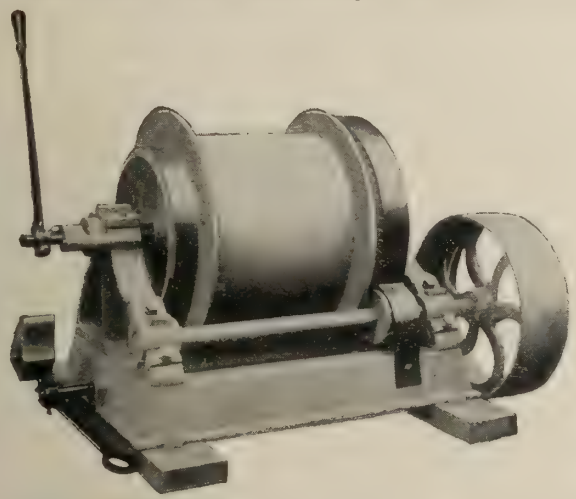
The Peace River Oilfields.

There is no doubt that the Provincial Government's announcement that it proposes prespecting the oil deposits receives the endorsement of the people of this Province, and already there is speculation as to which district it is intended first exploring. As stated before in this correspondence the Peace River Section is generally thought to be the most promising. This is based on the drilling which has been in progress in Northern Alberta for the past ten years, and the results of the same. Within a short distance, comparatively, from the Peace River Country there are a number of small wells from which a certain amount of petroleum may be taken by pumping. Hon. T. D. Pattullo, Minister of Lands, made reference to one of these in addressing the Legislature. That to which he had reference is said to have a productive capacity of 200 barrels per day of a heavy black oil. The same country was drilled by Lord Rhondda, who obtained favorable indications, but found difficulty with salt water under great pressure, preventing drilling to depth. His representatives were strongly of the opinion that below the point reached the prospects would improve. Mr. Charles Camsell, of the Geological Survey Branch, with headquarters at Vancouver, B.C., has for some years expressed the opinion that the Mackenzie River basin would prove one of the world's greatest oilfields, there being 350,000 square miles of geological formations favorable to petroleum. The difficulty in connection with the development of the natural resources of this far northern country is lack of transportation in the winter. In the summer the great rivers are navigable, thus rendering the problem of ingress and egress less formidable.

MINE HOISTS

Steam, Electric or Belt

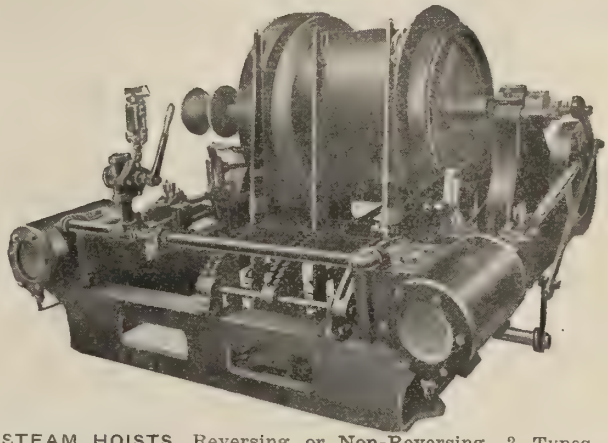
Any size you want up to 50 H. P.



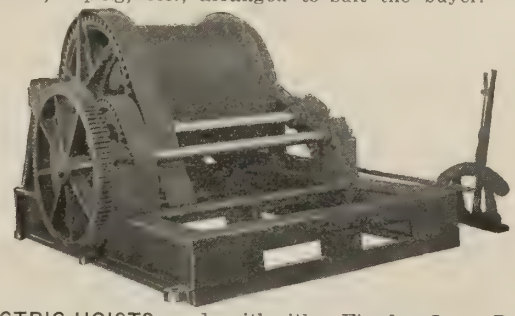
BELT HOISTS, made in the same large range of sizes as the Steam and Electric Hoists.

All our Hoists are properly built to withstand hard usage. They are simple in construction, do not easily get out of order, and the repair bill is exceedingly small.

Send for Catalogue.



STEAM HOISTS, Reversing or Non-Reversing, 2 Types—Drums Friction Driven, or keyed to shaft. Operating Levers, Piping, etc., arranged to suit the buyer.



ELECTRIC HOISTS, made with either Fixed or Loose Drums. Hoist above illustrated has Fixed Drum, Intermediate Gears, and extended base ready to receive the motor.

Mine Winding Engine for Immediate Disposal

Specifications:—

Double Drum, double Cylinder, direct drive high-speed Winding Engine, Cylinders 14 x 42. Reverse Link Motion. Pistons 21¼" diam. Cross head shoes adjustable to take up wear between the slides. Running in V shape slides: Length of Engine Bed Castings (suspended) from rear cylinder cover in centre drum shaft, 16'; Solid Crank Wheels 4' diam., 3½" Rim, keyed on to Drum Shaft 6½" diam. Hollow Drums, 3'6" diam. x 4' Winding Space, Flanges 3'. Each Drum fitted with adjustable Expansion Clutch operating inside outer rims. Each Drum fitted with Band Brake—operated by Independent Levers. Overhead Throttle with Drop Lever and Lubricator.

Lever Bank:—1, Engine Reverse Lever; 2, Brake Band Levers; 2, Clutch. Long Powerful Levers operating on floor stand quadrants.

THE PRICE OF SILVER.

Mining Interests in the Cobalt silver district are are evincing a good deal of interest in the activities of the so-called "Silver League", in the United States. Should the efforts of the League be successful, and result in the removal of the fixed maximum price of silver, or perhaps an increase from 101.½ cents to $1.25 cents an ounce, the development would be of extreme importance to the silver mines of this country. Not only would it result in greater earnings on present ore, but should serve to add tonnage, in that a large amount of low grade material not classified as commercial ore with silver at the current quotations, could be profitably treated following an increase in price.

INCREASED ACTIVITY IN GOLD MINING.

There is every indication that the increase in activity in gold mining is to result in very important developments this year. In some lines of industry there are so many difficulties to be overcome that the return to normal conditions is being very slowly made. In the case of gold mining we will not have a return to pre-war conditions, but rather an expansion that will make pre-war operations look small. Porcupine and Kirkland Lake areas will soon be producing on a larger scale and the less developed gold areas will also receive attention.

MINING.

Treatment of Silver Ore at Nipissing Mine.

In his report on operations during the past year, general manager R. B. Watson says of the results obtained by the allcyanide process:

"The process which has heretofore been used in the treatment of our high grade ores and which gave satisfactory results for seven years, is an amalgamation process, using a large quantity of mercury. The price of mercury before the war was $33.00 to $39.00 per flask of 75 lbs. Demand for war purposes raised the price to $130.00 per flask. This so increased the cost of the process that it was decided to discontinue amalgamation and rely on cyaniding alone, after giving the ore a preliminary treatment with bleaching powder in the tube mill.

"The necessary apparatus for this process was installed in the low grade mill at a small cost, and in August last the old high grade mill was shut down. The new process is working smoothly and will be used as long as it shows a saving over amalgamation."

In the low grade mill there was treated during 1918 80.274 tons ore containing 1.911.198 oz. silver and 43 tons by-products containing 116.066 oz. silver. There was recovered 1.796,923 oz. silver or 87.95 per cent. The average tailing contained 2.82 oz. silver per ton.

In February 1918, thirteen roughing tables were installed over the tube mills, and in April, sixteen fine sand tables were added.

"The ore is crushed by stamps in cyanide solution and goes to the roughing tables without classification. The tailing is classified; the sand is recrushed in tube mills; the overflow from the classifier goes to the fine sand tables. The tube mill discharge is returned to the classifier; the tailing from the fine sand tables is cyanided.

"By this method 48% of the silver in the ore is recovered in the form of concentrate, 40% as precipitate from the cyanide plant, and 12% goes to waste.

"The concentrate is re-treated with the high grade ore in the high grade mill and the precipitate from both treatments is sent to the refinery where it is converted into bullion.

"This process gives a better extraction and at less cost than can be obtained by cyanide alone on the quality of ore now being produced; due consideration must be given for the value of the cobalt in the concentrate.

"Forty stamps ran 323 days, or 88.49% of the possible dunning time; they crushed 248 tons per day or 6.98 tons per stamp per day."

DEVELOP CLAIMS OR FORFEIT THEM.

In connection with the problem of finding a remedy for the existing laws which permit large areas of territory to become staked out and held in idleness, the suggestion that all claim holders should have to perform perpetual assessment work or pay its equivalent in taxation, has apparently met with no concrete opposition, and has found considerable favor in the eyes of not a few prospectors.

Genuine prospectors look upon the frequent amendments to the Mining Act of Ontario as the very reason for the Act being perhaps the most satisfactory ever compiled. The genuine prospector is as far from being a "land grabber" as a racehorse is from being a donkey. As for the frequency of amendments to the Mining Act, the present day prospectors have to thank the untiring and sincere effort of far-sighted men for these very amendments which are serving to keep the mining laws up to date. In order to keep such laws from becoming obsolete it is necessary to continually add desireable amendments. Very recently the prospectors received the benefit of an amendment which permits the cost of survey to apply as so much assessment work done.

The properties like the Nipissing, Miller, Lake-O'Brien, Dome, Hollinger, Tough-Oakes and dozens of others, were developed into important mines, not through being held in idleness, but through the unremitting efforts of their owners. These properties, without exception, were worked almost continually without such work the prospectors and the country would not be reaping the present great advantages which have accompanied the successful development of such mines.

If assessment work were to be perpetuated on mining claims, and before such an amendment should be made, it is unquestionably true that "land grabbing" on the

part of so-called settlers should also be remedied. Truly, it would not be just to single out any one set of individuals as being responsible for the present conditions, but the fact remains that large areas are being held in idleness by reason of patent having been secured on mining claims and the only apparent remedy lies in perpetuating assessment work or imposing its equivalent in taxation. Such would not mean that annual trips to mining claims would be necessary, in that work could be done as far in advance as desired, but it would mean that the game of watchful waiting would cease.

The writer has spent a good deal of time in the majority of the mining camps in Canada, the time, for the greater part, being spent in the capacity of a prospector. In each case, that old adage "when in Rome do as the Romans do," has been adhered to. This has been particularly true in Northern Ontario, where the mining laws appear to be better than any others in the world, and where any prospector should be pleased to apply his efforts, and where we have the advantage of a Bureau of Mines that at all times is endeavoring to add to the efficiency of the mining laws.

The Journal solicits expressions of opinion from mining men and prospectors with regard to the advisability of supporting a plan to perpetuate work on mining claims, believing that such would prove beneficial to the genuine prospector. A wholesome discussion of the subject should be beneficial.

The suggestion appears to have already won a good deal of favor, not only among the prospecting fraternity, but with the Mining Commissioner for Ontario, as well as among members of the Canadian Mining Institute.—J. A. McR.

Western coal operators are asking for an independent board to take control of the coal industry in the West. This would indicate approval of the work of Mr. Armstrong who, during the war has been Director of Coal Operations in District 18.

The discontinuation of British Government purchases of ores of molybdenum and tungsten has evidently been caused by the over supply on the market. This will be unwelcome news to those who opened molybdenite mines during the war.

The conferring of the honorary degree of LL.D. on Emeritus Professor William Nicol was a well merited distinction. Professor Nicol has been for nearly thirty years a teacher at Queen's University and an enthusiastic one. He has to his credit a large share of the success of the School of Mining, where he trained many a student in the use of powers of observation. He had a passionate love for the school and its work, and did everything in his power to make it efficient. As a teacher of mineralogy, he endeavored to obtain for each student a collection of representative minerals, for he is a strong believer in the objective method, which has recently been championed by Mr. Corless. He took such a personal interest in all his students that there is peculiar satisfaction to them in learning that "Billy" Nicol has been honored by his university.

According to reports of hearings before the Industrial Relations Commission in Calgary last week the operators present did not favor the appointment of a joint council of employers and employees because most of the miners are foreigners whose ignorance made them a prey to agitators. It is unfortunately true that in most mining districts there is a large proportion of foreigners, most of whom cannot understand the English language, and that these men are commonly used as tools, by agitators. But should we not endeavor to do something to remedy this condition of affairs? Can we make progress so long as the same old objections are accepted as insurmountable obstacles: If we are to continue to use foreigners, should we not attempt to make good intelligent citizens of them? What is being done in the mining communities to counteract the propaganda of professional disturbers?

COMPARATIVE COST OF MATERIALS.

In the report of Mr. D'Arcy Weatherbee, of the Mining Corporation of Canada there is published the following comparative summary of material costs. It will be seen that practically every item increased in 1918 over 1917. Since the Armistice, however, a tendency to lower prices is indicated and it is hoped that 1919 will show a general reduction.

	Dec. 1913	Dec. 1915	Dec. 1916	Dec. 1917	Dec. 1918
40% Forcite ..... Price per 100 lbs.	$12.98	$12.98	$20.58	$24.75	$24.75
60% " ..... " " " "	15.98	15.98	25.58	31.75	31.75
No. 8 Detonators ..... Price per 100	1.19	1.72	2.70	2.70	2.70
Fuse ..... Price per case (6,000 ft.)	23.85–24.35	26.60	28.60	33.20	43.80
Mine Rails ..... Price per ton	43.50–45.00	48.00	52.00	100.up	100.up
Steel Sheets 3-16 ..... Price per 100 lbs.	2.90	2.75	5.43	10.00	12.00
" " 1/8 ..... " " " "	3.00–3.20	2.90	6.00	7.25	12.00

" 3" ..... " " "	24.71	24.72	44.89	63.86	67.34

MINING CORPORATION.

In the report on exploration of new properties Mr. D'Arcy Wetherbe, consulting engineer of the Mining Corporation of Canada says in part:

Efforts were continued in 1918 to secure a suitable property for exploitation, but, although out of many investigated several have distinct merit, only one has been acquired. In Canada and the United States 160 proposals were considered against 90 in 1917, and a large number of these were examined by your engineers. In the Cobalt district, four properties were examined and extensive work was done on three of them. All were rejected, however, as no ore bodies were proved. At North Cobalt a property is now being actively prospected, though nothing of value has as yet been found.

In the Casey district, the Mining Corporation, working under option, is developing the "Nels Nelson" and other claims, where, in 1914, a shaft was sunk on a vein to a depth of 40 feet, but has since lain idle. This shaft, known as No. 5, has been equipped with head frame, hoist and pumps, and the necessary buildings. It is to be sunk to the Keewatin contact, which several diamond drill holes have shown to lie, in this neighborhood, at an approximate depth of 350 feet. Cross-cuts will be driven from this shaft, both at the 220 foot level and from a level near the contact, northeasterly and southerly, closely following the plan suggested by the writer in 1914, of which details were at that time issued to the shareholders of the Casey Cobalt Silver Mining Company. This shaft, at the close of 1918, has reached a depth of 280 feet.

Of the other prospects in Northern Ontario, the "Rickard," on preliminary examination, showed rich gold ore near the surface, but after a campaign of drilling and underground work, occupying over six months, very discouraging results forced its abandonment.

Near Madoc, in Eastern Ontario, a vein of fluorspar was examined and finally acquired and a separate Company controlled by your Corporation was formed for its exploitation. A plant has been installed and a power line built to the property by the Ontario Hydro Electric Comission. Development work has reached a depth of 200 feet, and a body of ore of good quality has been partially exposed. Shipments of this ore have been made to several buyers under contract, and are expected to be resumed shortly. Depending on the future market condition, and on the results of further development of the ore body, the venture seems promising.

In British Columbia, and at other places in Western Canada, several properties, examined or considered, were all decided to be unsuitable for acquisition, and the options were given up.

Shareholders will have heard of the tragic news of the visit to Alaska, to examine the "Engineer" gold mines, by your Resident Manager, Mr. C. E. Watson, and his assistant, Mr. Randolph, during which both these gentlemen, as well as one of the chief owners of the property, lost their lives under most distressing circumstances, in the sinking of the steamer Princess Sophia. No report on the examination was received and no further action has, under the circumstances, been taken.

NIPISSING'S SEARCH FOR NEW PROPERTIES.

In the report of the Nipissing Mining Company for the past year, general manager R. B. Watson, says:

A diligent search was made to acquire another mine for Nipissing; over a hundred different properties were examined either personally or by reports — mines situated in Canada, Arizona, California, Idaho, Missouri, Montana and Nevada.

Most of the work was done in Ontario where we had a scout in the field throughout the year. Fifty-three separate groups in fifteen townships in Ontario and Quebec were personally examined. The work done in the United States was in charge of another engineer.

Only two of these properties were taken over and operated and in neither case were the developments satisfactory. At Fort Matachewan on the Montreal River considerable surface work was done on a gold property, but the results did not justify its purchase.

At Butte, Montana, an interest was acquired in the Butte Copper Czar Mine by buying treasury stock, the proceeds of which were spent under our direction. The development was disappointing and the mine was closed down.

Search for new properties will be continued during the coming year.

COST OF PRODUCING SILVER AT NIPISSING MINE.

Based on production of 3,701,416 ounces silver.

		Per Ton Ore	Per oz. Silver Cents
Exploration	$ 108,227.	$ 1,329	2.92
Diamond Drilling	20,045.	.246	.54
Development	73,023	.897	1.97
Stoping	104,380.	1,282	2.82
Hauling Dumps	6.706.	.082	.18
Shipping Residue and Cobalt Ore	3,369.	.041	.09
Assaying and Engineering	9,968.	.122	.27
Administration and office	42,702.	.525	1.15
Camp Maintenance	9,091.	.112	.25
Insurance and Taxes	383,716.	4.713	10.37
General and Legal	12,923.	.159	.35
High Grade Mills	144,749.	1,778	3.91
Low Grade Mill	410,014.	5.037	11.08
Depreciation on Plant.	59,004.	.725	1.59

Corporation, N. Y. Office, and Travelling	20,660.	.254	.56
	$1,475,832.	$18.128	39.87
Less Rents,, Profit on Supplies Sold, Discount and Exchange at Cobalt.	31,481.	.387	.85
Total Cost of Production	$1,444,350.	$17.741	39.02

Merritt Collieries.

The Merritt Collieries Ltd. are opening up a new No. 3 slope. It is in the Diamond Vale field and when completed is expected to result in a material increase in the coal production of that section.

THE BRITISH COLUMBIA DEPARTMENT OF INDUSTRIES.

The mining industry of British Columbia is expected to be materially benefited by the Industrial Act which passed the last session of the Provincial Legislature. A deputation of returned soldiers made representation that action along these lines should be taken for the purpose, generally, of promoting industry and the development of the natural resources of the country. For this work an industrial Commissioner must be apopinted and this official and his assistants must have funds. The latter necessity has been foreseen by the granting of authority by the Legislature for the raising of the moneys required up to a certain set maximum. Mining men, as has been stated, are looking to see this move help them and the industry in which they are interested. They belive that, as British Columbia probably is more a mineral bearing area than anything else, those concerned with mining must receive the most assistance.

Following are the powers of the Department of Industries set out in seriatim form:

The powers of the Department of industries shall be:

(a) To provide for industrial research; to co-ordinate as far as possible all industrial investigation and research; and to collect and disseminate data emanating therefrom.

(b) To acquire and utilize in arts and manufactures the knowledge already existent in other countries.

(c) To carry out an economic survey of the natural resources of the province, and to furnish advice in regard to the best methods of utilizing such resources.

(d) To furnish advice with regard to the best methods for attacking industrial problems, for inducing industrial improvements, and for facilitating and encouraging manufacture in suitable localities;

(e) To co-ordinate various industries so as to obtain the best combined results and the exchange between user and manufacturer of manufacturing improvements and operating experience, and to bring together producer, manufacturer, and purchaser.

(f) To publish technical, scientific and statistical information, and to encourage technical and industrial study by all possible means;

(g) To enquire and report on and aid in the establishment of any industries in British Columbia where it appears that such industries can profitably be carried on.

(h) To consider and initiate scientific researches in connection with or for the promotion of primary or secondary industries in the province;

(i) To aid by loan, guarant or guarantee of securities on approved plans any enterprise calculated to encourage the economic and commercial manufacture of the natural resources or products of the province;

(j) To consider and deal with plans submitted by representative bodies of returned soldiers of British Columbia for promoting and providing for employment through the establishment of new industries and the development of existing industries;

(k) Generally for any other purpose calculated to promote the economic development of the province.

Oil Company Wants Concession in Peace River District.

The D'Arcy Exploration Company, which is the exploration agent of the Anglo-Persian Oil Company, is interested in the oil bearing possibilities of certain sections of British Columbia. A representative of the former concern has approached the Provincial Government seeking such concessions as would wararnt the investment of the capital required to thoroughly prospect the areas which are considered promising. The company's chief request is to be given control over a tract of land 60 miles square in the Peace River District immediately south of the block of land owned by the Dominion Government and lying directly west of the inter-provincial boundary. Two years are asked for to carry out necessary geological examination and three years more for drilling and other preliminary work. In return the company proposes that the Province shall receive one-eigth, or 12½ per cent. at the casing mouth of all oil discovered and produced.

Mr. C. F. Law, who is acting for the Company in its negotiations with the Government, points out that the tract of land asked for would be only about one-tenth of the vast Peace River Territory. Probably not more than one-tenth of the lands covered by a concession would be actually used in producing oil, as, of course, the land actually needed in producing oil is a small proportion of what must be explored. The company, Mr. Law explains, seeks sole exploration rights within the area named. It is not willing to go in under the existing regulations, which would give it prospecting rights only. Thus, after the expenditure of much capital, it might find itself in the position of discovering oil on property not under its control. It has consented to pay 12½ per cent. royalty to the Government for the reason that a larger concession is being asked than is provided for under the existing laws. Provincial Statutes, it may be explained provide that oil producing companies shall pay a royalty of 2½ per cent. per barrel. Mr. Law wants the Government to act without delay. He states that to wait to place the matter before the Legislature at its next session would mean the waste of a year in exploration. He believes that oil will be discovered in quantity and hopes that the company will be permitted to proceed with its plans immediately.

Granby By-product Coke Ovens to be Operated June 1.

The Granby Consolidated Mining & Smelting Co.'s smelter at Anyox, resumed operations on Friday, the 4th of April, having been idle since the 2nd of March. The mine also was re-opened. Men to take the places of those who left last month were obtained in Vancouver and elsewhere in the Province, those who received and accepted or rejected applications giving preference to returned soldiers. The latter, therefore, are largely represented at Anyox at the present time.

Mr. F. M. Sylvester, the managing directorf of the company, who arrived the other day from New York, has made the interesting announcement that the new by-product coking ovens at Anyox will be opened on or about June 1.

There was one fatality in the metal mines of British Columbia during the first quarter of the present year as compared to three in the same period, 1918. The death referred to was caused by a skip in the shaft of the Surf Inlet Mine.

CANADA'S PRODUCTION OF CHEMICALS DURING THE WAR.

Canada, in the line of chemical industry and production during the war, stepped from a very lowly plane to one of high accomplishment, according to Mr. Noble W. Pirrie, director explosives for the Imperial Munitions Board, in an address given before the British Columbia section of the Society of Chemical Industry recently.

Mr. Pirrie spoke on the subject of the Canadian chemical war industry. He stated that what had been done in the matter of shell, steel and airplane production was now common knowledge, there was general public ignorance of the production of chemical plants. The vast sum of $15,000,000 had been expended in erecting chemical plants during the war and these, he added, had produced $200,000,000 worth of explosives. The war was a war of scientists and the scientists of Canada had performed a great research work in doing their share.

Dealing largely with the subject of the production of acetone, an essential in high explosives and propellants, he told how when the demand became acute the research experts of Canada and the United States bent their efforts toward increasing that production. The older method of producing from alcohol was used in the United States at first. This while not commercially successful under ordinary conditions resulted in a good, though not sufficient, production. Other methods were sought. In the United States another process wherein kelp was used was also taken up.

In Canada two new processes were discovered and proved, he continued. The erection of the great plant at Shawinigan Falls, and that at Trenton, and the utilization of the Gooderham & Worts distillery followed. In connection with the use of the latter establishment, he told how the owners of the property refused an offered rental and gave freely the use of their plant during the war.

The Shawinigan Falls plant was developed to be the largest acetic acid plant in the world, producing finally 1,600 tons monthly. The Gooderham & Worts plant, when the United States entered the war, was producing over 2,000 tons of explosives per year.

During the six months ending Oct. 16th, 1918, when the Trenton plant was wrecked by an explosion, the combined Canadian production, exclusive of private companies, was 25 per cent. of the entire production of nitric acid in the British Empire, 10 per cent. of another essential chemical, and 36 per cent. of a third. During that time 16,000 tons of guncotton were produced in the Empire and of this 8,000 tons were from Canadian plants. These figures, Mr. Pirrie stated after his lecture, did not include the production of plants such as that on James Island, British Columbia.

Mr. J. A. Dawson, of the Dominion Government chemical department here acted as chairman of the meeting. In his introductory remarks he spoke of the importance of Canada ever endeavoring to improve its research departments and pointed out the splendid results already obtained by Canada. In this he mentioned the highly creditable services given by several British Columbia chemists in war-time research, speaking particularly of Professor McIntosh of Trail, who did work in zinc production at the British Columbia plant before he was taken to more important work at the great Shawinigan Falls establishment.

Mr. Pirrie in answer to a question relating to the commercial possibilities of T.N.T. declared that in his opinion it had come to stay. It had superceded picric acid, it did not freeze, and it could easily be used either as a quick or slow burning powder. As to its safety he said that not a single pound of T.N.T. had ever been exploded through fire. He told of a carload through which a huge plate of steel fell without causing an explosion. In Mr. Pirrie's opinion T.N.T. will eventually be freely accepted as freight by transportation companies.

A hearty vote of thanks was extended to the speaker of the evening. Mr. Dawson, at the conclusion of the lecture and discussion, suggested the importance of a chemical research bureau in British Columbia.

BRITISH COLUMBIA COAL PRODUCTION.

A distinct improvement is apparent in the coal production of British Columbia during the month of March in comparison with that of February, there being a difference of approximately 28,000 tons. The total for March is about 223,000 tons. The reason definite figures are not given is that returns have not been received from one or more of the smaller of the province's producing mines. In March the Crow's Nest Pass Collieries were working at least five days a week, which is better than was done in February. It may be observed incidentally, in connection with the Vancouver Island output, that the new Wakesiah Mine of the Canadian Western Fuel Company, which was expected to be in operation by this date, is still in the development stage, the work of opening up the property having ceased some weeks ago.

Following are the detailed figures:

Coal Production of Vancouver Island for March, 1919.

	Tons.
Canadian Western Fuel Co., Nanaimo	58,005
Canadian Collieries (D), Ltd., Cumberland	56,158
Canadian Collieries (D), Ltd., Extension	22,090
Canadian Collieries (D), Ltd., South Wellington	7,281
Pacific Coast Coal Mines, South Wellington	5,298
British Columbia Coal Co., East Wellington	2,788
Nanoose Collieries, Limited, Nanoose	1,898
Granby Consolidated M. S. & P. Co., Cassidy	945
Total Vancouver Island	154,463

Coal Production for Nicola-Princeton District, March, 1919.

	Tons.
Middlesboro Collieries, Ltd. Merritt	4,616
Fleming Coal Company, Merritt	3,955
Columbia Coal Company, Coalmont	480

Coal Production for Crow's Nest Pass District, March, 1919.

	Tons.
Crow's Nest Pass Collieries, Coal Ck	32,834
Crow's Nest Pass Collieries, Michel	20,405
Corbin Coal Company, Corbin, B.C.	4,126
Total for District	57,365

Concentrating Plant for Bowena Copper.

The Bowena Copper Mine, which is under lease to C. W. Tipping, is to have a concentrating plant, instructions having been given for its installation. A shaft has been sunk and values obtained which are considered very satisfactory.

Destruction of Mine Property by the Huns

Frank H. Probert, consulting engineer of the United States Bureau of Mines, and dean of the College of Mining, University of California, member of a special American Commission to investigate the damage done by the Germans during the war to the coal and iron mines and steel works of France and Belgium, after a personal investigation, has just returned to Washington with a first-hand story of the almost unbelievable atrocities of the Hun in the destruction and wreckage of the Industrial life of France and Belgium. Mr. Probert, together with Dr. F. G. Cottrell, chief metallurgist of the Bureau of Mines, and George S. Rice, the chief mining engineer, made up the American mission sent to Europe last January on the invitation of the French High Commission. The purpose of this mission was not only to investigate the damage done, but to advise with the foreign officials concerning reconstruction and rehabilitation and assist in any way possible on matters pertaining to the mineral industry.

Mr. Probert visited the iron mines of Nancy, Briey, Longwy, and Luxemburg; coal mines in the Province of Saar, and the coal district of Pas de Calais. Details of the investigation will be published in an official bulletin of the U. S. Bureau of Mines within the next three months, until which time, no detailed statement is permissible. Letters of introduction from M. Loucheur, Minister of Industrial Reconstruction in France, assured the mission proper recognition, and every facility to expedite the work was given by the French government officials. On instruction cabled by Secretary of War Baker to General Pershing, rapid transportation was arranged and such other assistance as needed was placed at the disposal of the representatives of the Bureau of Mines. In no other way would it have been possible in so short a time to get as comprehensive an insight into the present-day condition of the mining industry of the Western front.

Mr. Probert, in a preliminary report to Van. H. Manning Director of the Bureau of Mines, has the following to say:

"Early in the war the German hordes swept southward through the iron basin of French Alsace and Lorraine, and for nearly four years this renowned mining area was held and exploited by the invaders. Many of the employees were made captives and compelled to work in the mines under German direction. The international boundary between France and Germany was drawn in 1871 to give the victor of the Franco-Prussian war control of the iron fields, but since that time scientific development, guided by a better understanding of the local geology, exposed for France a greater ore reserve at lower horizons than that of Lorraine Annexee. With the return of Alsace and Lorraine to the mother land, France will become the dominant factor in the future steel industry of Europe. During the German occupation, the iron mines were not intensively exploited because of the necessity of recruiting into the Teuton army every able-bodied man and on account of the large accumulation of war minerals in preparation for the war. The actual physical damage to the iron mines is relatively small when compared with the destruction of the coal fields of northern France, which was as reprehensible as it was completed. Only in a few cases, where pillars have been robbed, is there any collapse of underground workings in the iron mines, but the equipment, both surface and underground, has been misused, and where ore has been mined, the lack of development will defer realization of capital until the exploratory work is sufficiently advanced to admit of daily output approximating pre-war conditions. The mines are not seriously crippled, but what of the steel plants in which the iron ores are smelted? No such atrocity was ever perpetrated against the industrial life of any country. Magnificent plants, comparing favorably with anything in the United States, are now but a tangled, twisted mass of structural steel and broken stone. The wilful demolition was scientifically planned and systematically carried out. This after the removal of all such mechanical and electrical power units as could be used in Germany. The maliciousness and efficiency with which this crime against French industry was conducted is almost unbelievable.

"In the coal districts of Pas de Calais and Nord, a sector fought over from the beginning to the end of the war, changing hands frequently, bombarded all the time, all surface structures whether of town, village or mining enterprise have been razed. This may be legitimate warfare, but now that the guns are silenced and the frenzy of combat is past, it is horrible to look upon. Arras, Douai, Bethune, Bapaume, Lens, Loos, Courriere, centers of coal-mining activity but a few years ago and the mainspring of French industrial life, are gone, but the indomitable spirit of France survives and already plans are laid for the future. Bruay, at the western edge of the known coal field, was not in the fighting zone and its output has been steadily maintained, but going eastward the frightfulness is more and more appalling, for the hate of the Hun left its mark on the mines during his forced retreat. The coal measures are overlain by water-bearing strata, necessitating special methods of shaft sinking and support to keep the mines dry. The steel lining of the shafts was dynamited, letting in the quick sands and flooding the underground workings for many miles. In the entire Pas de Calais region it is estimated that 120 million cubic meters of water must be pumped before mining operations are resumed. Having flooded the mines, the headframes and surface equipment were systematically dynamited, the twisted debris in many cases filling up the demolished shafts. It will probably be five years before this coal district can be rehabilitated and twelve to fifteen years before it gets back to normal pre-war output. The first great need is for building in which to house the workman.

"The Saar coal fields were visited by the Bureau of Mines officials. Here, in striking contrast to the mining districts of France and Belgium, the coal industry is at its height. German workmen and German engineers are still employed, but under the direction and supervision of French officers. A spirit of unrest is apparent everywhere, the suspense of the peace negotiations, uncertainty as to indemnity to be exacted and lack of food, is telling on the already broken morale of German workmen. Unfortunately the Saar coal does not give a desirable metallurgical coke to the

French and the blast furnaces now running are working inefficiently. Westphalian coal is much desired and a special committee of which George S. Rice of the Commission is a member left for Cologne to investigate the possibilities of early shipment from Westphalian to France.

"The French attitude toward her allies is an interesting psychological study. France has been hurt, really hurt by the long conflict. She has suffered perhaps more than any other nation, the battles have been fought mostly on her soil, her manhood has been drained of its best and most productive blood, her industries, her economic mainsprings have been ruthlessly destroyed. These two classes of French thought are desirous that France rebuild herself, financed by German indemnity. They seek neither mony nor advice from others; the irrespressible spirit will be all sustaining. Directors of industry, mine owners and employers of labor, possessed of the same love of country, look on the problem from another viewpoint. They claim that money borrowed from other countries at reasonable interest rates, new equipment for mines and plants purchased from America for early delivery, will admit of an earlier return to pre-war scale of operation and the higher immediate cost will be more than offset by the earlier realization of profits from natural resources and raw materials.

"It would be presumption on the part of an American mining engineer to suggest improvements in methods or practice in French mining. The French engineers have long known their own problems and have solved them in accordance with their system of finance and amortization. Their mines are developed and equipped with the idea of permanent industry and unless there is serious labor unrest and extraordinary advances in wage scales, the old French practice is peculiarly suited to French conditions. Their policy is progressive. There is constant search for new mineral areas or extension of proven deposits. French Lorraine has greater iron ore reserves than those of Lorraine Annexee, and just before the outbreak of war, drill holes had shown the extension of the coal measures of Pas de Calais to the south. Iron and coal are complementary minerals. France has them both in larger quantity than in 1914, and when her reconstruction program is carried out, the steel industry will be among the first assets of a land that has suffered greatly."

Ore Receipts at Trail.

Ore and concentrates to a weight of 96,542 gross tons have been received at the Canadian Consolidated Mining & Smelting Co.'s Plant, Trail, B.C., during the first three months of the present year. This compares with 103,118 tons for the corresponding period in 1918, and with 120,486 tons for the first quarter of 1917. It will be appreciated, of course, that the last mentioned years were affected by war conditions. It is well known that, because of present conditions, the smelter management is not seeking ores of any kind. No ore is being accepted from the American side of the line; in fact, 85 per cent of that which is received and treated comes from the company's own properties. Up to the present date only 60 outside properties have shipped to Trail this year.

The monthly details for the first three months of 1919, together with similar figures for the previous two years, follow:

	1917.	1918.	1919.
January	36,570	27,404	35,283
February	40,967	33,989	30,450
March	42,949	41,725	30,809
Tons	120,486	103,118	96,542

COWICHAN MANGANESE DEPOSITS.

It is reported by Mr. G. C. Mackenzie, late of the Canadian Geological Survey Branch, Ottawa, that all available information relating to the Manganese Deposits of the Cowichan District, Vancouver Island, will be published shortly by the Canadian Munition Resources Commission.

Mr. Mackenzie reports on his investigations in August and November in the ore area situated near Cowichan Lake, at the summit of the divide between Chemainus and Cowichan Rivers. He says of the August investigation:

"The ore-body appears to be associated with the quartzite rocks of the Sicker series and consists of manganite and, possibly some psilomelane, which has undoubtedly been derived from the alteration of rhodonite, the silicate of manganese, which is strongly in evidence on both sides of the orebody. Samples taken across the widest portion of the outcrop indicated approximately twelve feet of ore with a metallic manganese content of better than fifty per cent., and with less than fifteen per cent. of silica. Phosphorus was found to be present in amounts generally less than .075 per cent."

After the November examination Mr. Mackenzie says:
